Brief Contents

UNIT I Foundations of Thoughtful, Person-Centered Nursing Practice

Chapter 1 Introduction to Nursing and Professional Formation

Chapter 2 Theory, Research, and Evidence-Based Practice

Chapter 3 Health, Wellness, and Health Disparities

Chapter 4 Health of the Individual, Family, Community, and Environment

Chapter 5 Culturally Respectful Care

Chapter 6 Values, Ethics, and Advocacy

Chapter 7 Legal Dimensions of Nursing Practice

Chapter 8 Communication

Chapter 9 Teaching and Counseling

Chapter 10 Leading, Managing, and Delegating

UNIT II Health Care Delivery

Chapter 11 Health Care Delivery System

Chapter 12 Interprofessional Collaborative Practice and Care Coordination Across Settings

UNIT III Processes of Thoughtful, Person-Centered Practice

Chapter 13 Blended Competencies, Clinical Reasoning, and Processes of Person-Centered Care

Chapter 14 Clinical Judgment

Chapter 15 Assessing

Chapter 16 Diagnosis/Problem Identification

Chapter 17 Outcome Identification and Planning

Chapter 18 Implementing

Chapter 19 Evaluating

Chapter 20 Documenting and Reporting

Chapter 21 Informatics and Health Care Technologies

UNIT IV Developmentally Appropriate Care

Chapter 22 Developmental Concepts

Chapter 23 Conception Through Young Adulthood

Chapter 24 Middle and Older Adulthood

UNIT V Actions Basic to Nursing Care

Chapter 25 Asepsis and Infection Control

Chapter 26 Vital Signs

Chapter 27 Health Assessment

Chapter 28 Safety, Security, and Emergency Preparedness

Chapter 29 Complementary and Integrative Health

Chapter 30 Medications

Chapter 31 Perioperative Nursing

UNIT VI Promoting Healthy Physiologic Responses

Chapter 32 Hygiene

Chapter 33 Skin Integrity and Wound Care

Chapter 34 Activity

Chapter 35 Rest and Sleep

Chapter 36 Comfort and Pain Management

Chapter 37 Nutrition

Chapter 38 Urinary Elimination

Chapter 39 Bowel Elimination

Chapter 40 Oxygenation and Perfusion

Chapter 41 Fluid, Electrolyte, and Acid–Base Balance

UNIT VII Promoting Healthy Psychosocial Responses

Chapter 42 Self-Concept

Chapter 43 Stress and Adaptation

Chapter 44 Loss, Grief, and Dying

Chapter 45 Sensory Functioning

Chapter 46 Sexuality

Chapter 47 Spirituality

Index

Resources available on thePoint

Glossary

Appendix A Guidelines for Delegation Decision Making

Appendix B Equivalents

Appendix C Adult Laboratory Values

This work is provided “as is,” and the publisher disclaims any and all warranties, express or implied, including any warranties as to accuracy, comprehensiveness, or currency of the content of this work.

This work is no substitute for individual patient assessment based upon health care professionals’ examination of each patient and consideration of, among other things, age, weight, gender, current or prior medical conditions, medication history, laboratory data and other factors unique to the patient. The publisher does not provide medical advice or guidance and this work is merely a reference tool. Health care professionals, and not the publisher, are solely responsible for the use of this work including all medical judgments and for any resulting diagnosis and treatments.

Given continuous, rapid advances in medical science and health information, independent professional verification of medical diagnoses, indications, appropriate pharmaceutical selections and dosages, and treatment options should be made and health care professionals should consult a variety of sources. When prescribing medication, health care professionals are advised to consult the product information sheet (the manufacturer’s package insert) accompanying each drug to verify, among other things, conditions of use, warnings and side effects and identify any changes in dosage schedule or contraindications, particularly if the medication to be administered is new, infrequently used or has a narrow therapeutic range. To the maximum extent permitted under applicable law, no responsibility is assumed by the publisher for any injury and/or damage to persons or property, as a matter of products liability, negligence law or otherwise, or from any reference to or use by any person of this work.

We jointly dedicate this special 10th edition written during the COVID-19 pandemic and the 2020–2021 Years of the Nurse and the Midwife, honoring the 200th anniversary of the birth of Florence Nightingale. We dedicate this text to all nurses everywhere who continue to care for society's most vulnerable and to the educators preparing the next generation of nurses to continue this service. May we always earn recognition as the most trusted profession.

—Carol, Pam, and Jennifer

A Special Note From the Author Team

This text and every element in the teaching–learning package have been revised during a time that none of us could have envisioned. We have written and rewritten numerous chapters too often to count as new developments within our global community, country, and profession commanded our attention and begged to be brought to yours! Never have we been prouder to be nurses, and never have the demands on our expertise, energy, commitment, and resilience been greater. We recently read that nurses today need dedication, strength, grit, resilience, innovation, and kindness. We would add love, love for humanity, including love for self. So what are some of these new developments?

- As the American Nurses Association celebrated its 125th anniversary, it released the fourth edition of its *Scope and Standards of Practice* in May 2021. A major revision, this edition includes a new definition of nursing which references the art and science of caring, human functioning, compassionate presence, and recognition of the connection of all humanity.
- Earlier in 2021, the American Association of Colleges of Nursing released the re-envisioned *Essentials* that define competency requirements for baccalaureate and graduate nursing program graduates. These will revolutionize how nurses are prepared for entry-level and advanced roles.
- The National Council of State Boards of Nursing (NCSBN) announced the new Next Generation NCLEX (NGN) promising to incorporate the assessment of clinical judgment utilizing new evaluation model and question design.
- Simultaneously, the National Academies of Sciences, Engineering, and Medicine released *The Future of Nursing 2020–2030: Charting a Path to Achieve Health Equity*. This report outlines and affirms the role nurses can play in creating healthy communities for all. Understanding the dramatic changes the health care industry is undergoing, this report summarizes the challenges health care and the nursing profession are likely to face in the future and discusses steps for overcoming them, including how nurses can:
  - Work over the next decade to reduce health disparities and promote equity
  - Address rising costs through more equitable care delivery
  - Use technology to maximize reaching vulnerable populations
  - Prioritize patient- and family-centered care
- The COVID-19 pandemic continues to stretch every sector of health care, including our nurse leaders and front-line caregivers, to dig deep and give all they have to meet daunting demands for care.
- Disparities in health care, for far too long, have gone unacknowledged. Diversity, inclusion, and equity require active engagement.
- Similarly, climate change is no longer a theory, as massive fires, flooding, drought, and other climate extremes ravage the globe. What every nurse can do to promote environmental health and essential contributions.

PREFACE

Today's competitive, market-driven health care environment is challenging the very nature of professional nursing practice. *Fundamentals of Nursing: The Art and Science of Person-Centered Care, Tenth Edition*, promotes nursing as an evolving art and science, directed to human health and well-being. It challenges students to cultivate the Quality and Safety Education for Nurses (QSEN) and blended competencies they will need to serve patients and the public well. Our aim is to prepare nurses who combine the highest level of scientific knowledge and technical skill with responsible, caring practice. We want to challenge students to identify and master the cognitive and technical skills required of a nurse. But we also intentionally integrate other core content including interprofessional/intraprofessional/interpersonal communication, ethical comportment, legal regulations and standards, population health principles, and a systems-based perspective to facilitate the development of the student nurse as a member of the profession. We refuse to allow love of humanity, accountability, caring relationships, compassionate presence, and advocacy to become relics of a bygone era.

Those new to nursing can quickly become overwhelmed by the demands placed on the nurse's knowledge, technical competence, interpersonal skills, and commitment. Therefore, much care has gone into the selection of both the content in this edition and the manner of its presentation. We strive to capture the unique essence of both the art and science of nursing, distilling what the person beginning the study and practice of nursing needs to know. We invite students to identify with the profession, to share in its pride, and to respond to today's challenges competently, enthusiastically, and accountably. The Gallop Poll for 2021 noted that nurses earned the most trusted professional distinction for the 20th year. We hope to provide an opportunity for students to appreciate how their individual, unique talents contribute to and strengthen the profession of nursing.

LEARNING EXPERIENCE

This text and the entire Taylor Suite have been created with the student's experience in mind. Care has been taken to appeal to all learning styles. The student-friendly writing style ensures that students will comprehend and retain information. The updated art program and strong features enhance understanding of important concepts. The textbook features, interrelated Fundamentals products, and associated CoursePoint resources have been intentionally developed and integrated to provide a consistent, cohesive learning experience.

ORGANIZATION

Fundamentals of Nursing: The Art and Science of Person-Centered Care, Tenth Edition, is organized into seven units. Ideally, the text is followed sequentially, but every effort has been made to respect the differing needs of diverse curricula and students. Thus, each chapter stands on its own merit and may be read independently of others. Nursing Concepts lists in each chapter opener highlight connections to fundamental nursing concepts and support ease of identification, especially for concept-based nursing programs.

Unit I, Foundations of Thoughtful, Person-Centered Nursing Practice

Unit I opens with a description of contemporary nursing. Successive chapters introduce content foundational to nursing practice: theory, research, and evidence-based practice; health, illness, and disparities; health of the individual, family, community and environment; cultural diversity; values, ethics, and advocacy; legal dimensions of nursing practice; communication; teaching and counseling; and leadership, managing, and delegating.

Unit II, Health Care Delivery

Unit II is completely revised in light of the continuing changes in health care delivery. The new content highlights nurses' expanding roles in care coordination as partnerships are forged with patients, families, local and global communities, and the populations we serve. Chapters address the variety of community-based health care settings; continuity of care as the patient enters a health care facility, is transferred within the facility, and is discharged into another setting within the community; and care provided within the home. This unit highlights ANA's Principles for Health System Transformation, IHI's quadruple aim, new information on Reliability Care Accountability Matrix, and updated health care reform information that emphasizes nurses' contributions.

Unit III, Processes of Thoughtful, Person-Centered Practice

Unit III offers a thoroughly revised and detailed, step-by-step guide to each component of the nursing process with practical guidelines and examples included in each chapter. Each chapter concludes with a section on "Reflective Practice Leading to Personal Learning" that invites readers to look at their experience with each step of the nursing process, understand it, and learn from it. The goal is always to invite reflection on how we can improve our thoughtful,

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

person-centered practice.

Chapter 13 offers a careful introduction to thoughtful, person-centered practice with expanded content on theories of caring, clinical reasoning, clinical judgment, decision making, and reflective practice. Separate chapters address the nursing process as a whole: Quality and Safety Education for Nurses (QSEN) and blended competencies, clinical reasoning, clinical judgment, assessing, diagnosing/problem identification, outcome identification and planning, implementing, and evaluating. Chapter 14 is a new chapter dedicated exclusively to clinical judgment that describes new features in the text. Chapter 16, previously focused on nursing diagnoses, now has a new focus on analyzing and hypothesizing to identify patient problems and needs. Chapter 20 includes expanded content on privacy guidelines and standards for social media, electronic health records (EHRs), reporting, and conferring. Chapter 21, Informatics and Health Care Technologies is responsive to what today's nurses need to know about how best to use new technologies and information to coordinate care and achieve desired outcomes. There is recognition that more health care facilities and organizations are combining virtual services with in-person care to ease hospital burden and provide better patient experiences and satisfaction. Central to this transition is telehealth, remote monitoring, and mobile care teams.

Unit IV, Developmentally Appropriate Care

Unit IV provides the basis for understanding growth and development across the lifespan and acknowledges nursing's differing requirements arising from the various developmental stages and abilities to meet developmental tasks. This content is framed to recognize the historical context and core tenets of developmental theories, while reinforcing that inclusivity and acceptance without bias are essential to good nursing care.

Unit V, Actions Basic to Nursing Care

Unit V introduces the foundational skills used by nurses: maintaining asepsis, measuring vital signs, assessing health, promoting safety, incorporating complementary and alternative therapies, administering medication, and caring for surgical patients. Chapter 29 was reorganized around the person-centered, systems-based, and population-based aspects of safety and security to intentionally integrate the spheres of practice and highlight three new domains in AACN's *Essentials*: person-centered care (domain 2), systems-based practice (domain 7), and population health (domain 3). Chapter 31 relies on guidance from professional nursing organizations with expertise in perioperative nursing.

Unit VI, Promoting Healthy Physiologic Responses

Unit VI explores the nurse's role in helping patients meet basic physiologic needs: hygiene; skin integrity and wound care; activity; rest and sleep; comfort and pain management; nutrition; urinary elimination; bowel elimination; oxygenation and perfusion; and fluid, electrolyte, and acid–base balance. Chapter 33 contains the latest guidance on pressure injury prevention, staging, and management. Chapter 36 addresses the opioid crisis and challenges students to consider different perspectives regarding legal ramifications and related structural disparities. Chapter 40 includes cardiovascular content as it pertains to its role in oxygenation. In each chapter, guidelines are included for assessing and diagnosing unhealthy responses and for planning, implementing, and evaluating appropriate care strategies.

Unit VII, Promoting Healthy Psychosocial Responses

Unit VII uses the same format as Unit VI to focus on the psychosocial needs of patients: self-concept; stress and adaptation; loss, grief, and dying; sensory functioning; sexuality; and spirituality.

THEMES

The following themes are interwoven throughout the text to provide a broad knowledge base of nursing essentials while emphasizing holistic care.

Thoughtful Person-Centered Care

Our subtitle reflects today's emphasis on person-centered care. Readers will now see an even stronger emphasis on clinical reasoning, clinical judgment, decision making, and reflective practice in every chapter. Central to this model are the nurse's personal attributes, knowledge base, and clinical experience; clinical reasoning, clinical judgment, and decision making; patient-centered nursing process; and reflective practice leading to personal learning.

Nursing as an Art and Science

Nursing as a science is characterized by a growing body of knowledge that links technical and interpersonal interventions to desired patient outcomes; as an art, nursing demands of its practitioners sufficient competency to creatively design individualized strategies to assist patients to reach personal health goals. A unique spirit of caring always must prevail.

Professional Formation of the Nurse

Responding to emphases in the AACN's *Essentials*, this edition weaves content about the professional formation of the

nurse into every chapter. The goal is to form students who own the professional identity of the nurse and are intentional about developing the character and values of the nurse as well as the knowledge, skills, and attitudes. Every effort has been made to incorporate content from the ANA *Nursing: Scope and Standards of Practice* (4th ed.), AACN's *Essentials,* and the National Academy of Sciences, Engineering and Medicine's *The Future of Nursing 2020–2030.*

Integrated Nursing Process

After the nursing process is introduced in Unit III, it provides the organizational framework for successive chapters. The *2021 Nursing Scope and Standards of Practice* highlights the continuing importance of nursing process:

> Regardless of the theoretical knowledge base upon which nursing and its practice are derived, that knowledge fits within the multidimensional nursing process, the analytical, critical-thinking framework guiding professional thinking and activities.

Chapters in Units VI and VII, which deal with physiologic and psychosocial responses, begin with a succinct background discussion of the concept, followed by identification of factors that influence how different individuals respond to these needs. Phases in the nursing process are used to describe related nursing responsibilities. Throughout these chapters, students will find numerous practical examples of how to conduct focused assessments; develop and write problem statements; identify goals and outcomes; and select, implement, and evaluate appropriate nursing interventions. These examples will reinforce the student's mastery of nursing process skills. Some chapters in Units VI and VII conclude with a Nursing Care Plan that illustrates each phase of the nursing process and a sample documentation of nursing assessment or intervention. Others feature Evolving Case Studies based on NCSBN's model of evolving cases with directed questions at each level of the Clinical Judgment Measurement Model. The answers to these cases are included only in the instructor materials to allow nurse educators to use them as desired. In addition, Concept Maps demonstrating the nursing process are included in several chapters. The basic concept map structure for nursing students just starting to consider the nursing process incorporates: (1) beginning pathophysiologic principles, laboratory values, and medications; (2) actual and potential patient problems; and (3) related nursing interventions. Concept mapping provides the learner the opportunity to visually depict and explore connections between disease processes, problems identified by nurses, and individualized nursing interventions. Although concept maps can take many forms, the beginning maps in this text focus on identifying connections using a specific format that provides students a starting point for mapping. The concept map in Chapter 31, Perioperative Nursing, depicts a different structure, designed to show students a way to organize their thoughts as they begin to think like nurses.

Critical Thinking, Clinical Reasoning, and Clinical Judgment

This edition describes carefully curated options that are discussed separately and in tandem to build ways of knowing through the lens of clinical judgment. Clinical judgment is foundational to what we do as nurses. Building a shared understanding of the elements fundamentally shifts the focus of students to the processes they will need to learn and apply. Addressed are:

- Tanner's (2006) Model of Clinical Judgment
- Lasater's (2007) Clinical Judgment Rubric
- Nielson, Stragnell, and Jester (2007) Reflection Tool
- Gibb's Model of Reflection (1988)
- Nursing Process

The 10th edition continues to invite students to reflect on their ability to be the critical difference for recipients of their thoughtful practice. The revised *Self-Reflective Practice* boxes, *Focused Critical Thinking Guides*, and *Developing Clinical Reasoning and Clinical Judgment* material in each chapter challenge students to use new knowledge and experience to "think through" learning exercises designed to demonstrate how careful thinking can change outcomes. The ninth edition added Reflective Practice Leading to Personal Learning content to Chapters 8 and 9 in Unit I and each of the chapters in Units III, VI, and VII. In addition to a brand-new chapter on Clinical Judgment, the 10th edition added a new feature, Thoughtful Person-Centered Practice: Challenging Topics, which offers evolving scenarios of challenging and relevant issues based on Tanner's Clinical Judgment Model (2006) and the reflection tool developed by Nielson, Stragnell, and Jester (2007). These exercises challenge students to reflect upon and critique how they would respond to real practice situations—each designed to promote their professional formation and ability to think, value, and practice like a nurse.

Competency Models

Competency models outline very specific tasks or goals and are directly related to the measurement of nursing clinical judgment. These competency models are used in the development, implementation, and evaluation of nursing curricula and accredited programs nationwide. Framing clinical judgment as an expectation explains the significance to students the moment they begin a fundamentals course. This text was organized initially around what was called blended competencies (cognitive, technical, interpersonal, and ethical/legal) and these were later complemented with QSEN—

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

this represents a history of embedding competencies, so this is not a new concept for this text.

- Competency Outcomes Performance Assessment Model (COPA, 1999/2009)
- QSEN influence: each chapter begins with "Reflective Practice: Cultivating QSEN Competencies"
- American Association of Colleges of Nursing (AACN, 2021): *The Essentials*
- National League for Nursing: *Competencies for Graduates of Nursing Programs* (2012) and *Hallmarks of Excellence in Nursing Education Model* (NLN, 2020)
- Competencies outlined in the revised ANA (2021) *Nursing Scope and Standards of Practice* 4th edition
- Interprofessional Education Collaborative (IPEC, 2016): *Core Competencies for Interprofessional Collaborative Practice*

Four Spheres of Care

The AACN 2021 *Essentials* noted that nursing education has historically emphasized clinical education in acute care. The first edition of our text did exactly that. But we quickly realized that students would be practicing in very diverse settings and that we needed to prepare them for these expanded roles, many in the community. We think you will see increased content in the 10th edition and examples of what *The Essentials* call the four spheres of care: (1) disease prevention/promotion of health and well-being, which includes the promotion of physical and mental health in all patients as well as management of minor acute and intermittent care needs of generally healthy patients; (2) chronic disease care; (3) regenerative or restorative care; and (4) hospice/palliative/supportive care.

Emphasis on Partnering With Patients, Families/Caregivers, and Professional Caregivers

Today, we have witnessed the health care "industry" transform patients to "customers," who buy health care (if they are able) as a commodity in the marketplace. We do not believe that a "customer orientation" serves patients or nurses well. One of our students shared her belief that she owes less to a "customer" and even to a "client" than she does to a "patient." We, therefore, use the term *patient*—in its most positive sense—to designate the recipient of nursing care, whether the patient is an individual, family group, or community. *Family* is defined by the patient and includes anyone they rely on for support, comfort, and care.

Careful attention is paid to directing students to identify, value, and develop the interpersonal skills that will allow them to effectively partner with patients, family, and professional caregivers. This edition highlights interprofessional collaborative practice and nursing strategies for actively engaging patients, family (as identified by the patient), guardians, caregivers, and the public in the development of health goals and strategies to achieve these goals.

Health, Justice, Equity, Diversity, and Inclusion

A health- rather than an illness-orientation provides a framework for presentation of content. This edition includes expanded content on the social determinants of health, health literacy, health disparities, and health equity. Special features such as *Promoting Health, Teaching Tips*, and *Health Literacy* boxes help to highlight this important content and new information on web-based resources for culturally respectful care is provided.

As nurses, we continue to practice in a health system plagued by disparities. As authors, we are committed to making health care work for everyone, especially the most vulnerable. While previous editions of this text highlighted the social determinants of health and offered practical resources for assessing special needs, for advocating for vulnerable individuals and groups, and for designing effective strategies to promote equity, the 10th edition heeds nursing leaders' call to prepare nurses who are anti-racist and highlights ANA's Standard on Respectful and Equitable Practice. New Vulnerable Populations Alerts are valuable additions to this edition.

Care has been taken to communicate that both nurses and patients may identify their gender and/or sexual orientation on a spectrum, and that they come from every racial and ethnic background and socioeconomic group. When not addressing a specific case, we have tried to avoid gender distinctions in personal pronouns. We also very intentionally differentiate the concepts of gender identity, gender expression, sexual identity, sexual orientation, and biological sex or sex assigned at birth—we focus on saying what we mean and only what is germane to providing nursing care. Every effort has been made to highlight diversity, equity, and inclusion themes and to use recommended language that honors each individual we describe. We understand that this language is changing rapidly and anticipate future modifications.

Health and Self-Care of the Nurse

If the pandemic taught us anything, it underscored the critical importance of the health and well-being of caregivers. In this edition, you will find a new Nurse Self-Care alert, enhanced content on wellness strategies and resilience.

Compassion Fatigue and Burnout

In our efforts to instill a commitment to service and excellence in our graduates, we have often failed as educators to address appropriate work/life balance challenges. Our ANA Code of Ethics continues to instruct nurses that their primary commitment is to patients, while at the same time reminding them they have duties to self. We directly address these challenges of commitment in the 10th edition with expanded content in Chapter 1, new Nurse Self-Care alerts

throughout the text, and highlighted resources for self-care.

Climate Change and Environmental Health

ANA's *Nursing: Scope and Standards of Practice* (2021) includes Standard 17, Resource Stewardship and 18, Environmental Health. The 10th edition added new content on environmental health, and the United Nations Sustainable Development Goals offers students practical strategies and climate actions they can use to partner in their communities to help limit global warming and take care of our planet.

Attention to Care of the Older Person

Because the age of the population is increasing, nurses encounter growing numbers of older patients in all practice settings. Chapter 24: Middle and Older Adulthood, the *Focus on the Older Adult* boxes, and general considerations for the older patients that appear within the text aim to sensitize students to the special nursing needs of this population. Readers of the 10th edition will find expanded information related to health disparities; a discussion of cascade iatrogenics; technology-based and online resources for older adults; expanded information on developmental and disability considerations; and updated guidelines for health-related screenings, examinations, and immunizations for the aging adult.

Healthy Work Environments

This edition addresses current issues of disruptive interpersonal behavior (including incivility and bullying), cyber terror, lateral violence, aggressive behavior, and nurses' use of social media to help readers understand what it takes to have a healthy work environment.

Evidence-Based Practice

Content on research and evidence-based practice has been updated and is included in Unit I for increased emphasis early in the learning experience. See the John Hopkins Evidence-Based Practice Model and new hierarchy of evidence pyramid. The updated feature, *PICOT in Practice: Asking Clinical Questions*, encourages readers to delve into research to solve a clinical question using the PICOT format and guidelines. Updated *Research in Nursing: Bridging the Gap to Evidence-Based Practice* boxes, appearing throughout the book, promote the value of research, and apply its relevance to nursing practice. Students are challenged to become informed participants in, and consumers of, clinical research. To that end, students can explore additional research in nursing journal articles provided for each chapter on our website (http://thePoint.lww.com/Taylor10e).

Focus on Nursing Skills

Skills are presented in a concise, straightforward, and simplified format that is intended to facilitate competent performance of nursing skills. A scientific rationale accompanies each nursing action; many color photographs and illustrations further reinforce mastery. Students are encouraged to think critically about the skills they are performing. *Delegation Considerations* assist students and graduate nurses in developing the critical decision-making skills necessary to transfer responsibility for the performance of an activity to another individual and to ensure safe and effective nursing care. The *Developing Clinical Reasoning and Judgment* features support development of clinical reasoning and clinical judgment skills. *Unexpected Situations and Related Interventions* are included to help students think critically about the skills they are performing. *Special Considerations*, including modifications and age and community-based care considerations, are given where appropriate and guide students to implement person-centered interventions. Also included are *Documentation Guidelines* and *Sample Documentation* to help students learn what and how to document when performing skills.

Hand Hygiene icons alert students to this crucial step that is the best way to prevent the spread of microorganisms (see the *How to Use Fundamentals of Nursing* section on pp. xvi–xxv).

Patient Identification icons alert students to this critical step ensuring the right patient receives the intervention to help prevent errors (see the *How to Use Fundamentals of Nursing* section on pp. xvi–xxv).

Focus on Community and Expanded Nursing Roles

Patients today spend fewer days in the hospital, are frequently transferred both within the hospital and between health care institutions and home, and need to rely on rapidly proliferating community-based health care resources. Content on accountable care organizations, medical homes, and medical neighborhoods, as well as content on the new roles for nurses (nurse coach, clinical nurse leader, nurse navigator, and nurse care coordinator) highlight both traditional and innovative care in institutional and community-based practice settings. New content includes the Robert Wood Johnson Foundations Healthy Communities resources and CDC's Division of Community Health (DCH), which created Partnerships to Improve Community Health (PICH).

Focus on Safety

New content highlights today's emphasis on patient safety, including expanded safety information related to children,

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

adolescents, and older adults. The National Academy of Sciences, Engineering and Medicine safety content, 2020 Joint Commission National Patient Safety Goals, and Sentinel Event Statistics are highlighted, and new information is provided on health care–associated infections (HAIs). Safe Patient Handling and Mobility Practices are included in this edition as well as expanded content on patient "hand-offs."

In addition, QSEN boxes and Safety Alerts help students cultivate the Quality and Safety Education for Nurses (QSEN) and blended competencies they will need to serve patients and the public well.

Pandemic Precautions

It is difficult to determine where we will be as the learning package publishes. We obviously strongly recommend following the CDC and your institutional guidelines on use of personal protective equipment and the guidelines to reduce transmission. That said, you will not see masks worn in most photos unless generally indicated. We are hopeful that we will all soon be practicing in a postpandemic world.

Up-to-Date Clinical and Practice Information

Revisions in each clinical chapter will help educators and students remain current. Sample new content includes:

- Updated information from AACN's *Essentials*, the ANA *Nursing: Scope and Standards of Practice* (4th ed.), and National Academy of Sciences, Engineering and Medicine's *The Future of Nursing 2020–2030*
- NEW! Content on diversity, inclusion, and equity that addresses institutional and systemic racism
- AACN's Four Spheres of Care
- Updated content on the Formation of the Professional Identity of the Nurse
- NEW! Feature: Evolving Case Study that reflects the Next Generation NCLEX (NGN)
- NEW! Information on deaths of isolation and despair
- United Nations Sustainable Development Goals
- NEW! Content on climate change and environmental health
- NEW! Content on moral agency, moral distress, moral injury, incivility, and academic ethics
- Challenging topic on reproductive ethics
- Challenging topic on nurse death by suicide
- Leadership's role in preventing clinician burnout
- Pandemic consideration throughout—as applicable
- Community Health needs assessment
- Healthy People 2030
- Updated mental health content
- Comparison of clinical judgment models
- Quick priority assessments
- NEW! Content on triage and nurse triage role
- Updated content on documentation
- New! Information on telehealth, remote monitoring, and mobile care teams
- NEW! Content on disabilities and a vulnerable populations alert
- NEW! Content on adverse childhood experiences
- NEW! Content on treatment of transgender children and gender dysphoria
- Updated content on human suffering and compassionate presence
- Meeting the spiritual needs of millennials
- Expanded information on genetics, genomics, and epigenetics
- Information on SIDS and SUID (sudden unexplained infant death)
- Expanded discussion of childhood obesity
- Dangers associated with substance use disorder and opioid use disorder
- Expanded information on multiple drug–resistant organisms; use of care bundles or evidence-based protocols; the impact of staffing issues on HAIs
- ANA recommendations on reducing use of restraints
- Periop: "never events," new guidelines for preop fasting and skin prep, and operative positioning recommendations by AORN (Association of periOperative Registered Nurses)
- The Joint Commission universal protocol and "time-out"
- Noise prevention in acute care and ICU
- Expanded content on self-care including new information on mindfulness and a new Nurse Self-Care alert
- The Joint Commission Sentinel Alert on fatigue in health care workers
- Role of Pain Resource Nurse
- New content on biological sex, biological sex identification, and sexual orientation
- SBAR/SBARR/I-SBAR-R communication to improve patient "hand-offs" from one professional caregiver to another
- CUS communication tool to assist in effective communication related to patient safety concerns
- Updated ANA Principles of Delegation
- Updated content on maintaining privacy, confidentiality, and professionalism and the use of social media

- Content on Bedside Reports and Purposeful rounding
- Updated medication math calculations designed to highlight common errors
- Enhanced content on the opioid crisis including new standards by The Joint Commission such as the Prescription Drug Monitoring Program (PDMP), individualizing and performing a comprehensive pain assessment, and current pain management guidelines
- Inclusion of new terms and treatments associated with pressure injuries and wounds
- Cardiopulmonary resuscitation (CPR) for the mind: Facts About Mental Health First Aid

Self-Assessment Guides

Fundamentals of Nursing has always encouraged students to be independent learners. Checklists throughout the text (e.g., blended skills assessment, use of nursing process, health assessments) allow students to evaluate their personal strengths and limitations and develop related learning goals.

SPECIAL FEATURES

Many features appear throughout the text to help students grasp important content. Refer to the "How to Use *Fundamentals of Nursing*" section on pages xiii–xxii to learn more about them.

COMPREHENSIVE, INTEGRATED FUNDAMENTALS AND SKILLS SOLUTIONS

We are delighted to offer an expanded suite of digital solutions that offer instructors and students using the Taylor, Lynn, and Bartlett Fundamentals and Skills suite of content everything they need to conduct their fundamentals course and integrate clinical skills learning throughout the curriculum. To learn more about any solution with the Taylor suite, please contact your local Wolters Kluwer representative.

Lippincott CoursePoint+

Lippincott® CoursePoint+ is an integrated, digital curriculum solution for nursing education that provides a completely interactive experience geared to help students understand, retain, and apply their course knowledge and be prepared for practice. The time-tested, easy-to-use, and trusted solution includes engaging learning tools, evidence-based practice, case studies, and in-depth reporting to meet students where they are in their learning, combined with the most trusted nursing education content on the market to help prepare students for practice. This easy-to-use digital learning solution of *Lippincott® CoursePoint+*, combined with unmatched support, gives instructors and students everything they need for course and curriculum success!

Lippincott® CoursePoint+ includes:

- An interactive eBook provides on-demand access to the full contents of this textbook.
- Leading content provides a variety of learning tools to engage students of all learning styles.
- A personalized learning approach gives students the content and tools they need at the moment they need it, giving them data for more focused remediation and helping to boost their confidence and competence.
- Powerful tools, including varying levels of case studies, interactive learning activities, and adaptive learning powered by PrepU, help students learn the critical thinking and clinical judgment skills to help them become practice-ready nurses.
- Preparation for Practice tools improve student competence, confidence, and success in transitioning to practice.
- **vSim for Nursing:** Help students be practice-ready with the next generation of vSim for Nursing. The virtual simulation program that so many nursing educators and students rely on has been taken to the next level, providing the most realistic, true-to-life clinical experience. Co-developed by Laerdal Medical and Wolters Kluwer, vSim® for Nursing | Fundamentals provides real-world, evidence-based scenarios written by the National League for Nursing, with built-in point-of-care solutions for reference and remediation. With vSim for Nursing, students can develop their clinical judgment, competence, and confidence. The next generation of vSim for Nursing offers increased realism and fidelity, improved communication, and enhanced opportunities to develop clinical judgment.
- **Lippincott Advisor for Education:** With over 8,500 entries covering the latest evidence-based content and drug information, Lippincott Advisor for Education provides students with the most up-to-date information possible, while giving them valuable experience with the same point-of-care content they will encounter in practice.
- Unparalleled reporting provides in-depth dashboards with several data points to track student progress and help identify strengths and weaknesses.
- Unmatched support includes training coaches, product trainers, and nursing education consultants to help educators and students implement CoursePoint+ with ease.

Lippincott Skills for Nursing Education

Developed with complete consistency with *Fundamentals of Nursing*, the companion skills title, *Taylor's Clinical Skills for Nursing Education*, 6th Edition, by Pamela Lynn is now available in a new digital solution.

Help student nurses develop skill competency and clinical judgment with ***Lippincott® Skills for Nursing Education***,

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

an unparalleled nursing education skills solution.

Available anytime, anywhere, ***Lippincott Skills for Nursing Education*** is designed specifically to empower nursing faculty and students to support teaching, learning, and reporting on nursing skills across the curriculum. Expert-authored skill instructions, evidence-based rationales, numerous videos, and case studies help the novice nursing student master new skills and confidently prepare for skills lab and clinical settings.

Used alone or integrated with *Lippincott® CoursePoint*, ***Lippincott Skills for Nursing Education*** offers an efficient learning experience backed with tools to monitor and motivate student preparedness and skill competency.

Taylor's Clinical Nursing Skills Collection, authored by Pamela Lynn, EdD, MSN, RN, delivers a robust set of essential skills for the undergraduate nurse and meets the needs of students throughout the curriculum.

ADDITIONAL RESOURCES FOR TEACHING AND LEARNING

To further facilitate teaching and learning, a carefully designed teaching and learning package has been developed to assist faculty and students.

Instructor Resources

Tools to assist you with teaching your course are available in Lippincott CoursePoint+, with select tools available upon adoption of this text on thePoint® at http://thepoint.lww.com/Taylor10e.

- A thoroughly revised and augmented **Test Generator** contains more than 2900 NCLEX-style questions mapped to chapter learning outcomes.
- An extensive collection of materials is provided for each book chapter:
  - **Lesson Plans** outline learning outcomes and identify relevant resources from the robust instructor and student resource packages to help you prepare for your class.
  - **Pre-Lecture Quizzes** (and answers) allow you to check students' reading.
  - **PowerPoint Presentations** provide an easy way to integrate the textbook with your students' classroom experience; multiple-choice and true/false questions are included to promote class participation.
  - **Guided Lecture Notes** are organized by outcome and provide corresponding PowerPoint slide numbers to simplify preparation for lecture.
  - **Discussion Topics** (and suggested answers) can be used in the classroom or in online discussion boards to facilitate interaction with your students.
  - **Assignments** (and suggested answers) include group, written, clinical, and Web assignments to engage students in varied activities and assess their learning.
  - **Case Studies** with related questions (and suggested answers) give students an opportunity to apply their knowledge to a client case similar to one they might encounter in practice.
- Sample **Syllabi** are provided for one- and two-semester courses.
- **NEW! AACN Essentials Content Mapping**, which are competency-based and include expected competencies for entry-level nurses and advanced-level nurses.
- A **QSEN Competency Map** identifies content and special features in the book related to competencies identified by the QSEN Institute.
- An **Image Bank** lets you use the photographs and illustrations from this textbook in your course materials.
- Access to all **Student Resources** is provided so that you can understand the student experience and use these resources in your course as well.

Student Resources

An exciting set of learning resources is available to students using Lippincott CoursePoint+. Select resources are available on thePoint® at http://thepoint.lww.com/Taylor10e using the codes printed in the front of students' textbooks.

- Interactive learning resources appeal to a variety of learning styles.
  - **Concepts in Action Animations** bring physiologic and pathophysiologic concepts to life.
  - **Practice & Learn Case Studies** present case scenarios and offer interactive exercises and questions to help students apply what they have learned.
  - **Watch & Learn Videos** reinforce select skills from the textbook and appeal to visual and auditory learners.
- **Journal Articles** offer access to current articles relevant to each chapter and available in Wolters Kluwer journals to familiarize students with nursing literature.

Study Guide

A comprehensive study aid for reviewing key concepts, *Study Guide for Fundamentals of Nursing: The Art and Science of Person-Centered Care*, 10th Edition, has been thoroughly revised and presents a variety of exercises, including case studies and practice NCLEX-style questions, to reinforce textbook content and enhance learning.

Skill Checklists

Skill Checklists for Fundamentals of Nursing: The Art and Science of Person-Centered Care, 10th Edition (included in

Lippincott CoursePoint+ or available in print) offers step-by-step forms to evaluate student competency for the skills included in this textbook. A more complete list of skills and associated skill checklists is available in *Lippincott Skills for Nursing Education*.

Lippincott DocuCare

Available for separate purchase, Lippincott® DocuCare combines Web-based academic EHR simulation software with clinical case scenarios, allowing students to learn how to use an EHR in a safe, true-to-life setting, while enabling instructors to measure their progress. Lippincott DocuCare's nonlinear solution works well in the classroom, simulation lab, and clinical practice.

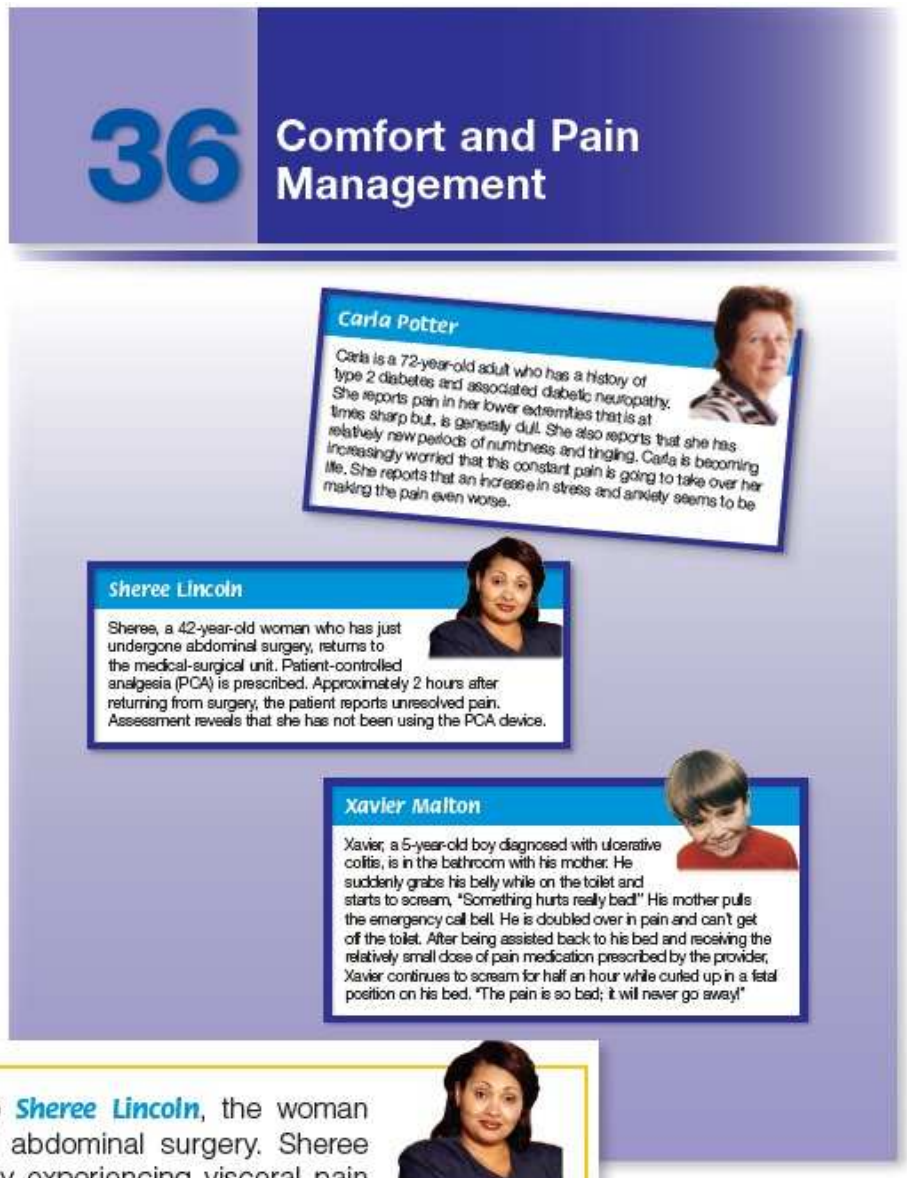
HOW TO USE

Fundamentals of Nursing

Dear Student,



Congratulations on choosing an exciting and rewarding profession! All of us who have been part of the writing of this text welcome you warmly to our profession and value our role as your guides to excellent practice. We have tried in this text to present in a readable and enjoyable format, the scientific and technical knowledge you will need to design safe and effective nursing care. But we want to do more than prepare you intellectually and technically. You will also find narratives that will teach you valuable interpersonal skills and content specifically designed to prepare you to meet the ethical and legal challenges in today's practice. So take a deep breath and dig in. Your patients are counting on you and so are we!

Carol Taylor, Pamela Lynn, and Jennifer L. Bartlett

HERE'S HOW TO GET STARTED!

FOLLOW THE STORY LINES!

Get to know your patients by reading the chapter opening **Case Scenarios**.

Narratives throughout the chapter refer to these scenarios, helping you to consider how the chapter content applies to care of real patients. For your convenience, a list of these case scenarios and threaded narratives, along with their location in the book, appears in the "Case Studies in This Book" section later in this front matter.

FOLLOW THE STORY LINES!

Get to know your patients by reading the chapter opening **Case Scenarios**.

Narratives throughout the chapter refer to these scenarios, helping you to consider how the chapter content applies to care of real patients. For your convenience, a list of these case scenarios and threaded narratives, along with their location in the book, appears in the "Case Studies in This Book" section later in this front matter.

NEWLY UPDATED! Unfolding Patient Stories, written by the National League for Nursing, are an engaging way to begin meaningful conversations in the classroom. These vignettes, which unfold in two parts each and are interspersed throughout the text, feature patients from Wolters Kluwer's *vSim Fundamentals* (codeveloped by Laerdal Medical) and DocuCare products; however, each Unfolding Patient Story in the book stands alone, not requiring purchase of these products. For your convenience, a list of these case studies, along with their location in the book, appears in the "Case Studies in This Book" section later in this front matter.

Unfolding Patient Stories: Marvin Hayes • Part 1

Marvin Hayes, a 43-year-old male, is being seen at the clinic. He has a family history of colorectal cancer. What questions can the nurse ask to identify disturbances in bowel elimination? What are the signs and symptoms of colon and rectal cancer? What patient education would the nurse provide when orders are written to obtain a stool sample and schedule a colonoscopy? (Marvin Hayes' story continues in Chapter 42.)

Care for Marvin and other patients in a realistic virtual environment: ***vSim*** *for Nursing* (thepoint.lww.com/vSimFunds). Practice documenting these patients' care in DocuCare (thepoint.lww.com/DocuCareEHR).

GET READY TO LEARN!

Before reading the chapter content, read the **Learning Outcomes**. These roadmaps help you understand what is important and why. Create your own learning outline or use them for self-testing.

Learning Outcomes

After completing the chapter, you will be able to accomplish the following:

1. Explain the components, purposes, and types of health assessments.
2. Prepare the patient and the environment for a health assessment.
3. Conduct a health history.
4. Use the techniques of inspection, palpation, and auscultation appropriately during a physical assessment.
5. Conduct a physical assessment in a systematic manner.
6. Document health assessment findings in a concise, descriptive, and legally appropriate manner.
7. Describe nursing responsibilities related to diagnostic and laboratory testing as part of health assessment.

NEW! Nursing Concepts list in the chapter opener highlight connections to nursing concepts for ease of identification.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Nursing Concepts

- Assessment
- Clinical Decision Making/Clinical Judgment
- Communication
- Therapeutic Communication

Key Terms are bolded throughout the narrative; explanations to help you become familiar with new vocabulary are presented online at https://thepoint.lww.com/taylor10e

STAY CURRENT ON SAFETY, TECHNOLOGY, AND LEGAL DEVELOPMENTS!

QSEN boxes highlight content related to QSEN competencies, which are key to ensuring students understand how to avoid harming patients and providers with best practice in individual performance and facility wide.

QSEN PATIENT-CENTERED CARE

The health practices and beliefs of patients and/or family members/caregivers related to fever and other symptoms may be influenced by cultural beliefs and practices. Culturally and ethnically sensitive strategies must be considered when providing interventions and patient education related to fever.

Technology Alerts feature new technology in development that will likely be in place by the time students are practicing. By understanding as students that technology is always changing, they will be better prepared to embrace change later.

Technology Alert

One system, ON-Q Pain Relief System, involves administration of local anesthetic medication directly at the affected surgical site. The benefit of this temporary system is earlier mobility and effective pain relief, with fewer side effects because of decreased opioid use postoperatively (Cinar et al., 2021; Porter et al., 2021).

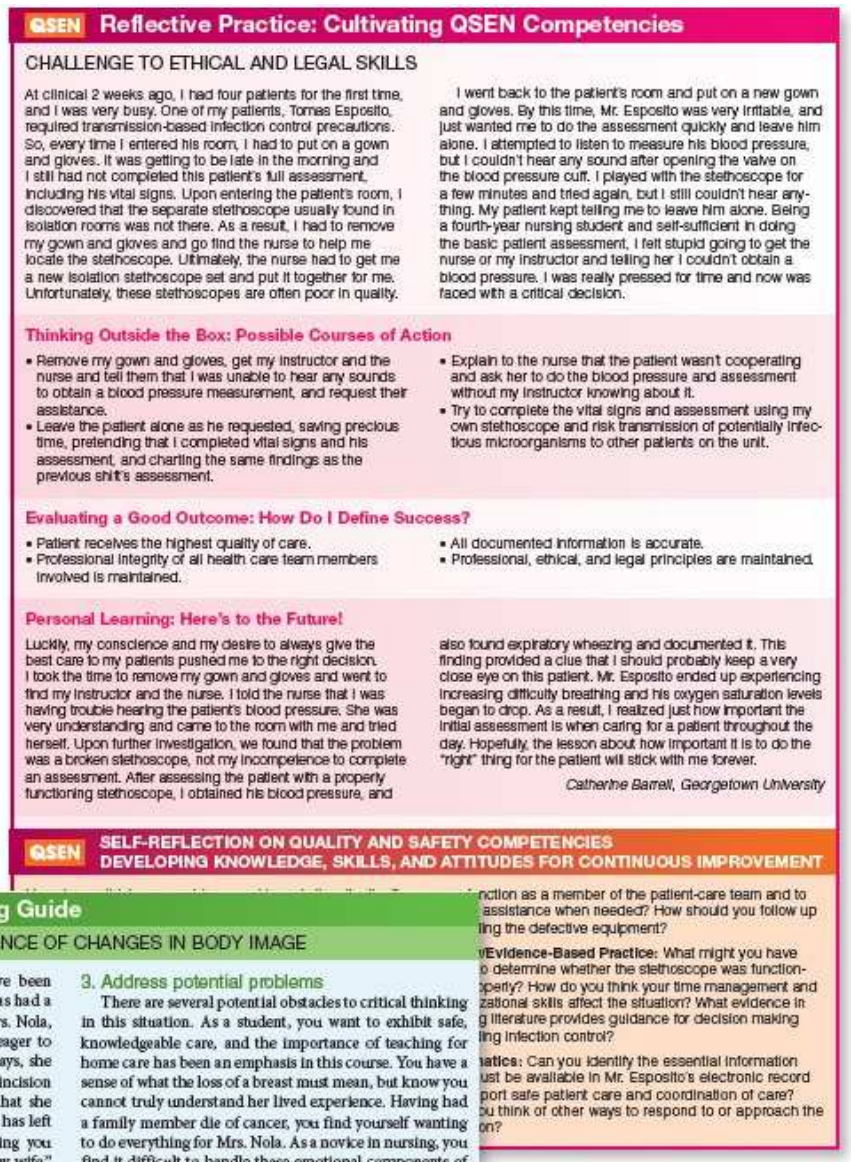
Legal Alerts highlight important laws that affect nurses and are applicable to nursing practice.

Legal Alert

Patients have the right to be treated with dignity and to be involved in developing their pain management plan of care.

LEARN TO PRACTICE WELLNESS STRATEGIES AND SELF-CARE!

NEW! Nursing Self-Care Alerts remind us that we cannot be there for others if we do not take care of ourselves.



Nursing Self-Care Alert

Although the benefits of wearing a mask far outweighed the potential risks, nurses (and other members of the interprofessional health care team) had to take extra measures during the pandemic to protect their skin from breakdown due to prolonged use of masks and other necessary PPE.

DEVELOP CRITICAL THINKING, CLINICAL REASONING, AND CLINICAL JUDGMENT SKILLS!

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Read **Reflective Practice** boxes and discover how other nursing students confront challenging situations (cognitive, technical, interpersonal, or ethical/legal). What course of action did the student take? Would you do the same? Reflect on how you would respond to similar situations while developing QSEN competencies.

QSEN Reflective Practice: Cultivating QSEN Competencies

CHALLENGE TO ETHICAL AND LEGAL SKILLS

At clinical 2 weeks ago, I had four patients for the first time, and I was very busy. One of my patients, Tomas Esposito, required transmission-based infection control precautions. So, every time I entered his room, I had to put on a gown and gloves. It was getting to be late in the morning and I still had not completed this patient's full assessment, including his vital signs. Upon entering the patient's room, I discovered that the separate stethoscope usually found in isolation rooms was not there. As a result, I had to remove my gown and gloves and go find the nurse to help me locate the stethoscope. Ultimately, the nurse had to get me a new isolation stethoscope set and put it together for me. Unfortunately, these stethoscopes are often poor in quality.

I went back to the patient's room and put on a new gown and gloves. By this time, Mr. Esposito was very irritable, and just wanted me to do the assessment quickly and leave him alone. I attempted to listen to measure his blood pressure, but I couldn't hear any sound after opening the valve on the blood pressure cuff. I played with the stethoscope for a few minutes and tried again, but I still couldn't hear anything. My patient kept telling me to leave him alone. Being a fourth-year nursing student and self-sufficient in doing the basic patient assessment, I felt stupid going to get the nurse or my instructor and telling her I couldn't obtain a blood pressure. I was really pressed for time and now was faced with a critical decision.

Thinking Outside the Box: Possible Courses of Action

- Remove my gown and gloves, get my instructor and the nurse and tell them that I was unable to hear any sounds to obtain a blood pressure measurement, and request their assistance.
- Leave the patient alone as he requested, saving precious time, pretending that I completed vital signs and his assessment, and charting the same findings as the previous shift's assessment.
- Explain to the nurse that the patient wasn't cooperating and ask her to do the blood pressure and assessment without my instructor knowing about it.
- Try to complete the vital signs and assessment using my own stethoscope and risk transmission of potentially infectious microorganisms to other patients on the unit.

Evaluating a Good Outcome: How Do I Define Success?

- Patient receives the highest quality of care.
- Professional integrity of all health care team members involved is maintained.
- All documented information is accurate.
- Professional, ethical, and legal principles are maintained.

Personal Learning: Here's to the Future!

Luckily, my conscience and my desire to always give the best care to my patients pushed me to the right decision. I took the time to remove my gown and gloves and went to find my instructor and the nurse. I told the nurse that I was having trouble hearing the patient's blood pressure. She was very understanding and came to the room with me and tried herself. Upon further investigation, we found that the problem was a broken stethoscope, not my incompetence to complete an assessment. After assessing the patient with a properly functioning stethoscope, I obtained his blood pressure, and also found expiratory wheezing and documented it. This finding provided a clue that I should probably keep a very close eye on this patient. Mr. Esposito ended up experiencing increasing difficulty breathing and his oxygen saturation levels began to drop. As a result, I realized just how important the initial assessment is when caring for a patient throughout the day. Hopefully, the lesson about how important it is to do the "right" thing for the patient will stick with me forever.

Catherine Barrell, Georgetown University

QSEN SELF-REFLECTION ON QUALITY AND SAFETY COMPETENCIES DEVELOPING KNOWLEDGE, SKILLS, AND ATTITUDES FOR CONTINUOUS IMPROVEMENT

…nction as a member of the patient-care team and to … assistance when needed? How should you follow up …ing the defective equipment?

…**Evidence-Based Practice:** What might you have …o determine whether the stethoscope was function-…perly? How do you think your time management and …zational skills affect the situation? What evidence in …g literature provides guidance for decision making …ing infection control?

…**natics:** Can you identify the essential information …ust be available in Mr. Esposito's electronic record …port safe patient care and coordination of care? …u think of other ways to respond to or approach the …on?

Learn how careful thinking can change patient outcomes. Like nursing care, careful thinking and reflective practice follow a process. Study the **Focused Critical Thinking Guides** to gain skill in working through the step-by-step critical thinking process.

33-1 Focused Critical Thinking Guide

WOUND CARE: PROMOTING ACCEPTANCE OF CHANGES IN BODY IMAGE

During both clinical days in 1 week, you have been assigned to care for a middle-aged woman who has had a breast removed because of cancer. The patient, Mrs. Nola, is an attractive, usually cheerful woman who is eager to get better and return home. However, on both days, she turned her head away and would not look at the incision when her dressing was changed. She tells you that she "just can't stand to look at herself." Her husband has left the room during the dressing changes after telling you that "it makes me sick to see what happened to my wife." Mrs. Nola is to be discharged to her home the next day and needs to learn how to provide self-care for her wound. What do you do?

1. Identify goal of thinking

Determine the most effective way of ensuring wound care while also assisting Mrs. Nola in accepting her altered self-image.

2. Assess adequacy of knowledge

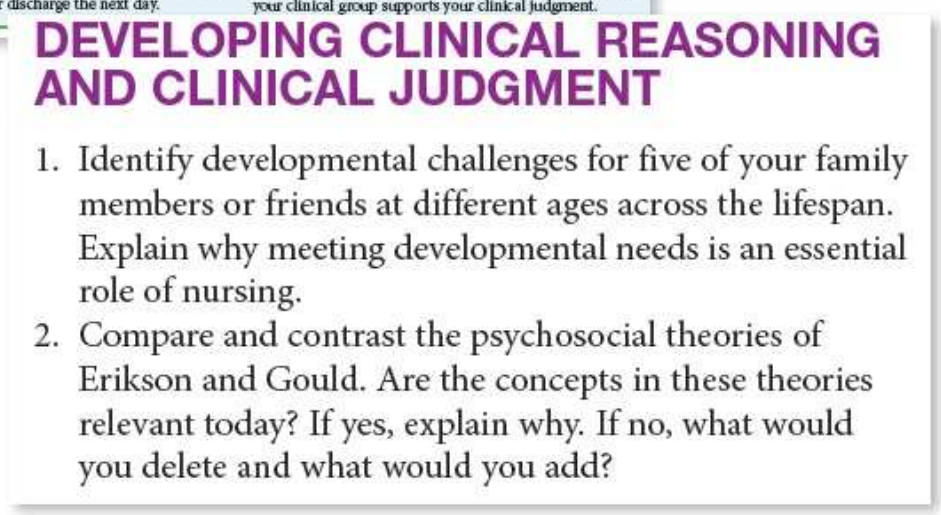
Pertinent circumstances: The diagnosis of cancer was made only 2 weeks before the surgical removal of the breast. The patient is to be discharged to her home the next day. The wound from her mastectomy has not completely healed and will require dressing changes for another 3 or 4 days. Mrs. Nola has had a disfiguring surgery and is coping with not only a change in body image, but also the diagnosis of cancer. She has never been seriously ill or had surgery. She has a strong, loving relationship with her husband, but he is unable to deal with the physical disfigurement at this time.

Prerequisite knowledge: Before you decide what to do in this situation, you need to know how Mrs. Nola is coping with her diagnosis of cancer. If she is still in denial about the disease, it is likely that she is also denying the surgical procedure and the changes in her body. You will need to review responses to the diagnosis of cancer as well as the stages of grief and loss. You will have to learn what her sources of support are and how she can best access and use them. You will need to assess how best to help her achieve wound care in the face of her continued refusal even to look at the wound.

Room for error: If she is forced to look at the wound or made to feel inadequate because of her inability to do so, she may feel threatened and may become angry in response to the perceived threat and retreat even further.

Time constraints: Some decision about wound care must be made before her discharge the next day.

3. Address potential problems



There are several potential obstacles to critical thinking in this situation. As a student, you want to exhibit safe, knowledgeable care, and the importance of teaching for home care has been an emphasis in this course. You have a sense of what the loss of a breast must mean, but know you cannot truly understand her lived experience. Having had a family member die of cancer, you find yourself wanting to do everything for Mrs. Nola. As a novice in nursing, you find it difficult to handle these emotional components of patient care and find yourself wanting to focus objectively on the task at hand and scold both the patient and her husband for being so silly about something as simple as a dressing change.

4. Consult helpful resources

You must first appreciate the loss and grief Mrs. Nola is experiencing, and you must then relate that to her response to self-care of the wound. Your best source of information about her coping methods and sources of personal strength is Mrs. Nola herself. You also discuss the most effective way of providing wound care at home with your instructor and the case manager for Mrs. Nola.

5. Critique judgment/decision

After talking to Mrs. Nola, your instructor, and the case manager, you mutually agree that Mrs. Nola cannot be hurried into acceptance of her medical diagnosis or her body changes. The case manager consults with Mrs. Nola's provider, who writes a prescription for a home health care nurse to visit for the next 4 days and complete the dressing change. After talking with Mrs. Nola, you identify that she is still very much in denial. You discuss with her the possibility of having a visitor from "Reach to Recovery," a support group for women with breast cancer who have had a mastectomy. Mrs. Nola tells you that she thinks she would like to talk to someone with the same diagnosis, and you call a referral for her. When you tell Mrs. Nola that a home health care nurse will be visiting her for the first few days at home to change her dressing and ensure Mrs. Nola can appropriately change the dressing herself, tears fill her eyes. She says, "I am so scared—I just don't know what to do." You realize that insisting that Mrs. Nola do her own dressing (in this moment) would have been extremely stressful for her. Focusing solely on the task would have been perceived as dismissive and could have negatively impacted on the trusting relationship you were trying to form with the patient. When you share the situation in postconference, your clinical group supports your clinical judgment.

DEVELOPING CLINICAL REASONING AND CLINICAL JUDGMENT

1. Identify developmental challenges for five of your family members or friends at different ages across the lifespan. Explain why meeting developmental needs is an essential role of nursing.
2. Compare and contrast the psychosocial theories of Erikson and Gould. Are the concepts in these theories relevant today? If yes, explain why. If no, what would you delete and what would you add?

Challenge yourself! Use the new knowledge you've gained to "think through" learning exercises in the **Developing Clinical Reasoning and Clinical Judgment** section at the end of each chapter.

NEW! Work through the **Evolving Case Studies** to help develop and refine your clinical reasoning and clinical judgment skills.

EVOLVING CASE STUDY 33-1

Scenario: Sam Bentz, a 56-year-old admitted to the hospital for management of nonhealing wounds and an infection mentions, "Last time I was here, my skin got really irritated and I developed several skin wounds."

QUESTION r/t CUES: Based on the patient's reason for admission, what initial question is the most important for the nurse to ask?

A. "Can you tell me about your wounds and what prompted you to come to the hospital?"
B. "Can you tell me why you were here for your last admission?"
C. "Is this admission due to your lack of follow-through after your last discharge?"
D. "Can you define irritated for me? Was this your interpretation or your provider's?"

Scenario: You note that Sam is 5 ft 4 in tall and weighs more than 300 lb with a BMI of >51.5, which means Sam

Scenario: The nurse sits down next to Sam, reframes, and asks the question again. Sam apologizes for reacting and admits that they felt "judged and fat-shamed" their last admission. Sam relaxes and begins describing their nonhealing wounds. Seizing the opportunity, the nurse performs an assessment and finds Sam's legs to be edematous, red, and macerated; weeping serous fluid; rough; and painful to the touch. There are also three large, round, deep, yellow, necrotic nonhealing wounds on the left lower leg near the ankle. When the nurse turns Sam to the side, the nurse notes a large, foul-smelling sacral wound that is covered with what appears to be an old duoderm dressing.

QUESTION r/t PRIORITIZING HYPOTHESIS: Based on the objective and subjective assessment of this patient, which priority problem should the nurse identify to guide the plan of care?

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

MAKE REFLECTIVE PRACTICE AN ESSENTIAL PART OF YOUR PROFESSIONAL PRACTICE!

Reflective Practice Leading to Personal Learning sections conclude most chapters. **Reflective practice** is a purposeful activity that leads to action, improvement of practice, and better patient outcomes. It is about looking at an event, understanding it, and learning from it. Learning from reflection is not automatic; it requires a deeper understanding of how and why reflection contributes to the competence of the effective nurse. Start your practice by concluding each caregiving experience with a moment of reflection that identifies and celebrates the nursing skills used and targets skills that still need to be developed. This practice can keep you from feeling overwhelmed by everything that remains to be mastered and yet strongly motivated to learn new skills.

REFLECTIVE PRACTICE LEADING TO PERSONAL LEARNING

Remember that the goal of reflective practice is to look at an experience, understand it, and learn from it. As you begin to develop expertise in implementing measures related to complementary and integrative health practices, reflect on your experiences—successes and failures—in order to improve your practice. How can you do it better next time? What did you learn today that can help you tomorrow? Begin your reflection by paying close attention to the following while performing interventions related to CHAs and integrative health care and providing nursing care:

- Were you aware of any cultural and/or ethnic beliefs or practices that may have influenced the health practices and beliefs of patients and/or family members/caregivers related to CHA/IH? Were you aware of any stereotypes or prejudices that might have negatively influenced the clinical encounter? If so, how did you address these?
- Was the patient/family/caregiver participation in the

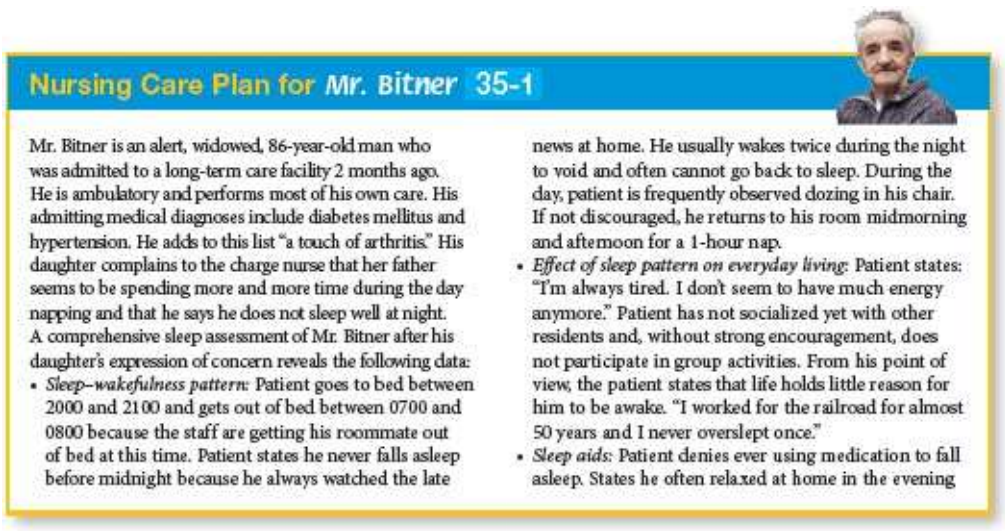
NURSING PROCESS FOR COMFORT AND PAIN MANAGEMENT

Assessing

Because the pain experience is unique to each person, the nurse who wants to help the patient achieve comfort and pain control needs sophisticated pain assessment skills. Assessing all factors that affect the pain experience—psychological, sociocultural, spiritual, and physiologic—is essential. Pain is complex and difficult to interpret and requires a reliable assessment tool.

Routine Pain Assessment



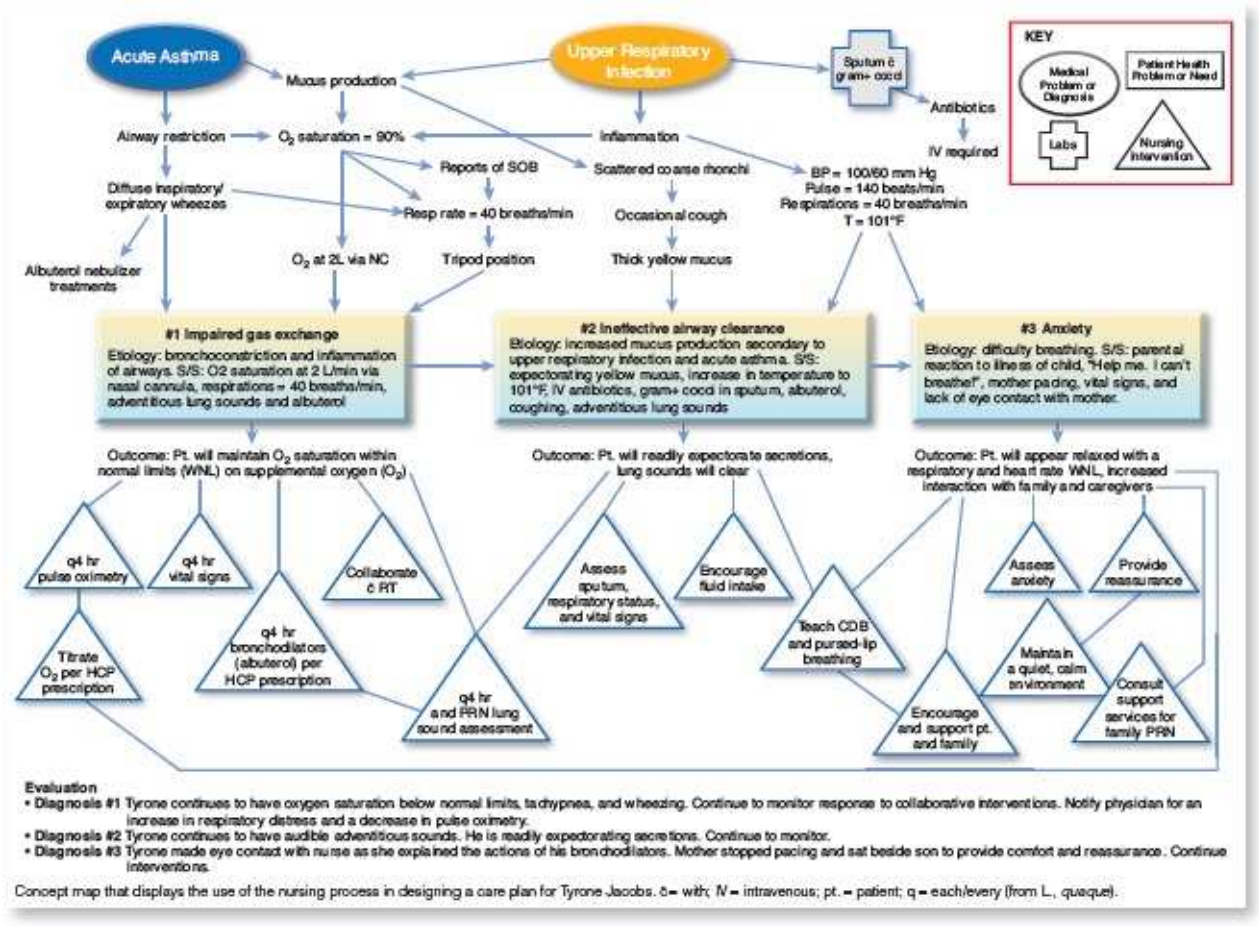
In an effort to improve patients' quality of life and make pain management a priority, the American Pain Society (1995) encouraged caregivers to include assessment for pain as the fifth vital sign. Routine measurement of vital signs accompanied by a pain assessment was thought to raise awareness of the existence of pain, place additional emphasis on optimizing pain relief, and move patients more quickly toward comfort and recovery. However, this framing led to the problematic interpretation that pain needed to be

MASTER NURSING PROCESS!

Throughout the clinical chapters, you will find many ways to help you visualize and understand the nursing process.

Follow the step-by-step organization of the **Nursing Process** section to understand nursing responsibilities.

Examine the **Nursing Care Plan** box (often derived from the chapter opener cases) to discover common health problems and the wide variety of independent and collaborative interventions that nurses manage.



Nursing Care Plan for Mr. Bitner 35-1

Mr. Bitner is an alert, widowed, 86-year-old man who was admitted to a long-term care facility 2 months ago. He is ambulatory and performs most of his own care. His admitting medical diagnoses include diabetes mellitus and hypertension. He adds to this list "a touch of arthritis." His daughter complains to the charge nurse that her father seems to be spending more and more time during the day napping and that he says he does not sleep well at night. A comprehensive sleep assessment of Mr. Bitner after his daughter's expression of concern reveals the following data:

- *Sleep–wakefulness pattern:* Patient goes to bed between 2000 and 2100 and gets out of bed between 0700 and 0800 because the staff are getting his roommate out of bed at this time. Patient states he never falls asleep before midnight because he always watched the late news at home. He usually wakes twice during the night to void and often cannot go back to sleep. During the day, patient is frequently observed dozing in his chair. If not discouraged, he returns to his room midmorning and afternoon for a 1-hour nap.
- *Effect of sleep pattern on everyday living:* Patient states: "I'm always tired. I don't seem to have much energy anymore." Patient has not socialized yet with other residents and, without strong encouragement, does not participate in group activities. From his point of view, the patient states that life holds little reason for him to be awake. "I worked for the railroad for almost 50 years and I never overslept once."
- *Sleep aids:* Patient denies ever using medication to fall asleep. States he often relaxed at home in the evening

View the **Concept Map** (from selected chapter opener cases) to see how the nursing process can be visually represented when planning care for a patient.

Concept map that displays the use of the nursing process in designing a care plan for Tyrone Jacobs. ć = with; IV = intravenous; pt. = patient; q = each/every (from L., *quaque*).

Then use these tools to further develop your nursing process skills:

Focused Assessment Guides with sample interview questions will help strengthen your assessment skills.

Focused Assessment Guide 27-1

HEALTH HISTORY

Factors to Assess	Questions and Approaches
Present health history	"When did you first begin having this problem?" "Did it happen suddenly or slowly?" "Show me exactly where you are having this problem." "What other symptoms have you had with this problem?" "How have you treated this problem?"
Past health history	"Tell me about the childhood illnesses, such as measles or mumps, that you had." "What are you allergic to?" "Describe any accidents, injuries, and surgeries you have had." "What prescribed or over-the-counter medications do you use?" "Do you take any herbal or dietary supplements?" "What is the date of your most recent immunization for tetanus; pertussis; polio; measles; rubella; mumps; influenza; hepatitis A, B, and C; and pneumococcus?"

Examples of Actual and Potential Patient Problems and Needs teach you how to identify and formulate patient

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

problems, and identify needs based on etiologic factors and assessment data.

Examples of Actual or Potential Health Problems and Needs

FLUID, ELECTROLYTE, AND ACID–BASE BALANCE

Actual or Potential Health Problems and Needs	Possible Etiologic Factors	Potential Signs and Symptoms
Fluid overload	Renal failure, decreased cardiac output, excessive IV infusion/ fluid intake, excessive sodium intake	• "I've noticed that my wedding ring is tight . . . also my clothes don't fit as well as they used to. I guess I've gained some weight." • Reports dyspnea with exertion, feeling weak and fatigued • Pitting edema in feet, ankles, lower legs, taut, shiny skin • Adventitious breath sounds and increased blood pressure • 10-lb (4.5-kg) weight gain over past month
Fluid imbalance	Inability to obtain or swallow	• Change in mental status

DEVELOP THE NECESSARY SKILLS!

Carefully follow the concise, straightforward, and simplified format of the nursing **Skills** that show both actions and rationales. Special considerations, delegation considerations, and documentation guidelines and samples are also included.

Hand Hygiene icons in Skills and Guidelines for Nursing Care alert students to this crucial step that is the best way to prevent the spread of microorganisms. The term *hand hygiene* applies to both the use of antiseptic handrubs and hand washing with soap and water and should be utilized according to the CDC (2002) guidelines for hand hygiene in health care settings.

Patient Identification icons in Skills and Guidelines for Nursing Care alert students to this critical step ensuring the right patient receives the intervention to help prevent errors. According to The Joint Commission (2022), the patient should be identified using at least two methods.

Nursing Alerts in Skills and Guidelines for Nursing presented in red text draw attention to crucial information in the steps of the skills.

Guidelines for Nursing Care outline important points to remember in practice and will help you gain competence in performing nursing skills.

Skill 28-2 Applying an Extremity Restraint

DELEGATION CONSIDERATIONS

After assessment of the patient by the RN, the application of an extremity restraint may be delegated to assistive personnel (AP) as well as to licensed practical/vocational nurses (LPN/LVNs). The decision to delegate must be based on careful analysis of the patient's needs and circumstances as well as the qualifications of the person to whom the task is being delegated. Refer to the Delegation Guidelines in Appendix A.

EQUIPMENT

- Appropriate cloth restraint for the extremity that is to be immobilized
- Padding, if necessary, for bony prominences
- PPE, as indicated

IMPLEMENTATION

ACTION	RATIONALE
1. Determine the need for restraints. Assess the patient's physical condition, behavior, and mental status.	Restraints should be used only as a last resort when alternative measures have failed, and the patient is at increased risk for harming self or others.
2. Confirm facility policy for the application of restraints. Secure an order from the physician or other licensed practitioner who is permitted to order restraint or seclusion in that health care facility, or validate that the order has been obtained within the required time frame (CMS, 2020).	Policy protects the patient and the nurse and specifies guidelines for application as well as the type of restraint and duration. Each order for restraint or seclusion used for the management of violent or self-destructive behavior that jeopardizes the immediate physical safety of the patient, a staff member, or others may only be renewed in accordance with the following limits for up to a total of 24 hours: (A) 4 hours for adults 18 years of age or older, (B) 2 hours for children and adolescents 9 to 17 years of age, or (C) 1 hour for children under 9 years of age. After 24 hours, before writing a new order for the use of restraint or seclusion for the management of violent or self-destructive behavior, a physician or other licensed practitioner who is permitted to order restraint or seclusion in that health care facility and responsible for the care of the patient must see and assess the patient (CMS, 2006).
3. Perform hand hygiene and put on PPE, if indicated.	Hand hygiene and PPE prevent the spread of microorganisms. PPE is required based on transmission precautions.
4. Identify the patient.	Identifying the patient ensures the right patient receives the intervention and helps prevent errors.
5. Explain the reason for restraint use to patient and family/caregivers. Clarify how care will be given and how needs will be met. Explain that restraint is a temporary measure.	Explanation to the patient and family/caregivers may lessen confusion and anger and provide reassurance. A clearly stated facility policy on the application of restraints should be available for the patient and family/caregivers to read. In a long-term care facility, the family/caregivers must give consent before a restraint is applied.
6. Include the patient's family and/or caregivers in the plan of care.	Promotes person-centered, individualized care and engagement, continuity of care and understanding.
7. Inspect the restraint before use. Do not use a restraint that is soiled or damaged (TIDI Products, 2018a).	Always inspect the device before each use, checking for broken stitches or parts, torn, cut or frayed material; or locks, buckles or hook-and-loop fasteners that do not hold securely. Do not use soiled or damaged restraints to prevent injury or death (TIDI Products, 2018a).

Guidelines for Nursing Care 27-2

MEASURING PUPILLARY REACTION, SIZE, ACCOMMODATION, AND CONVERGENCE

Pupillary Reaction

- Darken the room.
- Ask the patient to look straight ahead.
- Bring the penlight from the side of the patient's face and briefly shine the light on the pupil (Figure A).
- Observe the pupil's reaction; it normally rapidly constricts (direct response). Also observe pupil size (Figure B).
- Repeat the procedure and observe the other eye; it too normally will constrict (consensual reflex).
- Repeat the procedure with the other eye.

FIGURE A. Assessing pupillary re

Accommodation

- Hold the forefinger, a pencil, or

IN PATIENTS WITH PAIN

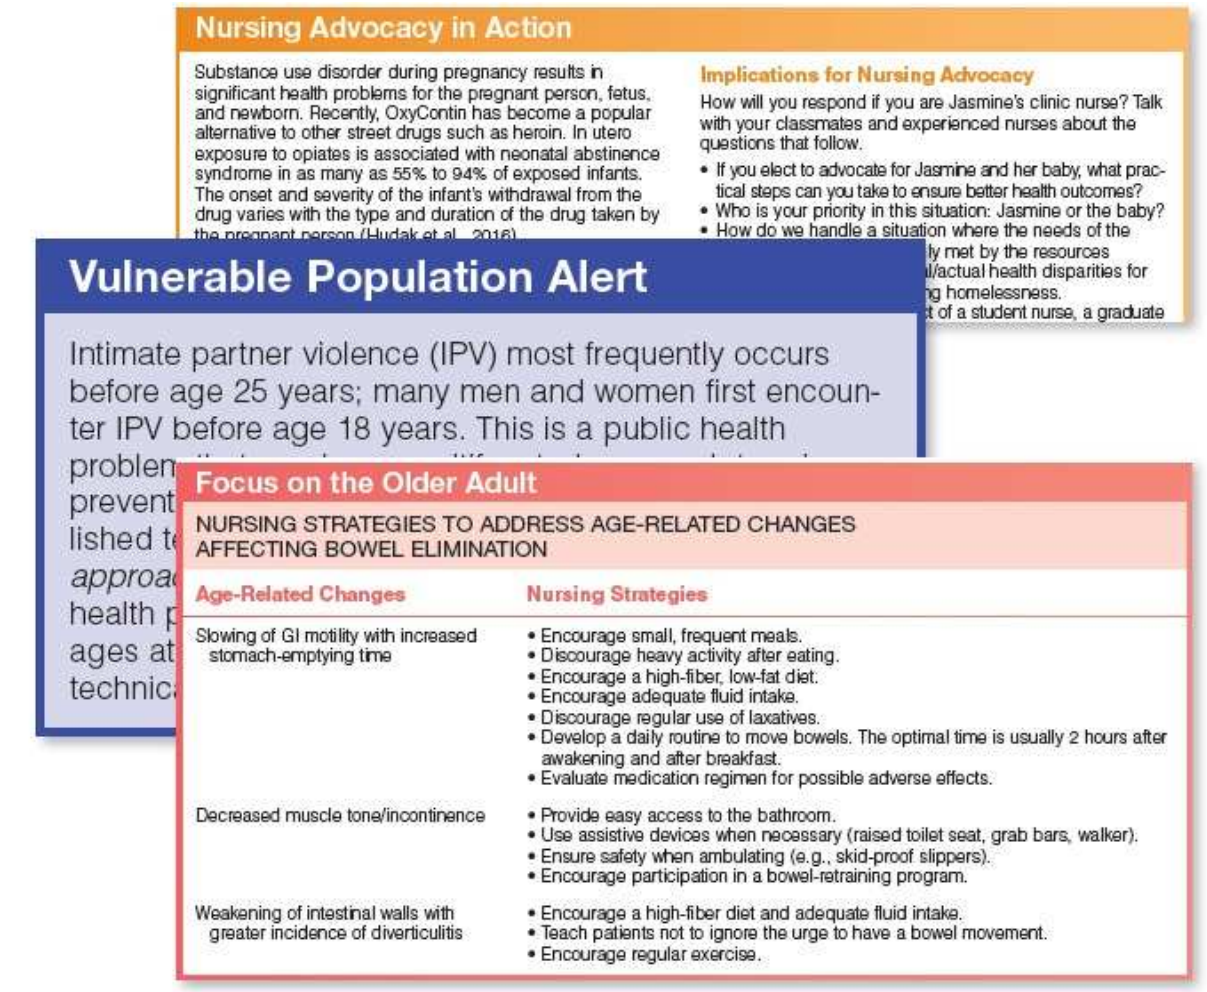
Patient Scenario

Jennifer Tyler, 44, has had several visits to her primary provider about her pain. She told the office nurse that she "doesn't know how much more of this I can take." Her history reveals that she has had an "aching pain, literally all over my body" for the last 3 months. Jennifer states, "It's taking over my life now. Everything I do hurts, and to make matters worse, I don't sleep well at night, and I can't even think straight." Specific symptoms she reported include fatigue, occasional muscle spasms and pain in her legs, aching in her right shoulder, constant lower back pain, headaches that are occurring on a more frequent basis, and general anxiety about her health. Jennifer reports that initially she tried "Advil® off and on" with some mild relief and even admits taking some "old muscle relaxants" that her husband had from a back injury. Despite the antidepressants and sleeping pills that were prescribed for her, she has not been able to get much in the way of pain relief. After their initial examination, her provider has ordered a variety of laboratory studies to try and determine exactly what is causing Ms. Tyler's pain. At this visit, they told Ms. Tyler that they s
pain and other sym
and want to see her

pregabalin (Lyrica®) was the first drug approved by the FDA to treat fibromyalgia. Tell Ms. Tyler that the provider may adjust her dose depending on how she tolerates the medicine and what kind of results she is getting from the drug. Caution her that dizziness and blurred vision may occur as side effects. Tell her if she has any signs of an allergic reaction, she should immediately stop taking the medication and report this to the health care provider. Inform her that she should avoid alcohol consumption while taking pregabalin and not drive if she experiences any dizziness or blurred vision. Explain to her that the provider may prescribe physical or occupational therapy for rehabilitation as she begins to rebuild her strength and stamina. Provide Ms. Tyler online resources, links, or apps to track her symptoms, locate a support group, and review other resources to increase the likelihood that Ms. Tyler is accessing appropriate, verified information on the internet. Encourage Ms. Tyler when she returns for her next visit to be prepared to ask her health care provider the following questions:

Teaching Tips 33-1

WOUND CARE AND HEALING



Health Topic	Teaching Tip	Why Is This Important?
Supplies	• Methods for obtaining dressing supplies such as purchasing from pharmacies, drug stores, discount stores, and medical supply stores • Considerations of costs and ease of use • Investigation about reimbursement by insurance or other source of health care financing	Patients need to be able to obtain appropriate supplies to perform prescribed care. Wound care will not be completed if supplies cannot be obtained for financial or other reasons, the wound care is complex, or the patient does not understand the wound care instructions.
Infection prevention	• Signs and symptoms of infection to be immediately reported to the health care provider • Need to watch for increased body temperature, flulike symptoms, red or separated wound edges, increased pain in the wound, and/or increased drainage that is thick and	Early detection of possible complications promotes early intervention and prevention of further complications. Preventative measures reduce transmission of microorganisms.

BE A PATIENT ADVOCATE!

Read the scenarios in the **Nursing Advocacy in Action** boxes and learn how you can advocate for vulnerable individuals.

NEW! Vulnerable Populations alerts will help you identify and individualize care for populations with actual or potential vulnerabilities.

Consider the special needs of the older adult with the **Focus on the Older Adult** boxes.

Nursing Advocacy in Action

Substance use disorder during pregnancy results in significant health problems for the pregnant person, fetus, and newborn. Recently, OxyContin has become a popular alternative to other street drugs such as heroin. In utero exposure to opiates is associated with neonatal abstinence syndrome in as many as 55% to 94% of exposed infants. The onset and severity of the infant's withdrawal from the drug varies with the type and duration of the drug taken by the pregnant person (Hudak et al., 2016).

Implications for Nursing Advocacy

How will you respond if you are Jasmine's clinic nurse? Talk with your classmates and experienced nurses about the questions that follow.

- If you elect to advocate for Jasmine and her baby, what practical steps can you take to ensure better health outcomes?
- Who is your priority in this situation: Jasmine or the baby?
- How do we handle a situation where the needs of the
ly met by the resources

NURSING STRATEGIES TO ADDRESS AGE-RELATED CHANGES AFFECTING BOWEL ELIMINATION

Age-Related Changes	Nursing Strategies
Slowing of GI motility with increased stomach-emptying time	• Encourage small, frequent meals. • Discourage heavy activity after eating. • Encourage a high-fiber, low-fat diet. • Encourage adequate fluid intake. • Discourage regular use of laxatives. • Develop a daily routine to move bowels. The optimal time is usually 2 hours after awakening and after breakfast. • Evaluate medication regimen for possible adverse effects.
Decreased muscle tone/incontinence	• Provide easy access to the bathroom. • Use assistive devices when necessary (raised toilet seat, grab bars, walker). • Ensure safety when ambulating (e.g., skid-proof slippers). • Encourage participation in a bowel-retraining program.
Weakening of intestinal walls with greater incidence of diverticulitis	• Encourage a high-fiber diet and adequate fluid intake. • Teach patients not to ignore the urge to have a bowel movement. • Encourage regular exercise.

GAIN NEW INSIGHTS!

Students, patients, nurses, and family caregivers share their experiences in boxes entitled *Through the Eyes of a Student, Through the Eyes of a Patient*, *Through the Eyes of a Nurse*, and *Through the Eyes of a Family Caregiver*. These real-life stories demonstrate how nursing can make a difference in the lives of patients and their families.

Through the Eyes of a Student

I entered my patient's room, knowing that she had had surgery less than 12 hours before my arrival, and introduced myself. I asked how she was feeling, to which she immediately responded, "I feel really sick. I think I'm going to throw up. I need something—now!" I told her that I would check the medication orders and be back as soon as possible. I walked quickly to the medication administration record, and there it was glaring at me in black and white on the eMAR: "Prochlorperazine, 10 mg IM q 6 hr PRN nausea or vomiting." My mind raced as I thought, "I have never given an IM injection. There has to be something else prescribed." I knew there wasn't. I found my clinical instructor and announced, "My patient needs an IM injection." Given the anxiety I was feeling, everything went surprisingly well as we prepared the medication. I went over the procedure one last time before entering the patient's room.

We approached the patient just in time for her to look

times, wiped the area with alcohol, and asked her if she was ready for the injection. *Big mistake!* She swiftly replied, "No, but get it over with." I took a minute to reassure her (and silently, me) again.

A little voice in my head repeated the words my *technologies* professor had said a million times, "Darting action is the key to a successful injection." So, I aimed at the bull's-eye that appeared in front of my eyes. My hand, which seemed to be moving in slow motion, propelled downward at a 90-degree angle. Secretly, I prayed that I would not hit my own hand. I looked down and it was a bull's-eye, thank goodness, but the needle had not penetrated the muscle! The patient successfully tensed her muscle tight enough to intercept the needle midflight. At that moment, she relaxed, probably because she thought the worst was over, and I pushed the needle into place. I stabilized the syringe at the end of the barrel, and began injecting the prochlorperazine slowly, watching

EXAMINE THE EVIDENCE!

Gain insight into the "why" behind nursing care. Consider **Research in Nursing: Bridging the Gap to Evidence-Based Practice** boxes to discover recent findings in nursing care and relate their relevance to nursing practice.

Research in Nursing

BRIDGING THE GAP TO EVIDENCE-BASED PRACTICE

Stethoscope Hygiene

Stethoscopes, like other patient care equipment, should be cleaned between patients and undergo routine disinfection to prevent the spread of microorganisms. This simple intervention is rarely done despite guideline recommendations (Holleck et al., 2020). What can be done to improve compliance by health care professionals?

Related Evidence

Holleck, J. L., Campbell, S., Alrawili, H., Frank, C., Merchant, N., Rodwin, B., Perez, M. F., Gupta, S., Federman, D. G., Chang, J. J., Vientos, W., & Dembry, L. (2020). Stethoscope hygiene: Using cultures and real-time feedback with bioluminescence-based adenosine triphosphate technology to change behavior. *American Journal of Infection Control, 48*(4), 380–385. https://doi.org/10.1016/j.ajic.2019.10.005

The purpose of this quality improvement project was to determine whether demonstrating what is growing on the stethoscopes of providers via culture or bioluminescence technology alters perceptions and improves compliance with stethoscope hygiene. In addition, the researchers sought to gain a better understanding of the beliefs and the barriers to stethoscope hygiene. Participants included medical students, house staff, and attending physicians on the medical wards at a Department of Veterans Affairs (VA) tertiary care teaching hospital. Beginning with the first week of their medicine inpatient rotations at the VA, providers were given the opportunity to culture their stethoscopes and swab for bioluminescence-based adenosine triphosphate testing before and after disinfection with alcohol pads, alcohol-based hand rub, or hydrogen peroxide disinfectant wipes. Beginning with the second week of their rotations, actual photographic images of stethoscope culture plates before and after disinfection were presented for visual impact at a morning report. Bioluminescence scores of stethoscopes before and after disinfection were provided in real-time and again when presenting images of the stethoscope cultures. Pre-surveys exploring beliefs and barriers to stethoscope hygiene were administered initially prior to any intervention and post-surveys were administered 2 days after presentation of the results. Baseline observations of hand and stethoscope hygiene rates were discreetly recorded at the start of rotations, after presenting the culture images and bioluminescence scores during the second week and during the fourth week of provider rotations. The bacteria isolated, colony-forming units (CFUs), and bioluminescence scores were tracked. This 4-week period was repeated for a total of three cycles. A total of 1,245 observed hand hygiene opportunities showed that compliance improved from 72.5% to 82.3% ($p < .001$). Observed patient–provider encounters (590) revealed no significant change in stethoscope hygiene rates of 10% initially and 5% afterward ($p = .08$), although self-reported rates trended from 56% to 67% postintervention ($p = .06$). Perceptions regarding stethoscope hygiene importance improved 8.5/10 to 9.3/10; $p = .04$. Disinfection with alcohol pads, alcohol-based hand rub, and hydrogen peroxide disinfectant wipes were equivalent in CFU reduction ($p = .21$). The top three barriers to stethoscope hygiene were forgetfulness, time constraints, and limited access to supplies. The authors concluded that showing providers what is growing on their stethoscopes improved "buy in" regarding stethoscope hygiene importance. Objective observations failed to show improvement in stethoscope hygiene rates, but hand hygiene performance improved. The authors noted a significant gap between what providers think they are doing and what they are actually doing.

Relevance to Nursing Practice

Disinfection of patient care equipment, such as stethoscopes, reduces bacteria on the equipment, including the potential to reduce and limit transmission of pathogens. Stethoscopes, like other patient care equipment, should be cleaned between patients and undergo routine disinfection. Nurses and other health care providers need to be aware of the potential barriers to implementation and make a conscious effort to implement equipment hygiene as part of patient care. Facilities must ensure adequate access to disinfection supplies and consider interventions to support use of disinfectants to reduce barriers to implementation.

Read the **PICOT in Practice: Asking Clinical Questions** to think about how you can do a systematic search, formulate questions, and apply evidence-based answers in your practice by following the PICOT model.

PICOT in Practice

ASKING CLINICAL QUESTIONS: ACUPUNCTURE/ACUPRESSURE

Scenario: You are a nurse working with a large maxillofacial surgery group who attended a conference on integrative nursing. One presenter that stood out discussed the benefits of acupuncture/acupressure in managing the gag reflex in patients undergoing dental procedures. Gagging is a common problem encountered during dental treatment, making therapeutic procedures distressing and often difficult or even impossible to perform. One of the surgeons asks if you learned something new at the conference and you discuss the results of the presentation.

The office currently only uses sedatives to facilitate sedation in patient undergoing procedures. You wonder if acupuncture/acupressure compared to sedatives has any benefit in the care of patients "specifically pediatric patients" undergoing procedures.

- **Population:** Children receiving sedation
- **Intervention:** Use of acupuncture/acupressure
- **Comparison:** Use of sedatives
- **Outcome:** Decreased gag reflex
- **Time:** During dental procedures

PICOT Question: Does the use of acupuncture/acupressure by a nonanesthesiologist compared to administration of sedatives result in depression of gag reflex in children undergoing dental treatment and improved experience?

Findings:

1. Ashley, P. F., Chaudhary, M., Lourenço-Matharu, L. (2018). Sedation of children undergoing dental treatment. *Cochrane Database of Systematic Reviews*, (12), CD003877. https://doi.org/10.1002/14651858.CD003877.pub5

Included 50 studies with a total of 3,704 children up to age for further well-designed and well-reported clinical trials to evaluate other potential sedation agents.

2. Eachempati, P., Kumbargere Nagraj, S., Kiran Kumar Krishanappa, S., George, R. P., Soe, H. H. K., Karanth, L. (2019). Management of gag reflex for patients undergoing dental treatment. *Cochrane Database of Systematic Reviews*, (11), CD011116. https://doi.org/10.1002/14651858.CD011116.pub3

The interventions used to manage gagging include antinausea medicines, sedatives, local and general anesthetics, herbal remedies, behavior therapy and cognitive behavior therapy, acupressure, acupuncture, laser, and prosthetic devices. This systematic review included four trials with 328 people (263 adults and 65 children who were ages 4 years and older). Of the trials reviewed, one compared acupuncture and acupressure (with thumb, device, and sea band) at P6 (point located three finger breadths below the wrist on the inner forearm in between the two tendons) to sham acupuncture and acupressure with and without sedation. One trial compared acupuncture at the P6 point to sham acupuncture. These trials reported both completion of dental procedure and reduction in gagging as their outcomes.

Level of Evidence I: systematic review.

Recommendations: Conscious sedation or moderate sedation is the ability of the patient to independently maintain an open mouth and respond sensibly to verbal commands. In addition, the patient will retain adequate function of protective reflexes such as the gag reflex. There is a fine line between a sedated patient and an anesthetized patient. The ideal sedative agent would reduce anxiety and improve behavior. Oral midazolam probably improves the behavior of children during

PREPARE FOR NCLEX!

Start preparing for NCLEX right from the beginning of your nursing education. The **Practicing for NCLEX** section at the end of each chapter uses the multiple-choice question format to test your knowledge of basic through complex concepts. Answers with rationales are provided for immediate reinforcement.

PRACTICING FOR NCLEX

1. Thirty-six hours after having surgery, a patient has a slightly elevated body temperature and generalized malaise as well as pain with redness at the surgical site. Which action is most appropriate?
   MAR
   - Acetaminophen 650 mg every 6 hours prn fever
   - Cefazolin (antibiotic) 1 g 1 hour preoperatively
   - Cefazolin 1 g, every 6 hours 3 times, postoperatively

   a. Documenting the findings and continuing to monitor

ACKNOWLEDGMENTS

This revision is the work of many talented and committed people; we wish to gratefully acknowledge the assistance of all who have contributed in any way to the completion of this project. Our first debt of gratitude is to all the nurse educators and students who have adopted the text and shared with us their experiences in using the teaching and learning package. We are deeply grateful for their revision suggestions and trust they will enhance the learning experiences of others.

The work of this revision was capably facilitated by our Development Editor, Kelly Horvath. She worked tirelessly behind the scenes to make sure that a superb, state-of-the-art product was delivered on time! When emails are flying back and forth on Sundays and holidays, you know you have the best! Our very special thanks to our Senior Acquisitions Editor Jonathan Joyce, Senior Development Editor, Julie Vitale, and Editorial Coordinator Erin Hernandez for their hard work and guidance throughout the project. Thank you to Stephen Druding of the Design department, and Jennifer Clements, Art Director, who brought a fresh look to the entire Taylor Suite of products. The Instructional Services Consultants also deserve special thanks for their focus on our products to provide curriculum guidance, instructional design, technology support, and training. We also want to thank Andrea Mann, who worked creatively on many aspects of the teaching/learning package to ensure that faculty and students alike are getting the best resources to facilitate learning.

We thank all who generously gave their time, ideas, and resources, and we gratefully acknowledge the special contributions of the following:

- Rick Brady, Joe Mitchell, Ken Kasper, Barbara Proud, Gates Rhodes, and Kathy Sloane, photographers.
- Marie Clark, who developed the math problems and solutions in the "Medications" chapter.
- Kathleen Lucente, RN, MT, CIC, Infection Control Manager at Paoli Hospital, Paoli, Pennsylvania, for advising and updating us on changing infection-control protocols.

We gratefully acknowledge the influence of our mentors and teachers who have influenced our thoughts and writing; each person we have been privileged to care for as nurses; our students, who continually challenge us to find more effective means to teach nursing; our professional colleagues; and perhaps most important, our families and friends, whose love sustained us through the long hours of research and writing.

Ethical Experience and Decision Making
Conflicts of Commitment

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Advocacy in Nursing Practice
Developing Clinical Reasoning and Clinical Judgment

Chapter 7 Legal Dimensions of Nursing Practice

Legal Concepts
Professional and Legal Regulation of Nursing Practice
Crimes and Torts
Legal Safeguards for the Nurse
Laws Affecting Nursing Practice
Developing Clinical Reasoning and Clinical Judgment

Chapter 8 Communication

Process of Communication
Forms of Communication
Levels of Communication
Factors Influencing Communication
Documenting Communication
Effective Professional Communication
Using Professional Communication in the Therapeutic Relationship
Developing Professional Therapeutic Communication Skills
Barriers to Communication
Disruptive Interpersonal Behavior and Communication
Impaired Verbal Communication
Developing Clinical Reasoning and Clinical Judgment

Chapter 9 Teaching and Counseling

Aims of Teaching and Counseling
Nurse as Teacher
Nurse as Counselor
Developing Clinical Reasoning and Clinical Judgment

Chapter 10 Leading, Managing, and Delegating

Leadership
Management
Implementing Leadership and Management Skills in Nursing Care
Developing Clinical Reasoning and Clinical Judgment

UNIT II **Health Care Delivery**

Chapter 11 Health Care Delivery System

Health Care: The Big Picture
Health Care Reform
Organizing Health Care: Primary, Secondary, and Tertiary Care
Organizing Health Care: Health Care Delivery Systems and Care Coordination
Paying for Health Care
Health Care Settings and Services
Health Care Facilities
Collaborative Care: The Interprofessional Health Care Team
Trends and Issues in Health Care Delivery
Health Care: A Right, a Privilege, or an Obligation of a Moral Society?
Nurses' Role in Health Care Reform
Developing Clinical Reasoning and Clinical Judgment

Chapter 12 Interprofessional Collaborative Practice and Care Coordination Across Settings

Community Health
Community-Based Nursing Care
Continuity of Care
Interprofessional Collaborative Practice
Care Coordination

Home Health Care Nursing
Home Visits
Developing Clinical Reasoning and Clinical Judgment

UNIT III **Processes of Thoughtful, Person-Centered Practice**

Chapter 13 Blended Competencies, Clinical Reasoning, and Processes of Person-Centered Care

Thoughtful Practice
Thoughtful, Person-Centered Practice
Professional Nurse
Clinical Judgment Model
Nursing Process
Reflective Practice
Developing Clinical Reasoning and Clinical Judgment

Chapter 14 Clinical Judgment

Concepts Related to Clinical Judgment
Models Related to Clinical Judgment
Developing Competency in Nursing Practice
Clinical Decision-Making Theories, Models, and Frameworks
Integrating Previous Knowledge
Importance of Reflection
Developing Clinical Reasoning and Clinical Judgment

Chapter 15 Assessing

Unique Focus of Nursing Assessment
Assessment, Clinical Reasoning, and Clinical Judgment
Assessment and Interpersonal Competence
Types of Nursing Assessments
Preparing for Data Collection
Collecting Data
Identifying Cues and Making Inferences
Validating Data
Clustering Related Data and Identifying Patterns
Reporting and Recording Data
Developing Clinical Reasoning and Clinical Judgment

Chapter 16 Diagnosis/Problem Identification

Evolution of Nursing Diagnosis
Unique Focus of Diagnosing
Diagnostic Reasoning, Clinical Reasoning, and Clinical Judgment
Diagnostic Reasoning and Interpersonal Competence
Data Interpretation and Analysis
Formulating and Validating Nursing Diagnoses and Problem Statements
Documenting Nursing Diagnoses and Patient Problems
Nursing Diagnosis: A Critique
Developing Clinical Reasoning and Clinical Judgment

Chapter 17 Outcome Identification and Planning

Unique Focus of Nursing Outcome Identification and Planning
Comprehensive Planning
Establishing Priorities
Identifying and Writing Outcomes
Identifying Nursing Interventions
Developing Evaluative Strategies
Communicating and Recording the Nursing Care Plan
Problems Related to Outcome Identification and Planning
A Final Word About Standardized Languages and Holistic, Person-Centered Care

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Developing Clinical Reasoning and Clinical Judgment

Chapter 18 Implementing

Unique Focus of Nursing Implementation
Critical Thinking/Clinical Reasoning and Judgment, and Implementing
Implementing and Interpersonal Competence
Types of Nursing Interventions
Implementing the Plan of Care
Continuing Data Collection and Risk Management
Documenting Nursing Care
When a Patient Does Not Cooperate With the Plan of Care
Delegating Nursing Care
Guide for Students
Developing Clinical Reasoning and Clinical Judgment

Chapter 19 Evaluating

Unique Focus of Nursing Evaluation
Clinical Reasoning and Judgment and Evaluating
Evaluating Quality Care
Developing Clinical Reasoning and Clinical Judgment

Chapter 20 Documenting and Reporting

Documenting Care
Reporting Care or Requesting Action
Conferring About Care
Developing Clinical Reasoning and Clinical Judgment

Chapter 21 Informatics and Health Care Technologies

History of Nursing Informatics
Nursing Informatics Defined
Nursing Informatics Education
Nursing Informatics Practice
System Development Lifecycle
Informatics Concepts
Emerging Areas in the Field of Informatics
Developing Clinical Reasoning and Clinical Judgment

UNIT IV Developmentally Appropriate Care

Chapter 22 Developmental Concepts

Principles of Growth and Development
Factors Influencing Growth and Development
Overview of Classic Developmental Theories
Applying Theories of Growth and Development to Nursing Care
Developing Clinical Reasoning and Clinical Judgment

Chapter 23 Conception Through Young Adulthood

Conception and Prenatal Development
Neonates: Birth to 28 Days
Infants: 1 Month to 1 Year
Toddlers: 1 to 3 Years
Preschoolers: 3 to 6 Years
School-Aged Children: 6 to 12 Years
Adolescents and Young Adults
Developing Clinical Reasoning and Clinical Judgment

Chapter 24 Middle and Older Adulthood

Biological Theories of Aging
Middle Adulthood

Older Adulthood
Caring for an Aging Population
Developing Clinical Reasoning and Clinical Judgment

UNIT V Actions Basic to Nursing Care

Chapter 25 Asepsis and Infection Control

Infection
Developing Clinical Reasoning and Clinical Judgment

Chapter 26 Vital Signs

Temperature
Pulse
Respirations
Blood Pressure
Diagnosing Actual or Potential Health Problems and Needs
Teaching Vital Signs for Self-Care at Home
Developing Clinical Reasoning and Clinical Judgment

Chapter 27 Health Assessment

Health Assessment
Health History
Physical Assessment
Documentation of Data
Developing Clinical Reasoning and Clinical Judgment

Chapter 28 Safety, Security, and Emergency Preparedness

Person-Centered Aspects of Safety and Security
Developmental Considerations
Aspects of Safety and Security
Population-Based Aspects of Safety and Security
Developing Clinical Reasoning and Clinical Judgment

Chapter 29 Complementary and Integrative Health

Introduction to Complementary Health Approaches
Complementary Health Approaches Categories
Nursing Implications of Complementary Health Approaches
Developing Clinical Reasoning and Clinical Judgment

Chapter 30 Medications

Principles of Pharmacology
Principles of Medication Administration
Developing Clinical Reasoning and Clinical Judgment

Chapter 31 Perioperative Nursing

The Surgical Experience
Postoperative Nursing Care
Developing Clinical Reasoning and Clinical Judgment

UNIT VI Promoting Healthy Physiologic Responses

Chapter 32 Hygiene

Hygiene Practices
Factors Affecting Personal Hygiene
Developing Clinical Reasoning and Clinical Judgment

Chapter 33 Skin Integrity and Wound Care

Anatomy and Physiology of the Integumentary System
Wounds and Pressure Injuries

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Heat and Cold Therapy
Developing Clinical Reasoning and Clinical Judgment

Chapter 34 Activity

Physiology of Movement and Alignment
Factors Affecting Movement and Alignment
Exercise
Developing Clinical Reasoning and Clinical Judgment

Chapter 35 Rest and Sleep

Rest and Sleep
Physiology of Sleep
Rest and Sleep Requirements and Patterns
Physical and Psychological Effects of Insufficient Sleep
Factors Affecting Rest and Sleep
Common Sleep Disorders
Developing Clinical Reasoning and Clinical Judgment

Chapter 36 Comfort and Pain Management

Experience of Pain
Factors Affecting the Pain Experience
Developing Clinical Reasoning and Clinical Judgment

Chapter 37 Nutrition

Principles of Nutrition
Factors Affecting Nutrition
Developing Clinical Reasoning and Clinical Judgment

Chapter 38 Urinary Elimination

Anatomy and Physiology
Factors Affecting Urination
Developing Clinical Reasoning and Clinical Judgment

Chapter 39 Bowel Elimination

Anatomy and Physiology
Factors Affecting Bowel Elimination
Developing Clinical Reasoning and Clinical Judgment

Chapter 40 Oxygenation and Perfusion

Anatomy and Physiology of Oxygenation
Factors Affecting Cardiopulmonary Functioning
Developing Clinical Reasoning and Clinical Judgment

Chapter 41 Fluid, Electrolyte, and Acid–Base Balance

Principles of Fluid, Electrolytes, and Acid–Base Balance
Disturbances in Fluid, Electrolyte, and Acid–Base Balance
Developing Clinical Reasoning and Clinical Judgment

UNIT VII Promoting Healthy Psychosocial Responses

Chapter 42 Self-Concept

Overview of Self-Concept
Developing Clinical Reasoning and Clinical Judgment

Chapter 43 Stress and Adaptation

Basic Concepts of Stress and Adaptation
Maintenance of Physiologic and Psychological Homeostasis
Effects of Stress
Factors Affecting Stress and Adaptation

Stress and Adaptation in Nursing
Developing Clinical Reasoning and Clinical Judgment

Chapter 44 **Loss, Grief, and Dying**

Concepts of Loss and Grief
Dying and Death
Factors that Affect Grief and Dying
Suicide Prevention: Mental Health First Aid
Nurse as Role Model
Developing Clinical Reasoning and Clinical Judgment

Chapter 45 **Sensory Functioning**

Sensory Experience
Disturbed Sensory Perception
Factors Affecting Sensory Stimulation
Developing Clinical Reasoning and Clinical Judgment

Chapter 46 **Sexuality**

Sexual Health
Sexual Expression
Factors Affecting Sexuality
Sexual Harassment
Nurse as Role Model
Developing Clinical Reasoning and Clinical Judgment

Chapter 47 **Spirituality**

Spiritual Dimension
Concepts Related to Spirituality and Spiritual Health
Factors Affecting Spirituality
Religion and Law, Ethics, and Medicine
Parish Nursing
Developing Clinical Reasoning and Clinical Judgment

Index

Resources available on thePoint

Glossary

Appendix A Guidelines for Delegation Decision Making

Appendix B Equivalents

Appendix C Adult Laboratory Values

Case Studies in this Book

TWO-PART CASES THAT UNFOLD ACROSS CHAPTERS

UNIT I: Foundations of Thoughtful, Person-Centered Nursing Practice

Chapter 2: Theory, Research, and Evidence-Based Practice 30
Unfolding Patient Stories: Sara Lin, Part 1, 43

Chapter 3: Health, Wellness, and Health Disparities 53
Unfolding Patient Stories: Kim Johnson, Part 1, 56

Chapter 7: Legal Dimensions of Nursing Practice 143
Unfolding Patient Stories: Jared Griffin, Part 1, 159

Chapter 9: Teaching and Counseling 209
Unfolding Patient Stories: Rashid Ahmed, Part 1, 232

UNIT II: Health Care Delivery

Chapter 11: Health Care Delivery System 270
Unfolding Patient Stories: Kim Johnson, Part 2, 292

Chapter 12: Interprofessional Collaborative Practice and Care Coordination Across Settings 303
Unfolding Patient Stories: Vernon Russell, Part 1, 316

Unit III: Processes of Thoughtful, Person-Centered Practice

Chapter 18: Implementing 474
Unfolding Patient Stories: Mona Hernandez, Part 1, 484

Chapter 19: Evaluating 497
Unfolding Patient Stories: Sara Lin, Part 2, 503

Chapter 20: Documenting and Reporting 517
Unfolding Patient Stories: Rashid Ahmed, Part 2, 523

UNIT IV: Developmentally Appropriate Care

Chapter 23: Conception Through Young Adulthood 593
Unfolding Patient Stories: Christopher Parrish, Part 1, 625

Chapter 24: Middle and Older Adulthood 629
Unfolding Patient Stories: Josephine Morrow, Part 1, 640

UNIT V: Actions Basic to Nursing Care

Chapter 28: Safety, Security, and Emergency Preparedness 835
Unfolding Patient Stories: Josephine Morrow, Part 2, 859

Chapter 30: Medications 912
Unfolding Patient Stories: Mona Hernandez, Part 2, 918

Chapter 31: Perioperative Nursing 1036

Unfolding Patient Stories: Edith Jacobson, Part 1, 1044

UNIT VI: Promoting Healthy Physiologic Responses

Chapter 32: Hygiene 1088
Unfolding Patient Stories: Christopher Parrish, Part 2, 1107

Chapter 35: Rest and Sleep 1301
Unfolding Patient Stories: Edith Jacobson, Part 2, 1316

Chapter 39: Bowel Elimination 1516
Unfolding Patient Stories: Marvin Hayes, Part 1, 1527

UNIT VII: Promoting Healthy Psychosocial Responses

Chapter 42: Self-Concept 1736
Unfolding Patient Stories: Marvin Hayes, Part 2, 1745

Chapter 43: Stress and Adaptation 1763
Unfolding Patient Stories: Vernon Russell, Part 2, 1775

Chapter 46: Sexuality 1860
Unfolding Patient Stories: Jared Griffin, Part 2, 1880

CASES THAT UNFOLD WITHIN CHAPTERS

UNIT I: Foundations of Thoughtful, Person-Centered Nursing Practice

Chapter 1: Introduction to Nursing and Professional Formation 4
Roberto Pecorini, age 38 14
Ahmad Basshir, age 62 14, 15
Michelle Fine, age 19 15

Chapter 2: Theory, Research, and Evidence-Based Practice 30
Maribella Santos 33, 34
Joe Wimmer 35, 38
Rachel Whang, age 57 38

Chapter 3: Health, Wellness, and Health Disparities 53
Sara Thurston 54, 66, 70, 72
Daniel Sternman, age 27 57, 59, 67
Ruth Jacobi, age 62 59, 71

Chapter 4: Health of the Individual, Family, Community, and Environment 77
Rolanda Simpkins, age 16 80, 86
Samuel Kaplan, age 80 80, 81
Carlotta Rios, age 17 81, 82, 86

Chapter 5: Culturally Respectful Care 95
Khalifa Abdul Hakim 98, 101
Danielle Dorvall 100, 104
Janice Goldberg, age 23 100

Chapter 6: Values, Ethics, and Advocacy 116
Chengyu Zhang, age 32 117, 123, 137
William Raines, age 68 122, 137
Marissa Sandoval, age 44 123, 126

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Chapter 7: Legal Dimensions of Nursing Practice 143
Meredith Bedford 146, 159
Ella Rodriguez, age 8 147, 155, 160
Ramone Scott, age 66 164

Chapter 8: Communication 172
Randolph Gordon 175, 176, 187, 198
Susie Musashi, age 3 176, 177, 180, 181, 191, 199
Mrs. Russellinski, age 75 175, 178, 183, 204

Chapter 9: Teaching and Counseling 209
Alicia Bonet 212, 213, 227, 228
Rachel Blumenthal, age 40 212, 222, 227, 233
Marco García Ramírez 213, 220, 226

Chapter 10: Leading, Managing, and Delegating 242
Jack Camp 243, 250, 255
Rehema Kohls 246, 256
Stephen Wall, age 65 247, 248, 257

UNIT II: Health Care Delivery

Chapter 11: Health Care Delivery System 270
Margaret Ritchie, age 63 287, 292
Maritza Cortes, age 37 289, 297
Paul Cochran, age 55 291

Chapter 12: Interprofessional Collaborative Practice and Care Coordination Across Settings 303
Laura Degas, age 78 304, 323
Joey Marshall 311, 334
Jeff Hart, age 9 324

Unit III: Processes of Thoughtful, Person-Centered Practice

Chapter 13: Blended Competencies, Clinical Reasoning, and Processes of Person-Centered Care 342
Jermaine Byrd, age 58 349, 362
Addie Warner 351, 355, 365, 371
Charlotte Horvath 351, 368

Chapter 14: Clinical Judgment 381
Ashley Dotski 384
Daniel Ramirez 388, 393
Kallie McDonald 397

Chapter 15: Assessing 403
Sylvia Wu, age 17 404, 408, 416, 418, 424
Susan Morgan, age 34 406, 417, 419
James Farren 414

Chapter 16: Diagnosis/Problem Identification 429
Antonia Zuccarelli 434
Angie Clarkson 435, 437
Martin Prescott, age 46 436, 444

Chapter 17: Outcome Identification and Planning 449
Darla Jefferson, age 29 452, 455, 464
Elijah Wolinski, age 85 454, 456, 470
Glenda Kronk, age 35 460, 462

Chapter 18: Implementing 474
Antoinette Browne 478, 479, 488
Estelle Morrissey, age 86 479, 490
James McMahon, age 62 483, 485, 490

Chapter 19: Evaluating 497
Nicholas Soros, age 68 501
Mioshi Otsuki 501, 506
Tyler Jameson 503

Chapter 20: Documenting and Reporting 517
Jason Chandler, age 15 522, 535, 543
Phillippe Baron, age 52 529, 534, 538
Millie Delong, age 44 535, 536, 544

Chapter 21: Informatics and Health Care Technologies 549
Danielle Smith 555, 557
Jorge Bobadilla 564
Frank Albrecht, age 72 564

UNIT IV: Developmentally Appropriate Care

Chapter 22: Developmental Concepts 574
Juan Alvarez, age 8 575, 583, 586
Melanie Kimber, age 24 579, 581, 582, 583, 587
Joseph Logan, age 70 583, 585

Chapter 23: Conception Through Young Adulthood 593
Hillarie Browning, age 2 603, 608
Nate Pelton, age 11 613, 615
Darlene Schneider, age 14 619, 623

Chapter 24: Middle and Older Adulthood 629
Rosemary Mason, age 49 632, 634
Larry Jenkins, age 67 637, 638, 641
Ethel Peabody, age 88 640, 645, 647

UNIT V: Actions Basic to Nursing Care

Chapter 25: Asepsis and Infection Control 662
Esther Bailey, age 72 668, 671, 677, 687
Giselle Turheis, age 38 669, 691
Jackson Ray Ivers 683, 684

Chapter 26: Vital Signs 715
Tomas Esposito 718, 728
Noah Shoolin, age 2 719, 724, 733
Doretha Renfrow, age 65 735, 739

Chapter 27: Health Assessment 773
Billy Collins, age 9 776, 791, 801
Ramona Lewis, age 22 777, 788
Tammy Browning 778, 781, 816

Chapter 28: Safety, Security, and Emergency Preparedness 835
Juanita and Inez Flores 842, 855, 863
Kara Greenwood 846, 865
Bessie Washington, age 77 849, 854, 855, 857

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Chapter 29: Complementary and Integrative Health 882
Sylvia Puentes 887, 892, 893
Lee Chen, age 65 892, 896
Brian Legett, age 30 897, 898

Chapter 30: Medications 912
Mildred Campbell, age 65 919, 935
François Baptiste 920, 933
Regina Sauder, age 73 923

Chapter 31: Perioperative Nursing 1036
Molly Greenbaum, age 38 1040, 1048
Marcus Benjamin, age 73 1042, 1046, 1061
Gabrielle McAllister, age 5 1044

UNIT VI: Promoting Healthy Physiologic Responses

Chapter 32: Hygiene 1088
Sonya Delamordo 1091, 1092, 1100, 1104
Andrew Craig, age 68 1098
Kylie Simpson, age 20 1105

Chapter 33: Skin Integrity and Wound Care 1148
Lucius Everly, age 52 1154, 1158, 1162, 1179, 1180, 1194
Sam Bentz, age 56 1157
Mary Biesicker, age 84 1175

Chapter 34: Activity 1239
Maggie Wyatt 1244, 1249, 1251, 1260, 1274, 1276, 1277
Kelsi Lester, age 10 1246, 1249, 1255, 1259
Quan Hong Nguyen, age 75 1249, 1265, 1268, 1273

Chapter 35: Rest and Sleep 1301
Charlie Bitner, age 86 1304, 1305, 1316, 1321, 1326
Jeanette and Abby Clark 1306, 1309, 1319
Lydia Omeara, age 30 1309, 1310, 1318, 1322

Chapter 36: Comfort and Pain Management 1336
Xavier Malton, age 5 1340, 1345, 1353, 1357, 1369, 1375
Sheree Lincoln, age 42 1343, 1348, 1349, 1371
Carla Potter, age 72 1348, 1359

Chapter 37: Nutrition 1388
William Johnston, age 42 1391, 1393, 1395, 1406, 1412
Susan Oakland, age 21 1396, 1399
Charles Gallagher, age 67 1396, 1403, 1409, 1423

Chapter 38: Urinary Elimination 1448
Midori Morita, age 69 1453, 1455, 1468, 1469, 1472
Anna Galinski, age 85 1454, 1463, 1464, 1467
Elana Jaspers, age 83 1456

Chapter 39: Bowel Elimination 1516
Alberta Franklin, age 55 1520, 1540, 1550
Leroy Cobbs 1524, 1535
Jeremy Green, age 4 1537

Chapter 40: Oxygenation and Perfusion 1584

Tyrone Jacobs, age 12 1589, 1596, 1602, 1611
Yan Kim, age 57 1594, 1597, 1624
Joan McIntyre, age 72 1594, 1599, 1606

Chapter 41: Fluid, Electrolyte, and Acid–Base Balance 1668
Jeremiah Stein, age 22 1672, 1679, 1692
Grace Gilligan, age 28 1674, 1685, 1693, 1700, 1701
Jack Soo Park, age 78 1679, 1692, 1703

UNIT VII: Promoting Healthy Psychosocial Responses

Chapter 42: Self-Concept 1736
Anthony Santorini 1738, 1744, 1747
Delores Sparks, age 72 1739, 1749, 1750
Melissa Motsky, age 31 1744

Chapter 43: Stress and Adaptation 1763
Christopher Weiss 1764, 1770, 1776, 1777, 1782, 1783
Joan Rogerrio 1766, 1773, 1775, 1776, 1778
Mei Fu, age 24 1776 Chapter 44: Loss, Grief, and Dying 1792
Manuel Perez, age 68 1793, 1805
Yvonne Malic, age 20 1793
Anna Maria Esposita

Chapter 45: Sensory Functioning 1827
Muriel Hao, age 56 1830, 1839, 1843, 1846
Ori Soltes, age 28 1831, 1834, 1847, 1851
Dolores Pirolla, age 74 1833, 1834, 1843, 1851

Chapter 46: Sexuality 1860
Amy Liu 1861, 1874, 1875
Paul Rojas 1864, 1872, 1878, 1884, 1893
Jefferson Smith 1874, 1875, 1881

Chapter 47: Spirituality 1905
Choi Min Lai 1913, 1916, 1918
Margot Zeuner, age 75 1916, 1925
Kevin Gargan, age 38 1918, 1920

CONCEPT MAPS

Chapter 31: Perioperative Nursing

Research in Nursing

BRIDGING THE GAP TO EVIDENCE-BASED PRACTICE

8-1 Workplace Incivility
9-1 Educational Needs of Family Caregivers
22-1 The Impact of Job Loss on Maternal Sensitivity
23-1 Considering Childhood Obesity in Light of COVID-19
24-1 Interprofessional Collaborative Practice (IPCP) Models
25-1 Hand Hygiene Compliance in the ICU: A Systematic Review
26-1 Arm versus Leg/Ankle Blood Pressure Measurement
27-1 Stethoscope Hygiene
28-1 Staying Abreast of the Science During a Pandemic
29-1 Yoga and Mindfulness
30-1 Practice Environments and Medication Errors
31-1 Description of Missed Perioperative Nursing Care
32-1 Bathing and Health Care–Associated Infections
33-1 Reducing the Incidence of Hospital-Acquired Pressure Injuries
34-1 Older Adults Experiences With Ambulation During Hospitalization
35-1 Earplugs and Eye Masks and Quality of Sleep in the Cardiac Care Unit
36-1 Examination of the Effects of Implementing a Nurse-Led Pain Program for Patients With Nonmalignant Chronic Pain
37-1 Enteral Feeding in the Prone Position
38-1 Self-Intermittent Catheterization
39-1 Living with an Ostomy
40-1 Tracheostomy Dressing Changes and Nurse Innovators
41-1 Central Venous Access Devices and Patients' Experiences
42-1 Nursing Students' Understanding of the Concept of Self-Esteem
43-1 Resilience in Nursing
44-1 Interpreting Do-Not-Resuscitate Orders
44-2 Helping Patients and Families Make Decisions About End-of-Life Treatment and Care
45-1 Caring for Visually Impaired Patients in the Hospital
45-2 Music, Sleep, and Well-Being
46-1 Transphobia
47-1 Critical Care Nurses' Perceived Need for Guidance in Addressing Spirituality in Critically Ill Patients

Guidelines for Nursing Care

12-1 Preparing the Room for Patient Admission
15-1 Promoting a Caring Interview
25-1 Hand Hygiene: Using an Alcohol-Based Handrub
26-1 Using a Hypothermia Blanket to Regulate Body Temperature
26-2 Assessing Peripheral Pulse Using a Portable Doppler Ultrasound Device
26-3 Assessing the Apical Pulse
26-4 Taking an Apical–Radial Pulse
26-5 Assessing Orthostatic Hypotension
26-6 Assessing Blood Pressure Using a Doppler Ultrasound
26-7 Assessing Blood Pressure at the Popliteal Artery
27-1 Obtaining Height and Weight With an Upright Balance Scale
27-2 Measuring Pupillary Reaction, Size, Accommodation, and Convergence
27-3 Assessing Extraocular Movements and Peripheral Vision
27-4 Palpating the Breasts
27-5 Assessing Muscle Strength
30-1 Using an Insulin Injection Pen
30-2 Applying Transdermal Patches
30-3 Instilling Eye Drops
30-4 Instilling Ear Drops
30-5 Instilling Nose Spray
30-6 Inserting Vaginal Cream or Suppository
30-7 Inserting a Rectal Suppository
30-8 Using an Inhaled Medication Device
31-1 Teaching Deep-Breathing Techniques
31-2 Effective Coughing
31-3 Providing Preoperative Patient Care: Hospitalized Patient (Day of Surgery)
31-4 Promoting Postoperative Rest and Comfort
32-1 Providing Perineal Care
32-2 Providing Body Piercing Care
32-3 Shampooing a Patient's Hair in Bed
32-4 Shaving with a Standard Razor
32-5 Providing Foot Care
33-1 Measuring Wounds and Pressure Injuries
33-2 Preventing Pressure Injuries
33-3 Cleaning Wounds
33-4 Applying Bandages and Binders
33-5 Removing Staples and Sutures
33-6 Assisting With a Sitz Bath
36-1 Caring for Patients Receiving Epidural Opioids
37-1 Assessment and pH Measurement of Gastric Contents
37-2 Monitoring Administration of Parenteral Nutrition
38-1 Obtaining a Clean-Catch or Midstream Urine Specimen
38-2 Obtaining a Urine Specimen From an Indwelling Urinary Catheter
38-3 Caring for a Hemodialysis Access
38-4 Caring for a Peritoneal Dialysis Catheter
39-1 Digital Removal of Fecal Impaction
40-1 Teaching Patients to Use an Incentive Spirometer
40-2 Transporting a Patient With a Portable Oxygen Cylinder
40-3 Monitoring a Patient With a Chest Tube
40-4 Inserting an Artificial Airway
41-1 Measuring Fluid Intake and Output
41-2 Regulating Intravenous Flow Rate
43-1 Reducing Anxiety on Admission to a Health Care Facility
43-2 Relaxation Activities

UNIT I Foundations of Thoughtful, Person-Centered Nursing Practice

Nursing is both an art and a science. It is a profession that uses specialized knowledge and skills to promote wellness and to provide care for people in both health and illness in a variety of practice settings. Unit I introduces concepts that provide the foundation for professional nursing practice. Chapters in this unit explore nursing and professional formation; theory, research, and evidence-based nursing practice; health, wellness, and health disparities; cultural diversity; basic needs and health of people, families, and the community; ethical and legal dimensions of nursing practice; communication; teaching and counseling; and leadership, managing, and delegating.

Historical perspectives, educational preparation, professional organizations, and guidelines for professional nursing practice serve as a basis for understanding what nursing is and how it is organized. Nursing theories and nursing research provide a foundation for evidence-based nursing practice, defining the rationale for nursing actions and offering a focus for nursing care. The diverse society in which nurses care for others mandates the ability to provide respectful care for all, especially the most vulnerable, and a commitment to antiracism. An understanding of basic human needs and the individualized definitions of wellness and illness prepare the nurse to integrate the human dimensions—the physical, intellectual, emotional, sociocultural, spiritual, and environmental aspects of each person—into nursing care to promote wellness, prevent illness, restore health, and facilitate coping with altered function or death. An understanding of the influence of values on human behavior and of the ethical dimensions of nursing practice is essential to responsible and accountable patient care. Sensitivity to the legal implications of professional nursing practice is imperative in today's culture. Finally, this unit describes competencies that are essential to every professional nurse: professional communication; teaching and counseling; and leadership, management, and delegation.

Unit I explores the foundations for thoughtful, person-centered nursing practice from both the perspective of the nurse and a person-centered holistic understanding of the patient. You will be introduced to a challenging and rewarding profession and be provided with a knowledge base to ground the development of caregiving skills and professional relationships and behaviors. You will also find a heightened emphasis on the nurse's self-care behaviors.

"Basic to any philosophy of nursing seems to be these three concepts: (1) reverence for the gift of life; (2) respect for the dignity, worth, autonomy, and individuality of each human being; (3) resolution to act dynamically in relation to one's beliefs."

Ernestine Wiedenbach (1900–1996), *a faculty member at Yale University School of Nursing, where she developed her model of nursing from years of experience in various nursing positions*

1

Introduction to Nursing and Professional Formation

Roberto Pecorini

Roberto is a 38-year-old man diagnosed with metastatic colon cancer. Having undergone radiation treatments and chemotherapy, he is extremely weak and malnourished. He is receiving intravenous fluids via a central venous catheter. He has two pressure injuries on his sacrum, each approximately 2 cm in diameter, requiring wound care. He also has a colostomy that he cannot care for independently.

Michelle Fine

Michelle, a 19-year-old first-time mother who was discharged with her healthy 7-lb 8-oz baby girl 2 days ago, calls the nursery. She reports, “My baby isn’t taking to my breast and she hasn’t had any real feeding for 24 hours.”

Ahmad Basshir

Ahmad, a 62-year-old man who is at risk for heart disease, is being taught about lifestyle modifications, such as diet and exercise. He states, “Just save your breath. Why should I bother about all that? I’d be

better off dead than living like I am now, anyway!”

Learning Outcomes

After completing the chapter, you will be able to accomplish the following:

. Describe the historical background of nursing, definitions of nursing, and the status of nursing as a profession and as a discipline.
. Explain the aims of nursing as they interrelate to facilitate maximal health and quality of life for patients.
. Explain how nursing qualifies as a profession.
. Describe the various levels of educational preparation in nursing.
. Discuss the effects on nursing practice of nursing organizations, standards of nursing practice, nurse practice acts, and the nursing process.
. Identify current trends in nursing.
. Discuss the importance of self-care in relation to the demands of the nursing profession and the duty to model healthy behaviors.

Nursing Concepts

Professional behaviors

licensure
mindfulness
nurse practice acts
nursing
nursing process
profession
reciprocity
resilience
secondary traumatic stress
standards

What is nursing? Consider the following examples of who nurses are and what they do:

- Delton Nix, RN, graduated from an associate degree nursing program 3 years ago. He is now working full-time as a staff nurse in a hospital medical unit while attending school part-time toward a baccalaureate degree in nursing; his goal is to become a nurse anesthetist.
- Jeiping Wu, RN, MSN, FNP, specializes as an advanced practice family nurse practitioner. She has an independent practice in a rural primary health clinic.
- Samuel Cohen, LPN, decided to follow his life’s dream to become a nurse after 20 years as a postal worker. After examining all his options and goals, he completed a practical nursing program and is now a member of an emergency ambulance crew in a large city.
- Amy Orlando, RN, BSN, graduated 2 years ago and recently began a new job in an urban community health service.
- Ed Neill, RN, DNP, is the Chief Nursing Informatics Officer at a large health system.
- Roxanne McDaniel, RN, PhD, with a doctorate in nursing, teaches and conducts research on moral distress at a large university.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

These examples show how difficult it is to describe nursing simply. If everyone in your class were asked to complete the sentence, "Nursing is …," there would be many different responses, because each person would answer based on their own personal experience and knowledge of nursing. As you progress toward graduation and as you practice nursing after graduation, your own definition will reflect changes as you learn about and experience nursing.

Nursing is a profession focused on assisting people, families, and communities to attain, recover, and maintain optimum health and function from birth to old age. Nurses act as a bridge between an often extremely vulnerable public and the health care resources that can literally make the difference between life and death, health and disease or disability, and well-being and discomfort. Yale School of Nursing faculty member and philosopher Mark Lazenby, PhD, APRN, FAAN, describes nursing as a "profoundly radical profession that calls society to equality and justice, to trustworthiness, and to openness. The profession is also radically political: it imagines a world in which the conditions necessary for health are enjoyed by all people" (Lazenby, 2017). According to an annual Gallup survey, the public has rated nursing as the most honest and ethical profession in America for 18 years straight. The only exception was 2001 when firefighters following the attacks on September 11 were named the most honest and ethical.

In 2020, the world celebrated the International Year of the Nurse and Midwife on the 200th anniversary of the birth of Florence Nightingale. You will want to research Nursing Now (http://www.nursingnow.org/launch/), a 3-year (2018–2020) global campaign that aimed to improve health by raising the profile and status of nursing worldwide. Run in collaboration with the World Health Organization (WHO) and the International Council of Nurses, Nursing Now sought to empower nurses to take their place at the heart of tackling 21st-century health challenges and maximize their contribution to achieving Universal Health Coverage. The campaign focused on five core areas: (1) ensuring that nurses and midwives have a more prominent voice in health policy making; (2) encouraging greater investment in the nursing workforce; (3) recruiting more nurses into leadership positions; (4) conducting research that helps determine where nurses can have the greatest impact; and (5) sharing of best nursing practices.

While the world was celebrating nurses and midwives in 2020, the COVID-19 pandemic struck, placing nurses and other health care professionals on the frontlines, literally, of the battle to save lives. With most visitors restricted from hospitals and nursing homes, nurses were suddenly the last human faces seen by the dying and the family's only point of contact. For too many nurses, the appropriate personal protective equipment (PPE) was in short supply, and many had to make anguished decisions about how to balance their commitment to patients, their families, and themselves. Nurses suddenly became superheroes, and the public offered us free hotel rooms, free food, and nightly cheers. Some nurses understandably were less enthused about the public accolades and more concerned about not having the PPE and other resources needed to do their jobs well. Never was nursing more valued, more challenging, or more dangerous. Never was the public more appreciative of nurses.

QSEN Reflective Practice: Cultivating QSEN Competencies

CHALLENGE TO ETHICAL AND LEGAL SKILLS

During nursing school, I was working as a nurse's aide on a busy oncology unit. It was here that I met Roberto Pecorini, a 38-year-old man diagnosed with metastatic colon cancer. He had undergone radiation treatments and chemotherapy and was extremely weak and malnourished. He was receiving numerous intravenous fluids via a central venous catheter. In addition, he had developed two pressure injuries on his sacrum, each approximately 1½ in in diameter, that required wound care. He also had a colostomy that he could not care for independently.

Although the staff was very helpful, the orientation I received to the unit was brief because they were very short staffed. During one occasion, shortly after I had been oriented to the floor, I was working a night shift and was the only nurse's aide on the unit. The nurses I was working with asked me to care for Mr. Pecorini, including performing several tasks and skills with which I was unfamiliar. In addition to my lack of familiarity with skills such as changing central line dressings and performing blood draws and wound care, I was not licensed to perform these tasks. I felt uncomfortable performing these skills on my own. However, the nurses were extremely busy, and I wanted to help them as much as possible. If I performed these skills on my own, I could be putting the patient at risk. Moreover, I could be threatening the licenses of the nurses.

Thinking Outside the Box: Possible Courses of Action

- Perform the tasks requested despite the fact that I had little experience with them.
- Inform the nurses that I did not feel comfortable completing these skills on my own and ask that they assign me other tasks within my scope of duty.
- Ask the nurses to be present when I performed these tasks so that they could observe my skills and intervene if necessary.
- Refrain from performing these tasks and alert the nurse manager the following day that I was assigned to

tasks outside my scope of duty.

Evaluating a Good Outcome: How Do I Define Success?

- The patient received safe, comprehensive care without being placed at risk.
- I performed tasks and skills within my scope of practice.
- The nurses understood my job duties and appropriately delegated the necessary tasks.
- The nurses' licensure was not put in jeopardy.
- I felt comfortable and competent in my job performance.

Personal Learning: Here's to the Future!

Since I felt uncomfortable in performing the duties assigned to me by the nurses, I confronted them and told them that I had recently been oriented to the floor and did not have experience with these skills. Although somewhat surprised that I didn't have the experience, they understood and did not want me to do anything I felt uncomfortable with. The nurses were used to having an LPN as a night aide, and the LPN's scope of practice was broader than mine. Throughout the night, I observed the nurses performing the skills and tasks, with the nurses walking me through several of the skills that I was allowed to perform but in which I did not feel proficient. In the morning, we spoke with the nurse manager, who realized the need for clarifying the job duties of the nurse's aides and the appropriate delegation of tasks. I feel that I made the right decision in speaking to the nurses because patient safety could have been compromised by my inexperience. The nurses' licensure also could have been put at risk. As a result of our conversation with the nurse manager, the orientation for new nurse's aides was reorganized, helping greatly to define the scope of duties for the aides.

Colleen Kilcullen, Georgetown University

QSEN SELF-REFLECTION ON QUALITY AND SAFETY COMPETENCIES DEVELOPING KNOWLEDGE, SKILLS, AND ATTITUDES FOR CONTINUOUS IMPROVEMENT

How do you think you would respond in a similar situation? Why? What does this tell you about yourself and about the adequacy of your skills for professional practice? How was the nursing student's action ethical? Legal? Please explain. What other *knowledge, attitudes,* and *skills* do you need to develop to continuously improve the quality and safety of care for patients like Mr. Pecorini?

Patient-Centered Care: What role did the different members of the nursing team play in creating a partnership with Mr. Pecorini to best coordinate his care? What special talents do you bring to creating this partnership?

Teamwork and Collaboration/Quality Improvement: What communication skills do you need to improve to ensure that you function as a competent, caring, and responsible member of the patient-care team and ensure that you obtain assistance when needed? How would you have responded if nursing leadership did not address your concerns? What special talents do you bring to promoting a well-functioning interdisciplinary team?

Safety/Evidence-Based Practice: What priority did Mr. Pecorini's care team accord to his health, well-being, and safety? What evidence in the nursing literature supports adhering to the scope of practice and roles?

Informatics: Can you identify the essential information that must be available in Mr. Pecorini's electronic record to support safe patient care and coordination of care? Can you think of other ways to respond to or approach the situation?

According to *Nursing: Scope and Standards of Practice* (American Nurses Association [ANA], 2021),

> "Nursing incorporates the art and science of caring and focuses on the protection, promotion, and optimization of health and abilities; prevention of illness and injury; facilitation of healing; and alleviation of suffering through compassionate presence. Nursing is the diagnosis and treatment of human response, and advocacy in the care of individuals, families, groups, communities, and populations in recognition of the connection of all humanity (p. 1)."

Nursing care involves a wide range of activities, from carrying out complicated technical procedures to something as seemingly simple as holding a hand. Nursing is a blend of science and art. The science of nursing is the knowledge base

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

for the care that is given, and the art of nursing is the skilled application of that knowledge to help others achieve maximum health and quality of life. For a contemporary description of the scope of nursing practice (the "who," "what," "where," "when," "why," and "how" of nursing practice), be sure to read the complete *Nursing: Scope and Standards of Practice* (ANA, 2021). Today, 4 million nurses in the United States practice in over 200 different specialties, such as anesthesia, mental health, school nursing, cardiac care, pediatrics, surgery, oncology, obstetrics, and geriatrics. They are caregivers, administrators, researchers, innovators, and policy makers. The federal government projects that more than 200,000 new registered nurse positions will be created each year from 2016 to 2026 (AACN, 2019). Nursing is the largest of the health professions and the foundation of the nation's health care workforce (www.nursingworld.org). Read Mancuso and Davidson (2020) "Thirty million strong: What our profession needs to look like in the upcoming decade" to learn how nurses need to lead to meet the health needs of the world.

This chapter introduces you to professional nursing, including a brief history of nursing from its beginnings to the present, and provides the definitions and aims of professional nursing. The educational preparation for professional nursing, professional nursing organizations, and guidelines for professional nursing practice are discussed to help you better understand what nursing as a profession is and how it is organized. (For an example demonstrating the importance of licensure to nursing practice and responsibilities, see the Reflective Practice box on the previous page.) This edition of the text highlights the professional formation of the nurse and importance of self-care for all nurses. Because nursing is a part of an ever-changing society, current trends in nursing also are discussed.

HISTORICAL PERSPECTIVES ON NURSING

Caregivers for the ill and injured have always been a part of history. The roles, settings, and responsibilities, however, have changed over time, as is summarized in the following section.

Development of Nursing From Early Civilizations to the 16th Century

Most early civilizations believed that illness had supernatural causes. The theory of animism attempted to explain the cause of mysterious changes in bodily functions. This theory was based on the belief that everything in nature was alive with invisible forces and endowed with power. Good spirits brought health; evil spirits brought sickness and death. In providing treatment, the roles of the health care provider and the nurse were separate and distinct. The health care provider was the medicine man who treated disease by chanting, inspiring fear, or opening the skull to release evil spirits (Dolan et al., 1983). The nurse usually was the mother who cared for her family during sickness by providing physical care and herbal remedies. This nurturing and caring role of the nurse has continued to the present.

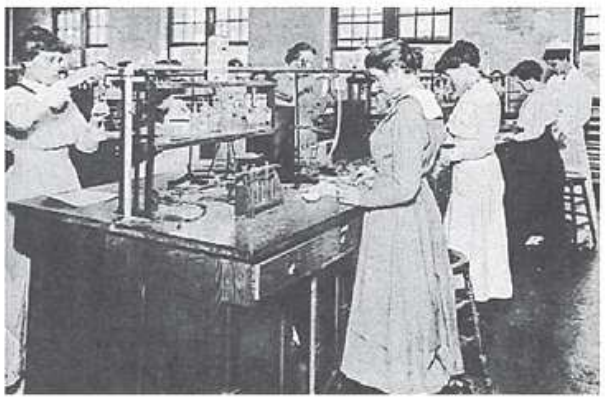
As ancient Greek civilizations grew, temples became the centers of medical care because of the belief that illness was caused by sin and the gods' displeasure (*disease* literally means "dis-ease"). During the same period, the ancient Hebrews developed rules through the Ten Commandments and the Mosaic Health Code for ethical human relationships, mental health, and disease control. Nurses cared for sick people in the home and the community and also practiced as nurse–midwives (Dolan et al., 1983).

In the early Christian period, nursing began to have a formal and more clearly defined role in society. Led by the idea that love and caring for others were important, women called "deaconesses" made the first organized visits to sick people, and members of male religious orders gave nursing care and buried the dead. Both male and female nursing orders were founded during the Crusades (11th to 13th centuries). Hospitals were built for the enormous number of pilgrims needing health care, and nursing became a respected vocation. Although the early Middle Ages ended in chaos, nursing had developed purpose, direction, and leadership.

At the beginning of the 16th century, many Western societies shifted from a religious orientation to an emphasis on warfare, exploration, and expansion of knowledge. Many monasteries and convents closed, leading to a tremendous shortage of people to care for the sick. To meet this need, women who were convicted of crimes were recruited into nursing in lieu of serving jail sentences. In addition to having a poor reputation, these nurses received low pay and worked long hours in unfavorable conditions.

Florence Nightingale and the Birth of Modern Nursing

From the middle of the 19th century to the 20th century, social reforms changed the roles of nurses and of women in general. It was during this time that nursing as we now know it began, based on many of the beliefs of Florence Nightingale. Born in 1820 to a wealthy family, she grew up in England, was well educated, and traveled extensively. Despite strong opposition from her family, Nightingale began training as a nurse at the age of 31. The outbreak of the Crimean War and a request by the British to organize nursing care for a military hospital in Turkey gave Nightingale an opportunity for achievement (Kalisch & Kalisch, 2004). As she successfully overcame enormous difficulties, Nightingale challenged prejudices against women and elevated the status of all nurses. After the war, she returned to England, where she established the first training school for nurses and wrote books about health care and nursing education. Today we celebrate Florence Nightingale as a disaster nurse, care provider, educator, manager, consultant, and statistician. Her contributions include:



Clara Barton, founder of the American Red Cross in 1882

Florence Nightingale, initiator of major reforms in health care and nursing training in England

Mary Mahoney, America's first African American nurse to graduate from a school of nursing

Vassar training camp classroom, 1918

Isabel Hampton Robb, outstanding leader in nursing and nursing education

Philadelphia General Hospital nurse, late 1800s

Post-WWII nursing school poster

FIGURE 1-1. Images of nurses spanning more than 100 years of service. (Courtesy of the Center for the Study of the History of Nursing, University of Pennsylvania.)

- Identifying the personal needs of the patient and the role of the nurse in meeting those needs
- Establishing standards for hospital management
- Establishing a respected occupation for women
- Establishing nursing education
- Recognizing the two components of nursing: health and illness
- Believing that nursing is separate and distinct from medicine
- Recognizing that nutrition is important to health
- Instituting occupational and recreational therapy for sick people
- Stressing the need for continuing education for nurses
- Maintaining accurate records, recognized as the beginnings of nursing research

Florence Nightingale, other historically important nurses, and images of early nursing can be seen in Figure 1-1. Figure 1-2 illustrates "monumental moments" in nursing. People important to the early development of nursing are listed in Table 1-1 (on page 10). See Chapter 10 for a list of contemporary nurse leaders. A historical overview of the foundational documents for nursing is presented in Box 1-1. You may also want to check the WHO's *State of the world's nursing 2020* report, which provides the latest, most up-to-date evidence on policy options for the global nursing workforce. It presents a compelling case for considerable yet feasible investment in nursing education, jobs, and leadership (https://www.who.int/publications/i/item/9789240003279).

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

1836
While recuperating in a British hospital, **Dorothea Dix** met prison reformers and mental health professionals who inspired her later work as an advocate for the humane treatment of the mentally ill. She founded or expanded more than **30** hospitals for mentally ill patients during her lifetime.

1860
Considered the founder of modern nursing, **Florence Nightingale** established the first secular nursing school in London. She was integral to elevating nursing training and the nursing profession. (See page 6 for a full timeline of her life.).

1862
Walt Whitman became a nurse after his brother was wounded during the Battle of Fredericksburg. His brother recovered, and Whitman went on to care for wounded soldiers throughout the Civil War. Many of his experiences at field hospitals were reflected in his poetry and prose.

1879
Mary Eliza Mahoney became the first Black female nurse in the United States. Throughout her 40-year career, Mahoney faced extreme discrimination, but she paved the way for other Black women in the field of nursing. Mahoney was inducted into the **National Women's Hall of Fame in 1993.**

1881
Clara Barton, a self-taught nurse who served on battlefields during the Civil War, established the **American Red Cross.**

1900
The first issue of the **American Journal of Nursing** was distributed.

1911
The American Nurses Association (ANA) was formally established. While the organization officially began in 1896, its name was changed in 1911, and it began representing nurses throughout the country.

1923
Yale Nursing School was founded, becoming the first independent nursing school in the United States. The school was unique among colleges and universities at that time because it accepted women.

1934
ANA's House of Delegates approved an **eight-hour day** for nurses and conducted a national campaign to promote better working hours.

1940
There were **369,287** nurses in the U.S., according to the U.S. Census. That included **361,215 women** and **8,072 men.**

1945
ANA intensified efforts to **recruit nurses** for military service as an alternative to President Roosevelt's proposal to draft nurses into military services.

1962
By the end of 1962, all state nurses associations accepted all qualified registered nurses (RNs) into membership, **regardless of race, color or creed.**

1964
ANA's House of Delegates approved a recommendation for making the **baccalaureate degree** the educational foundation for professional nursing.

1964
Congress passed the **Nurse Training Act,** the most comprehensive nursing legislation in American history. The act reflected the federal government's enlarged financial commitment to nursing education.

1974
The first hospice program was created in the United States by **Florence Wald,** who believed that individuals with incurable diseases should focus on connecting with their families instead of enduring endless treatments.

1982
The American Academy of Nursing identified **41** hospitals as **Magnet Hospitals.** Magnet Hospitals are workplaces that follow models of nursing practice and provide positive working environments for nurses.

1986
The National Institute of Nursing Research was established at the National Institutes of Health to support and conduct clinical and basic research on issues of health and illness across the lifespan.

1988
ANA promoted the use of nurses to plan and implement **psychological** and **psychosocial** nursing care for clients with AIDS-related health problems.

1988
The estimated number of RNs in the U.S. was **2,033,032**, and of those, **1,627,032** were employed in nursing, according to ANA.

1992
Eddie Bernice Johnson became the first RN elected to the United States Congress.

1993
The ANA Board of Directors designated **May 6 - 12** as permanent dates to observe National Nurses Week.

1995
ANA supported the **Fair Pay Act** to require employers to provide equal pay for jobs of comparable skill, effort, responsibility and working conditions.

2000
The National Sample Survey of Registered Nurses estimated there were **2,696,540** RNs in the U.S.

2008
There were an estimated **3,063,162** licensed RNs living in the United States, as of March 2008, according to a report from the U.S. Department of Health and Human Services.

2018
$71,730: the annual median salary for RNs, according to the U.S. Bureau of Labor Statistics.

2020
In celebration of the 200th anniversary of Florence Nightingale's birth, the World Health Organization designated 2020 as the **International Year of the Nurse and the Midwife.**

2020
The Washington Post partnered with ANA to present **Star Nurses,** a premiere event that recognized leading nurses in the Greater Washington area and named six Nightingale Award winners, on September 1, 2020.

2020
4 million: The Nation's RN population, according to ANA.

2020
Since the **global outbreak of covid-19**, ANA has advocated for clear, evidence-based guidelines and resources to keep RNs and health-care workers safe, so that they can effectively protect the public.

FIGURE 1-2. Monumental moments in nursing. (Used with permission, Star Nurses publication from *The Washington Post*.)

Table 1-1 People Important to the Early Development of Nursing in North America

PERSON	CONTRIBUTION
19th Century	
Florence Nightingale	Defined nursing as both an art and a science, differentiated nursing from medicine, created freestanding nursing education; published books about nursing and health care; is regarded as the founder of modern nursing (see text for further information)
Clara Barton	Volunteered to care for wounds and feed Union soldiers during the Civil

	War; served as the supervisor of nurses for the Army of the James, organizing hospitals and nurses; established the Red Cross in the United States in 1882
Dorothea Dix	Served as superintendent of the Female Nurses of the Army during the Civil War; was given the authority and the responsibility for recruiting and equipping a corps of army nurses; was a pioneering crusader for the reform of the treatment of the mentally ill
Mary Ann Bickerdyke	Organized diet kitchens, laundries, and an ambulance service, and supervised nursing staff during the Civil War
Louise Schuyler	A nurse during the Civil War; returned to New York and organized the New York Charities Aid Association to improve care of the sick in Bellevue Hospital; recommended standards for nursing education
Linda Richards	Graduated in 1873 from the New England Hospital for Women and Children in Boston, Massachusetts, as the first trained nurse in the United States; became the night superintendent of Bellevue Hospital in 1874 and began the practice of keeping records and writing orders
Jane Addams	Provided social services within a neighborhood setting; a leader for women's rights; recipient of the 1931 Nobel Peace prize
Lillian Wald	Established a neighborhood nursing service for the sick poor of the Lower East Side in New York City; the founder of public health nursing
Mary Elizabeth Mahoney	Graduated from the New England Hospital for Women and Children in 1879 as America's first Black nurse
Harriet Tubman	A nurse and an abolitionist; active in the underground railroad movement before joining the Union Army during the Civil War
Nora Gertrude Livingston	Established a training program for nurses at the Montreal General Hospital (the first 3-year program in North America)
Mary Agnes Snively	Director of the nursing school at Toronto General Hospital and one of the founders of the Canadian Nurses Association
Sojourner Truth	Provided nursing care to soldiers during the Civil War and worked for the women's movement
Isabel Hampton Robb	A leader in nursing and nursing education; organized the nursing school at Johns Hopkins Hospital; initiated policies that included limiting the number of hours in a day's work and wrote a textbook to help student learning; the first president of the Nurses Associated Alumnae of the United States and Canada (which later became the American Nurses Association)
20th Century	
Mary Adelaide Nutting	Became the first professor of nursing in the world as a faculty member of Teachers' College, Columbia University; with Lavinia Dock, published the four-volume *History of Nursing*
Elizabeth Smellie	A member of the original Victorian Order of Nurses for Canada (a group that provided public health nursing); organized the Canadian Women's Army Corps during World War II
Lavinia Dock	A nursing leader and women's rights activist; instrumental in the Constitutional amendment giving women the right to vote
Mary Breckenridge	Established the Frontier Nursing Service and one of the first midwifery schools in the United States

Box 1-1 **Timeline of the Development of Foundational Nursing Documents**

1859	Florence Nightingale publishes Notes on Nursing: What It Is and What It Is Not.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

1896	The Nurses' Associated Alumnae of the United States and Canada is founded. Later to become the American Nurses Association (ANA), its first purpose is to establish and maintain a code of ethics.
1940	A "Tentative Code" is published in the *American Journal of Nursing,* although never formally adopted.
1950	*Code for Professional Nurses,* in the form of 17 provisions that are a substantive revision of the "Tentative Code" of 1940, is unanimously accepted by the ANA House of Delegates.
1952	*Nursing Research* publishes its premiere issue.
1956	*Code for Professional Nurses* is amended.
1960	*Code for Professional Nurses* is revised.
1968	*Code for Professional Nurses* is substantively revised, condensing the 17 provisions of the code into 10 provisions.
1973	ANA publishes its first *Standards of Nursing Practice*.
1976	*Code for Nurses with Interpretive Statements,* a modification of the provision and interpretive statements, is published as 11 provisions.
1980	ANA publishes *Nursing: A Social Policy Statement*.
1985	The National Institutes of Health organizes the Center for Nursing Research. ANA publishes *Titling for Licensure*. *Code for Nurses with Interpretive Statements* retains the provisions of the 1976 version and includes revised interpretive statements. The ANA House of Delegates forms a task force to formally document the scope of practice for nursing.
1987	ANA publishes *The Scope of Nursing Practice*.
1990	The ANA House of Delegates forms a task force to revise the 1973 *Standards of Nursing Practice.*

Development of Nursing From the 19th to 21st Centuries

Both the work of Florence Nightingale and the care provided for battle casualties during the Civil War focused attention on the need for educated nurses in the United States. Schools of nursing, founded in connection with hospitals, were established on the beliefs of Nightingale, but the training they provided was based more on apprenticeship than on educational principles. Hospitals saw an economic advantage in having their own schools, and most hospital schools were organized to provide more easily controlled and less expensive staff for the hospital. This resulted in a lack of clear guidelines separating nursing service and nursing education. As students and as graduates, female nurses were under the control of male hospital administrators and health care providers. The lack of educational standards, the male dominance in health care, and the pervading Victorian belief that women were subordinate to men combined to contribute to several decades of slow progress toward professionalism in nursing (Kalisch & Kalisch, 2004).

World War II had an enormous effect on nursing. For the first time, as large numbers of women worked outside the home, they became more independent and assertive. These changes in women and in society led to an increased emphasis on education. The war itself had created a need for more nurses and resulted in a knowledge explosion in medicine and technology, which broadened the role of nurses. After World War II, efforts were directed at upgrading nursing education. Schools of nursing were based on educational objectives and were increasingly developed in university and college settings, leading to degrees in nursing for men, women, and minorities.

Nursing achievement has broadened in all areas, including practice in a wide variety of health care settings, the development of a specific body of knowledge, the conduct and publication of nursing research, and the recognition of the role of nursing in promoting access to affordable quality health care. Increased emphasis on nursing knowledge as the foundation for evidence-based practice (EBP) has led to the growth of nursing as a professional discipline. The American Association of Colleges of Nursing (AACN, 2019) is careful to point out that, although often working collaboratively, nursing does not "assist" medicine or other fields. Nursing operates independently of, not auxiliary to, medicine and other disciplines. Nurses' roles range from direct patient care and case management to establishing nursing practice standards, developing quality assurance procedures, and directing complex nursing care systems.

In the 2021 *The Essentials: Core Competencies for Professional Nursing Education* document, the AACN proposes a vision for the future of the nursing workforce, including ways educators can help graduates to be "work ready":

> Nursing education for the 21st century ought to reflect a number of contemporary trends and values and address several issues to shape the future workforce, including diversity, equity, and inclusion [see Chapter 3]; four spheres of care (including an enhanced focus on primary care); systems-based practice; informatics and technology [see Chapter 21]; academic partnerships; and career-long learning. (p. 5)

You will want to read this document carefully as you prepare for your career in today's professional nursing.

Noting that, historically, nursing education emphasized clinical education in acute care, authors of the *Essentials* document emphasized that the future of health care delivery will occur within four spheres of care: (1) disease prevention/promotion of health and well-being, which includes the promotion of physical and mental health in all patients as well as management of minor-acute and intermittent care needs of generally healthy patients; (2) chronic disease care, which includes management of chronic diseases and prevention of sequelae; (3) regenerative or restorative care, which includes critical/trauma care, complex acute care, acute exacerbations of chronic conditions, and treatment of physiologically unstable patients that generally requires care in a mega-acute institution; and (4) hospice/palliative/supportive care, which includes end-of-life care as well as palliative and supportive care for individuals requiring extended care, those with complex, chronic disease states, or those requiring rehabilitative care (2021, p. 6). See Box 1-2.

Box 1-2 Four Spheres of Nursing Care

Wellness, Disease Prevention	Promotion of physical and mental health in all patients as well as management of minor-acute and intermittent care needs of generally healthy patient
Chronic Disease Management	Management of chronic diseases and prevention of sequelae
Regenerative/Restorative Care	Critical/trauma care, complex acute care, acute exacerbations of chronic conditions, and treatment of physiologically unstable patients that generally requires care in a mega-acute institution
Hospice/Palliative Care	Includes end-of-life care as well as palliative and supportive care for individuals requiring extended care, those with complex, chronic disease states, or those requiring rehabilitative care

To learn more about the history of nursing, visit the Penn Nursing Science Nursing, History, and Health Care website: https://www.nursing.upenn.edu/nhhc.

DEFINITIONS OF NURSING

The word *nurse* originated from the Latin word *nutrix,* meaning "to nourish." Most definitions of **nursing** describe the nurse as a person who nourishes, fosters, and protects and who is prepared to take care of sick, injured, older, and dying people. With the expanding roles and functions of the nurse in today's society, however, any one definition may be too limited.

The International Council of Nurses (ICN) captures much of what nursing means in its definition:

> Nursing encompasses autonomous and collaborative care of individuals of all ages, families, groups, and communities, sick or well and in all settings. Nursing includes the promotion of health, prevention of illness, and the care of ill, disabled, and dying people. Advocacy, promotion of a safe environment, research, participation in shaping health policy and in patient and health systems management, and education are also key nursing roles.

In addition to the definition of nursing shared at the beginning of the chapter, the ANA describes the social context of nursing, the knowledge base for nursing practice, the scope of nursing practice, standards of professional nursing practice, and the regulation of professional nursing in its *Nursing's Social Policy Statement* (2010). Within today's definitions of nursing, we find all the elements of professional nursing. Nurses focus on human experiences and responses to birth, health, illness, and death within the context of people, families, groups, and communities. The knowledge base for nursing practice includes diagnosis, interventions, and evaluation of outcomes from an established care plan. In addition, the nurse integrates objective data with knowledge gained from an understanding of the patient's or group's subjective experience, applies scientific knowledge in the nursing process and other clinical judgment models, and provides a caring relationship that facilitates health and healing.

Table 1-2 Nursing Roles in All Settings

ROLE	FUNCTION
Caregiver	The provision of care to patients that combines both the art and the science of nursing in meeting physical, emotional, intellectual, sociocultural, and spiritual needs. As a caregiver, the nurse integrates the roles of communicator, teacher, counselor, leader, researcher, advocate, and collaborator to promote wellness through activities that prevent illness, restore health, and facilitate coping with disability or death. The role of caregiver is the primary role of the nurse.
Communicator	The use of effective interpersonal and therapeutic communication skills to establish and maintain helping relationships with patients of all ages in a wide variety of health care settings
Teacher/educator	The use of communication skills to assess, implement, and evaluate individualized teaching plans to meet learning needs of patients and their families
Counselor	The use of therapeutic interpersonal communication skills to provide information, make appropriate referrals, and facilitate the patient's problem-solving and decision-making skills
Leader	The assertive, self-confident practice of nursing when providing care, effecting change, and functioning with groups
Researcher	The participation in or conduct of research to increase knowledge in nursing and improve patient care
Advocate	The protection of human or legal rights and the securing of care for all patients based on the belief that patients have the right to make informed decisions about their own health and lives
Collaborator	The effective use of skills in organization, communication, and advocacy to facilitate the functions of all members of the health

care team as they provide patient care

The central focus in all definitions of nursing is the patient (the person receiving care), which includes the physical, emotional, social, and spiritual dimensions of that person. Nursing is no longer considered to be concerned primarily with illness care. Nursing's concepts and definitions have expanded to include the prevention of illness; the promotion and maintenance of health for people, families, groups, and communities; and care for seriously ill and dying people.

NURSING'S AIMS AND COMPETENCIES

Four broad aims of nursing practice can be identified in the definitions of nursing:

. To promote health
. To prevent illness
. To restore health
. To facilitate coping with disability or death

To meet these aims, the nurse uses four blended competencies: cognitive, technical, interpersonal, and ethical/legal. More recently these competencies have been further specified as the Quality and Safety Education for Nurses (QSEN) project competencies: patient-centered care, teamwork and collaboration, quality improvement, safety, EBP, and informatics (Sherwood & Barnsteiner, 2012). These competencies are described in Chapter 13. The Reflective Practice Boxes that begin each chapter of this book offer examples of practical challenges to these competencies that actual nursing students have encountered.

The primary role of the nurse as caregiver is given shape and substance by the interrelated roles of communicator, teacher, counselor, leader, researcher, advocate, and collaborator. These roles are described in Table 1-2 and throughout the text. You will also discover that nurses play many specialized roles in today's evolving health care environment, such as case manager, navigator, informaticist, safety and quality officer, ethicist, to name just a few. As you progress through your clinical rotations, pay attention to the many diverse roles nurses play and begin to reflect on what might be the perfect fit for you. Nurses carry out their roles in many different settings, with care increasingly provided in the home and in the community. Examples of settings for care are fully described in Unit II.

Recall **Roberto Pecorini**, the 38-year-old patient with metastatic cancer. When providing care for Mr. Pecorini, the nurse assumes the role of competent, caring, and responsible caregiver, creates a respectful partnership while identifying best practices, maintains the patient's safety throughout, and appropriately educates the patient and advocates for the patient's rights.

Promoting Health

Health is a state of optimal functioning or well-being. As defined by the WHO, a person's health includes physical, social, and mental components and is not merely the absence of disease or infirmity. Health is often a subjective state: people medically diagnosed with an illness may still consider themselves healthy. Wellness, a term that is often associated with health, is an active state of being healthy by living a lifestyle that promotes good physical, mental, emotional, and spiritual health. Models of health and wellness are described in Chapter 3.

Health is an essential part of each of the other aims of nursing. Nurses promote health by identifying, analyzing, and maximizing each patient's own individual strengths as components of preventing illness, restoring health, and facilitating coping with disability or death.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

When teaching **Mr. Basshir**, the patient described at the beginning of the chapter with risk factors for heart disease, the nurse would focus the teaching plan to rely on the patient's strengths. Although his statements reflect a reluctance to learn and change, emphasizing the patient's strengths would help the patient feel more in control of his health, and thus, hopefully, spur him to make the necessary changes.

Health promotion is motivated by the desire to increase a person's well-being and health potential. A person's level of health is affected by many different interrelated factors that either promote health or increase the risk for illness. These factors include genetic inheritance, cognitive abilities, educational level, race and ethnicity, culture, age and biologic sex, developmental level, lifestyle, environment, and socioeconomic status. A level of health or wellness is also strongly influenced by what is termed "health literacy." Health literacy is the ability of people to obtain, process, and understand the basic information needed to make appropriate decisions about health. Examples of ways that nurses can promote health literacy are included throughout this text.

Healthy People 2030 also establishes health promotion guidelines for the nation as a whole. The guidelines are focused on meeting five overarching goals:

. Attain healthy, thriving lives and well-being, free of preventable disease, disability, injury, and premature death.
. Eliminate health disparities, achieve health equity, and attain health literacy to improve the health and well-being of all.
. Create social, physical, and economic environments that promote attaining full potential for health and well-being for all.
. Promote healthy development, healthy behaviors, and well-being across all life stages.
. Engage leadership, key constituents, and the public across multiple sectors to take action and design policies that improve the health and well-being of all.

Box 1-3 lists the foundational principles that explain the thinking that guides decisions about Healthy People 2030.

Patient-centered health promotion is the framework for nursing activities. The nurse considers the patient's self-awareness, health awareness, and use of resources while providing care. Through knowledge and skill, the nurse:

- Facilitates patients' decisions about lifestyle that enhance the quality of life and encourage acceptance of responsibility for their own health

Box 1-3 Healthy People 2030: Foundational Principles

- Health and well-being of all people and communities are essential to a thriving, equitable society.
- Promoting health and well-being and preventing disease are linked efforts that encompass physical, mental, and social health dimensions.
- Investing to achieve the full potential for health and well-being for all provides valuable benefits to society.
- Achieving health and well-being requires eliminating health disparities, achieving health equity, and attaining health literacy.
- Healthy physical, social, and economic environments strengthen the potential to achieve health and well-being.
- Promoting and achieving the Nation's health and well-being is a shared responsibility that is distributed across the national, state, tribal, and community levels, including the public, private, and not-for-profit sectors.
- Working to attain the full potential for health and well-being of the population is a component of decision making and policy formulation across all sectors.

Source: Office of Disease Prevention and Health Promotion. *Healthy People 2030 Framework*. https://www.healthypeople.gov/2020/About-Healthy-People/Development-Healthy-People-2030/Framework.

- Increases patients' health awareness by assisting in the understanding that health is more than just not being ill, and by teaching that certain behaviors and factors can contribute to or diminish health
- Teaches self-care activities to maximize achievement of goals that are realistic and attainable
- Serves as a role model

- Encourages health promotion by providing information and referrals

Recall **Michelle Fine**, the young mother with a new baby who calls the nursery for help with breastfeeding. Making a referral for home care follow-up before Michelle's discharge from the hospital would have been an appropriate intervention to offer support, guidance, and additional teaching.

Preventing Illness

The U.S. Department of Health and Human Services Office of Disease Prevention and Health Promotion (ODPHP) leads efforts to improve the health of all Americans. The objectives of disease prevention activities are to reduce the risk of illness, to promote good health habits, and to maintain optimal functioning. Nurses prevent illness primarily by teaching and by personal example. Examples include:

- Educational programs in areas such as prenatal care for pregnant people, smoking-cessation programs, and stress-reduction seminars
- Community programs and resources that encourage healthy lifestyles, such as aerobic exercise classes, "swimnastics," and physical fitness programs
- Literature, television, radio, or Internet information on a healthy diet, regular exercise, and the importance of good health habits
- Health assessments in institutions, clinics, and community settings that identify areas of strength and risks for illness

As you think back to the early days of the COVID-19 pandemic in 2020 and the critical importance of frequent handwashing, social distancing, and wearing masks, what efforts did you take to model appropriate behaviors? When we learned in the summer of 2020 that if 95% of Americans wore masks in public we could prevent 33,000 deaths by October 1, 2020, it was hard to understand why so many still refused to wear masks (http://www.healthdata.org/news-release/new-ihme-covid-19-model-projects-nearly-180000-us-deaths). At 4 million strong, U.S. nurses have the potential to be a real powerhouse if we each reach out in our personal spheres of influence to encourage healthy behaviors.

Take time to check out Health.gov, the ODPHP's website (https://health.gov) to familiarize yourself with many helpful resources that you can use for yourself, your family, and your patients.

Think back to **Ahmad Basshir**, the 62-year-old man at risk for heart disease who was described at the beginning of the chapter. By addressing Mr. Basshir's resistance to change and teaching him the lifestyle modifications necessary to reduce his risk for developing heart disease, the nurse contributes to illness prevention by promoting healthier behavior.

Restoring Health

Activities to restore health encompass those historically considered to be the nurse's responsibility. These focus on the person with an illness and range from early detection of a disease to rehabilitation and teaching during recovery. Such activities include:

- Performing assessments that detect an illness (e.g., taking blood pressure, measuring blood sugars)
- Referring questions and abnormal findings to other health care providers as appropriate
- Providing direct care of the person who is ill by such measures as giving physical care, administering medications, and carrying out procedures and treatments
- Collaborating with other health care providers in providing care
- Planning, teaching, and carrying out rehabilitation for illnesses such as heart attacks, arthritis, and strokes

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

- Working in mental health and chemical-dependency programs

Facilitating Coping With Disability and Death

Although the major goals of health care are promoting, maintaining, and restoring health, these goals cannot always be met. Nurses also facilitate patient and family coping with altered function, life crisis, and death. Altered function decreases a person's ability to carry out activities of daily living (ADLs) and expected roles. Nurses facilitate an optimal level of function through maximizing the person's strengths and potentials, through teaching, and through referral to community support systems. Nurses provide care to both patients and families at the end of life, and they do so in hospitals, long-term care facilities, hospices, and homes. Nurses are active in hospice programs, which assist patients and their families in multiple settings in preparing for death and in living as comfortably as possible until death occurs.

NURSING AS A PROFESSIONAL DISCIPLINE

As definitions of nursing have expanded to describe more clearly the evolving roles and actions of nurses, increased attention has been given to nursing as a professional discipline. Nursing uses existing and new knowledge to solve problems creatively and meet human needs within ever-changing boundaries. Nursing is recognized as a **profession** based on the following defining criteria:

- Well-defined body of specific and unique knowledge
- Strong service orientation
- Recognized authority by a professional group
- Code of ethics
- Professional organization that sets standards
- Ongoing research
- Autonomy and self-regulation

Nursing involves specialized skills and application of knowledge based on an education that has both theoretical and clinical practice components. Nursing is guided by standards set by professional organizations and an established code of ethics. Nursing focuses on human responses to actual or potential health problems and is increasingly focused on wellness, an area of caring that encompasses nursing's unique knowledge and abilities. Nursing is increasingly recognized as scholarly, with academic qualifications, research, and publications specific to the profession that are widely accepted and respected. In addition, nursing interventions are focused on EBP, which is practice based on research and not intuition.

Nursing has evolved through history from a technical service to a thoughtful, person-centered process that maximizes potential in all human dimensions. This has been an active development process, using lessons from the past to gain knowledge for practice in the present and in the future.

PROFESSIONAL FORMATION

If nursing is a profession and not merely a job, nurse educators have a responsibility to form the professional identities of their students and graduates. You should be learning from every faculty member in every class and clinical encounter, not only how to *do* nursing but how to *be* a nurse. Maureen Shawn Kennedy (2018), editor of the *American Journal of Nursing*, charged nurse educators to transform nursing students into nurses who have a sense of themselves that is influenced by the characteristics, norms, and values of the nursing discipline, resulting in each individual thinking, acting, and feeling like a nurse. See Box 1-4.

If we educators are successful, you will graduate with a professional identity that creates a sense of belonging to a group that holds the same values. You will practice with respected colleagues with whom you can touch base when you need to make tough decisions in stressful situations. Most importantly, those who experience your care will know that they are being cared for in a professional manner by someone who adheres to a code of ethical conduct. The authors of this text take Kennedy's charge seriously, and, in every chapter, we aim to forge your professional identity and suggest not only how to do nursing but also how to be a nurse. Our goal is to help you become a competent, compassionate, responsible professional who can be trusted to be who the public you serve needs.

Box 1-4 Tips for Thinking, Acting, and Feeling Like a Nurse

Think like a nurse,

- Make sure that solid research/nursing science informs every aspect of your evidence-based practice.
- Always be prepared to answer the question, "Why are you doing it this way?"
- Value being able to think strategically and creatively about the plan of care for patients with complex needs.
- Ask yourself, if this was the person you loved most, "would I be happy about the care being delivered?"

- Be intellectually humble and never fail to ask for help when you are unsure of what counts as a best response.

Act like a nurse,

- Demonstrate over and over again that your primary concern is the patient, family, and community you serve.
- Prioritize patient safety and high-quality care.
- Inspire confidence and trust in your being a competent, compassionate, and responsible nurse.
- Learn how to advocate effectively for anyone not receiving optimal care or for colleagues being disrespected in the workplace.
- Create a culture that supports everyone's doing the right thing simply because it's the right thing to do.
- Live a healthy life so that you can be energized for each day's practice.

Feel like a nurse.

- Take deserved pride and joy in being the critical difference that makes health care "work" for even, or especially for, the most vulnerable.
- Renew your ability to empathize with patients, families, and communities in need and to respond compassionately; take a break when compassion fatigue or burnout threatens your care.
- Practice self-compassion when your best efforts fail to resolve patient problems or challenging practice situations.
- Recognize moral distress and seek help in responding.
- Value your growing resilience even in times of crisis … delight in the positive energy and strength you bring to your team.

EDUCATIONAL PREPARATION FOR NURSING PRACTICE

Educational preparation for nursing practice involves several different types of programs that lead to **licensure**, or the legal authority to practice as a nursing professional. Students may choose to enter a practical nursing program and become a licensed practical nurse (LPN) or they may enter a diploma, an associate degree, or a baccalaureate program to be licensed as a registered nurse (RN). State laws in the United States recognize both the LPN and the RN as credentials to practice nursing. Increasingly, various levels of nursing education are providing programs for educational advancement. For example, the LPN can complete an associate degree and become an RN, and the RN prepared at the diploma or associate degree level can attain a bachelor of science in nursing (BSN) degree. There are also programs that provide RN-to-master's degrees, as well as BSN-to-DNP or PhD, and master's degree-to-DNP or PhD. Graduate programs in nursing provide master's and doctoral degrees. For a guide to the many different types of nursing programs, read "Professional Registered Nurses Today: The Who of Nursing" (ANA, 2021) and check out the AACN website (https://www.aacnnursing.org/).

Educational preparation for the nurse has become a major issue in nursing; the multiple methods of preparation are confusing to employers, consumers of health care services, and nurses themselves. Nursing organizations are working hard to answer questions such as "What is technical nursing?" and "What is professional nursing?" as well as "Should graduates of different programs take the same licensing examination and have the same title?" These questions are likely to be resolved during your nursing career. The AACN believes that baccalaureate education should be the minimum level required for entry into professional nursing practice in today's complex health care environment. Most RNs today enter practice with a baccalaureate degree offered by a 4-year college or university or an associate degree offered by a community college. Employers are expressing a strong preference for new nurses with baccalaureate preparation. Findings from the AACN's latest survey on the Employment of New Nurse Graduates show that 46% of employers require new hires to have a bachelor's degree, while 88% strongly prefer baccalaureate-prepared nurses (AACN Nursing Fact Sheet).

The AACN's Essentials notes that nursing has been identified as having the potential for making the biggest impact on a transformation of health care delivery to a safer, higher quality, and more cost-effective system (AACN, 2008, 2021). The 2021 Essentials document describes the outcomes expected of graduates of baccalaureate programs and emphasizes ten domains: Knowledge for Nursing Practice, Person Centered Care, Population Health, Scholarship for the Nursing Discipline, Quality and Safety, Interprofessional Partnerships, Systems Based Practice, Informatics and Healthcare Technologies, Professionalism, and Personal, Professional, and Leadership Development. In addition to domains, there are featured concepts associated with professional nursing practice that are integrated within the Essentials. These include clinical judgment, communication, compassionate care, diversity, equity and inclusion, ethics, evidence-based practice, health policy, and social determinants of health.

The following sections discuss current education for LPNs and RNs as well as graduate nursing education, continuing education for nurses, and in-service education.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Practical and Vocational Nursing Education

Practical (also labeled vocational) nursing programs were established to teach graduates to give bedside nursing care to patients. Schools for practical nursing programs are located in varied settings, such as high schools, technical or vocational schools, community colleges, and independent facilities. Most programs are 1 year in length, divided into one third classroom hours and two thirds clinical laboratory hours. On completion of the program, graduates can take the National Council Licensure Examination–Practical Nurse (NCLEX–PN) for licensure as an LPN. LPNs work under the direction of a health care provider or RN to give direct care to patients, focusing on meeting health care needs in hospitals, long-term care facilities, and home health facilities.

Registered Nursing Education

Three types of educational programs traditionally lead to licensure as an RN: (1) diploma, (2) associate degree, and (3) baccalaureate programs. Graduates of all three programs take the NCLEX–RN examination. Although it is a national examination, it is administered by—and the nurse is licensed in—the state in which the examination is taken and passed. *It is illegal to practice nursing unless one has a license verifying completion of an accredited (by state) program in nursing and has passed the licensing examination.* Nurses gain legal rights to practice nursing in another state by applying to that state's board of nursing and receiving reciprocal licensure. Read more in Chapter 7.

The U.S. Department of Labor, Bureau of Labor Statistics (BLS), annually collects and publishes data on employment and earnings for more than 800 occupations. As of 2020, the BLS reports that employment of registered nurses is projected to grow 12% from 2018 to 2028, much faster than the average for all occupations. Reasons for this accelerated growth include an increased emphasis on preventive care, increasing rates of chronic conditions, and demand for health care services from the baby boomer generation as members of this group lead longer and more active lives.

Diploma in Nursing

Many nurses practicing in the United States today received their basic nursing education in a 3-year, hospital-based diploma school of nursing. The first schools of nursing established to educate nurses were diploma programs; until the 1960s, they were the major source of graduates. In recent years, the number of diploma programs has decreased greatly.

Graduates of diploma programs have a sound foundation in the biologic and social sciences, with a strong emphasis on clinical experience in direct patient care. Graduates work in acute, long-term, and ambulatory health care facilities.

Associate Degree in Nursing

Most associate degree in nursing (ADN) programs are offered by community or junior colleges. These 2-year educational programs often attract students with more diverse backgrounds than do the other types of programs. Associate degree education prepares nurses to give care to patients in various settings, including hospitals, long-term care facilities, and home health care and other community settings. Graduates are technically skilled and well prepared to carry out nursing roles and functions. As defined by the National League for Nursing (NLN), competencies of the ADN on entry into practice encompass the roles of provider of care, manager of care, and member of the discipline of nursing.

Baccalaureate in Nursing

The first baccalaureate nursing programs were established in the United States in the early 1900s. The number of programs and the number of enrolling students, however, did not increase markedly until the 1960s. Most graduates receive a BSN.

Recommendations by national nursing organizations that the entry level for professional practice be at the baccalaureate level have resulted in increased numbers of these programs. Although BSN nurses practice in a wide variety of settings, the 4-year degree is required for many administrative, managerial, and community health positions.

In BSN programs, the major in nursing is built on a general education base, with concentration on nursing at the upper level. Students acquire knowledge of theory and practice related to nursing and other disciplines, provide nursing care to individuals and groups, work with members of the health care team, use research to improve practice, and have a foundation for graduate study. Nurses who graduate from a diploma or associate degree program and wish to complete requirements for a BSN may choose to enroll in an on-campus, online, or external degree RN-to-BSN program. In addition, there are accelerated BSN programs for people who already have a degree in another area.

Table 1-3 Expanded Educational and Career Roles of Nurses

TITLE	DESCRIPTION
Clinical nurse specialist	
Examples: enterostomal therapist, geriatrics, infection control, medical-	A nurse with an advanced degree, education, or experience who is considered to be an expert in a specialized area of nursing; carries out direct patient care; consultation; teaching of patients, families, and staff;

surgical, maternal–child, oncology, quality assurance, nursing process	and research
Nurse practitioner	A nurse with an advanced degree, certified for a special area or age of patient care; works in a variety of health care settings or in independent practice to make health assessments and deliver primary care
Nurse anesthetist	A nurse who completes a course of study in an anesthesia school; carries out preoperative visits and assessments; administers and monitors anesthesia during surgery; and evaluates postoperative status of patients
Nurse–midwife	A nurse who completes a program in midwifery; provides prenatal and postnatal care; and delivers babies for patients with uncomplicated pregnancies
Clinical nurse leader	A nurse prepared at the graduate level who oversees the lateral integration of care for a distinct group of patients and who may actively provide direct patient care in complex situations. The CNL role is not one of administration or management.
Nurse educator	A nurse, usually with an advanced degree, who teaches in educational or clinical settings; teaches theoretical knowledge and clinical skills; conducts research
Nurse administrator	A nurse who functions at various levels of management in health care settings; is responsible for the management and administration of resources and personnel involved in giving patient care
Nurse researcher	A nurse with an advanced degree who conducts research relevant to the definition and improvement of nursing practice and education
Nurse entrepreneur	A nurse, usually with an advanced degree, who may manage a clinic or health-related business, conduct research, provide education, or serve as an adviser or consultant to institutions, political facilities, or businesses

Emerging Entry Points

Beyond the mainstream entry routes to a career as an RN, a number of additional pathways are emerging and proving effective at attracting new audiences into the nursing profession. These alternative routes include entry-level master's programs, accelerated programs for graduates of nonnursing disciplines, community college–based baccalaureate programs, and RN completion programs for LPNs and other allied health providers.

Graduate Education in Nursing

The two levels of graduate education in nursing are the master's and doctoral degrees. A master's degree prepares advanced practice nurses (APRNs) to function in educational settings, in managerial roles, as clinical specialists, and in various advanced practice areas, such as nurse–midwives and nurse practitioners (Table 1-3). Many master's graduates gain national certification in their specialty area—for example, as family nurse practitioners (FNPs) or nurse midwives. The clinical nurse leader (CNL) is an emerging nursing role developed by the AACN (2012) in collaboration with an array of leaders from the practice environment. The CNL, an advanced clinician with education at the master's degree level, puts EBP into action to ensure that patients benefit from the latest innovations in care delivery. The CNL role is not one of administration or management. Nurses with doctoral degrees meet requirements for academic advancement and organizational management. They also are prepared to carry out research necessary to advance nursing theory and practice.

The newest graduate nursing degree is the doctor of nursing practice (DNP). In 2004, the AACN, in consultation with a variety of stakeholder groups, called for moving the current level of preparation necessary for advanced practice from the master's degree to the DNP by the year 2015. According to their position statement, the DNP is designed for nurses seeking a terminal degree in nursing practice and offers an alternative approach to research-focused doctoral programs. DNP-prepared nurses are well equipped to fully implement the science developed by nurse researchers prepared in PhD, DNSc, and other research-focused doctorates. For more information on the AACN's position, refer to the AACN Fact Sheet on the DNP, available at https://www.aacnnursing.org/News-Information/Fact-Sheets/DNP-Fact-Sheet.

As you begin clinical practice, it is a good idea to talk with as many nurses with graduate degrees as you can to see if

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

one of their roles might become your next goal. In 2018, 17.1% of the nation's RNs held a master's degree and 1.9% a doctoral degree as their highest educational preparation. The current demand for master's- and doctorally prepared nurses for advanced practice, clinical specialties, teaching, and research roles far outstrips the supply (AACN, 2019).

Continuing Education

The ANA defines continuing education as those professional development experiences designed to enrich the nurse's contribution to health. Colleges, hospitals, voluntary facilities, nursing organizations, and private groups offer formal continuing education through courses, seminars, and workshops. In many states, continuing education is required for an RN to maintain licensure. You will quickly learn that successful nurses are lifelong learners!

In-Service Education

Many hospitals and health care facilities provide education and training for employees of their institution or organization, called in-service education. This is designed to increase the knowledge and skills of the nursing staff. Programs may involve learning, for example, a specific nursing skill or how to use new equipment.

PROFESSIONAL NURSING ORGANIZATIONS

One of the criteria of a profession is having a professional organization that sets standards for practice and education. Nursing's professional organizations are concerned with current issues in nursing and health care, and influence health care policy and legislation. The benefits of belonging to a professional nursing organization include networking with colleagues, having a voice in legislation affecting nursing, and keeping current with trends and issues in nursing.

International Nursing Organization

The ICN, founded in 1899, was the first international organization of professional women. By sharing a commitment to maintaining high standards of nursing service and nursing education and by promoting ethics, the ICN provides a way for national nursing organizations to work together.

National Nursing Organizations

Professional nursing organizations in the United States include the ANA, the NLN, the AACN, the American Academy of Nursing (AAN), and many other specialty organizations such as the American Association of Critical-Care Nurses (AACN). The National Student Nurses' Association (NSNA) prepares students to participate in professional nursing organizations.

American Nurses Association

The ANA is the professional organization for RNs in the United States. Founded in the late 1800s, its membership is comprised of the state nurses' associations to which individual nurses belong. Its primary mission is to advance the profession of nursing to improve health for all. It is the premier organization representing the interests of the 4 million RNs in the United States. It advances the nursing profession by fostering high standards of nursing practice, promoting a safe and ethical work environment, bolstering the health and wellness of nurses, and advocating on health care issues that affect nurses and the public. Publications of the ANA include the *Code of Ethics for Nurses, American Nurse Today, The American Nurse,* and *OJIN: The Online Journal of Issues in Nursing*. The website NurseBooks.org provides access to the publishing program of the ANA. ANA electronic newsletters include *ANA SmartBrief, Nursing Insider, ANA ImmuNews,* and *Capitol Update*.

National League for Nurses

The NLN is an organization open to all people interested in nursing, including nurses, nonnurses, and facilities. Established in 1952, its objective is to foster the development and improvement of all nursing services and nursing education. The NLN conducts one of the largest professional testing services in the United States, including pre-entrance testing for potential students and achievement testing to measure student progress. It also serves as the primary source of research data about nursing education, conducting annual surveys of schools and new RNs. The organization also provides voluntary accreditation for educational programs in nursing.

American Association of Colleges of Nursing

The AACN is the national voice for baccalaureate and higher-degree nursing education programs. The organization's goals focus on establishing quality educational standards, influencing the nursing profession to improve health care, and promoting public support of baccalaureate and graduate education, research, and nursing practice. National accreditation for collegiate nursing programs is provided (based on meeting standards) through the AACN by the Commission on Collegiate Nursing Education (CCNE).

American Academy of Nursing

The AAN serves the public and the nursing profession by advancing health policy and practice through the generation,

synthesis, and dissemination of nursing knowledge. Its 2019–2020 policy priorities included Advancing Health Equity and Championing Wellness; Promoting Innovation and Sustainability; and Reducing Patient, Provider, and System Burden. Becoming a fellow of the Academy is a prized distinction. The AAN's approximately 2,700 fellows are nursing leaders in education, management, practice, and research (https://www.aannet.org/home).

National Student Nurses Association

Established in 1952 with the assistance of the ANA and the NLN, the NSNA is the national organization for students enrolled in nursing education programs. Through voluntary participation, students practice self-governance, advocate for student and patient rights, and take collective, responsible action on social and political issues.

Specialty Practice and Special-Interest Nursing Organizations

A wide variety of specialty practice and special-interest nursing organizations are available to nurses. These organizations provide information on specific areas of nursing, often have publications in the specialty area, and may be involved in certification activities. Examples of these organizations are listed in Box 1-5.

GUIDELINES FOR NURSING PRACTICE

Nursing controls and guarantees its practice through standards of practice, nurse practice acts and licensure, the ANA's *Code of Ethics for Nurses*, professional values, and the use of the nursing process. Each of these, which you will meet in later chapters, will guide your nursing education as a student and how you practice after graduation.

Box 1-5 Examples of U.S. Specialty Practice and Special Interest Nursing Organizations

American Academy of Nurse Practitioners
American Assembly for Men in Nursing
American Association for the History of Nursing
American Association of Nurse Attorneys
American Holistic Nurses Association
Association of Nurses in AIDS Care
American Association of Critical Care Nurses
Dermatology Nurses Association
Hospice Nurses Association
Oncology Nurses Society
Sigma Theta Tau International
Transcultural Nursing Society

Standards of Nursing Practice

The ANA's 2021 *Nursing: Scope and Standards of Practice* defines activities that are specific and unique to nursing. **Standards** allow nurses to carry out professional roles, serving as protection for the nurse, the patient, and the institution where health care is provided. The competencies articulated in the Standards describe expected levels of performance that integrate knowledge, skills, abilities, and judgments. Each nurse is accountable for their own quality of practice and is responsible for the use of these standards to ensure knowledgeable, safe, and comprehensive nursing care. Review the 2021 ANA standards that apply to the practice of professional nursing for all RNs, in all settings.

Concept Mastery Alert

Standards of Practice address the key steps involved in caring for patients; Standards of Professional Performance address the key concepts that the nurse integrates into their role as a professional nurse.

Nurse Practice Acts and Licensure

Nurse practice acts are laws established in each state in the United States to regulate the practice of nursing. They are broadly worded and vary among states, but all of them have certain elements in common, such as the following:

- Protect the public by defining the legal scope of nursing practice, excluding untrained or unlicensed people from practicing nursing.
- Create a state board of nursing or regulatory body having the authority to make and enforce rules and regulations concerning the nursing profession.
- Define important terms and activities in nursing, including legal requirements and titles for RNs and LPNs.
- Establish criteria for the education and licensure of nurses.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

The board of nursing for each state has the legal authority to allow graduates of approved schools of nursing to take the licensing examination. Those who successfully meet the requirements for licensure are then given a license to practice nursing in the state. The license, which must be renewed at specified intervals, is valid during the life of the holder and is registered in the state. Many states have a requirement for a specified number of continuing education units to renew and maintain licensure. The license and the right to practice nursing can be denied, revoked, or suspended for professional misconduct (e.g., incompetence, negligence, chemical impairment, or criminal actions).

There are two ways in which nurses can practice in a state other than in the one they were originally licensed. One is by **reciprocity**, which allows a nurse to apply for and be endorsed as an RN by another state. Some states are members of the Nurse Licensure Compact (NLC), allowing a nurse who is licensed and permanently lives in one of the member states to practice in the other member states without additional licensure. The Enhanced Nurse Licensure Compact (eNLC) increases access to care while maintaining public protection at the state level. Nurses with an original NLC multistate license will be grandfathered into the new eNLC. New applicants residing in compact states will need to meet 11 uniform licensure requirements (National Council of State Boards of Nursing, 2017).

As nursing roles continue to expand and issues in nursing are resolved, revised nurse practice acts will reflect those changes. All nurses must be knowledgeable about the specific nurse practice act for the state in which they practice. Check out the National Council of State Boards of Nursing Nurse Practice Act Toolkit, available at https://www.ncsbn.org/npa-toolkit.htm, to:

- Learn about the law and regulations that guide and govern nursing practice
- Locate your state nurse practice act and regulations
- Access nurse practice act educational resources

Code of Ethics and Professional Values

Professional values provide the foundation for nursing practice and will guide your interactions with patients, colleagues and the public. In 1998, the AACN (2008) identified five values that epitomize the caring, professional nurse: altruism, autonomy, human dignity, integrity, and social justice. These values are further specified in the ANA Code of Ethics for Nurses (ANA, 2015). Both are described in Chapter 6.

It is never too early for students to be intentional about cultivating the character that comports with professional nursing. Begin by asking yourself:

- Am I able to commit myself wholeheartedly to securing the interest of my patients—even when this entails self-sacrifice?
- Recognizing that we live in a society with great diversity, am I committed to respecting my patients' right to make their own decisions about health care?
- Am I able to respect the inherent worth and uniqueness of each individual and population, even when this is difficult?
- Do I value my own integrity sufficiently to challenge workplace cultures that expect me to be less than my personal best?
- Am I committed to making health care work for everyone, especially the most vulnerable?

Nursing Process and Other Clinical Judgment Models

The **nursing process** is another of the major guidelines for nursing practice. The essential activities involved in the nursing process are assessing, diagnosing, planning, implementing, and evaluating (see Unit III). The ANA *Nursing: Scope and Standards of Nursing Practice* (ANA, 2021) states that regardless of the theoretical knowledge base upon which nursing practice is derived, the knowledge fits within the multidimensional nursing process, the analytical, critical-thinking framework guiding professional thinking and activities. Nurses implement their roles through the nursing process, which integrates both the art and the science of nursing—that is, the nursing process is nursing made visible.

The nursing process is used by the nurse to identify the patient's health care needs and strengths, to establish and carry out a care plan to meet those needs, and to evaluate the effectiveness of the plan to meet established outcomes. The nursing process allows nurses to use critical thinking and clinical reasoning when providing thoughtful, person-centered care that is individualized and holistic and to define those areas of care that are within the domain of nursing. Clinical reasoning and judgment and the nursing process are fully described in Unit III. This unit also explores newer models including the Tanner/Lasater model and the National Council of State Boards of Nursing Clinical Judgment model.

THOUGHTFUL, PERSON-CENTERED PRACTICE FRAMEWORK

This text uses as its framework thoughtful, person-centered practice, which is described in Chapter 13. As you read through the text, you will see multiple examples of each of its elements and begin to develop facility in each of these elements. Your formation in professional nurse practice will include:

- Personal attributes, knowledge base, and clinical experience, which culminates in your development of blended and QSEN competencies and growing confidence;
- Clinical reasoning, judgment, and decision-making skills;

- Patient-centered nurse process competencies in assessing, diagnosing/problem identification, planning, implementing, and evaluating; and
- Ability to routinely engage in reflective practice leading to personal learning and improvement.

With each clinical experience, you should become more confident in your ability to think, act, and feel like a professional nurse—one who earns your patients' and the public's trust.

CURRENT TRENDS IN HEALTH CARE AND NURSING

The National Advisory Council on Nurse Education and Practice (NACNEP) identifies critical challenges to nursing practice in the 21st century: a growing population of hospitalized patients who are older and more acutely ill, increasing health care costs, and the need to stay current with rapid advances in medical knowledge and technology. You are sure to experience all of these as you begin your clinical practice. Complicating these challenges are an existing shortage of nurses (more acute in some regions than others), an aging nurse workforce, and prospects of a worsening nurse shortage (NACNEP, 2010, p. 1). The ANA identified four health care trends that will affect American nurses:

- Nursing shortages will offer unique opportunities.
- Job opportunities are expanding outside the hospital, and nurses will play a much bigger role in communities.
- Technology will play a larger role in nursing practice.
- Nurses will collaborate more with other health care providers.

According to the Association of American Medical Colleges (AAMC), many Americans are "medically homeless" and find it difficult to navigate the health care system when they need care or advice. In addition, the existing health care system financially rewards "patchwork" care provided by assorted clinicians instead of encouraging continuity and care coordination. These problems are compounded by a lack of shared health information systems that could make critical health information available to both patients and providers (AAMC, 2008, p. 2). You will learn more about these realities in Unit II. This much is clear: the public needs professional nurses who are "prepared to work when they are hired, willing to continue to learn, and ready to adapt their skills to the needs of the working environment" (NACNEP, 2010). The most recent NACNEP report (2016) emphasizes needed changes in policy, legislation, and research to strengthen nursing's ability to lead and to practice population health management initiatives and more health care transitions out of hospitals into the community (Fig. 1-2 on page 9).

The NLN has identified 10 trends to watch for in nursing education (Heller et al., 2000):

- Changing demographics and increasing diversity
- The technologic explosion
- Globalization of the world's economy and society
- The era of the educated consumer, alternative therapies, and genomic and palliative care
- The shift to population-based care and the increasing complexity of patient care
- The cost of health care and the challenge of managed care
- The impact of health policy and regulation
- The growing need for interdisciplinary education and for collaborative practice
- The current nursing shortage, and opportunities for lifelong learning and workforce development
- Significant advances in nursing science and research

Each of these trends continues to influence what and how you are taught and the challenges you will daily encounter in practice.

In 2011, the Institute of Medicine (IOM), now the National Academy of Sciences, Engineering, and Medicine, released the results of a groundbreaking study on the role of nurses in realizing a transformed health care system. The report, *The Future of Nursing: Leading Change, Advancing Health*, is "a thorough examination of how nurses' roles, responsibilities and education should change to meet the needs of an aging, increasingly diverse population and to respond to a complex, evolving health care system." The four key messages underlying the IOM's recommendations for transforming the nursing profession (IOM, 2011, p. 4) are as follows:

. Nurses should practice to the full extent of their education and training.
. Nurses should achieve higher levels of education and training through an improved education system that promotes seamless academic progression.
. Nurses should be full partners, with health care providers and other health professionals, in redesigning health care in the United States.
. Effective workforce planning and policy making require better data collection and an improved information infrastructure.

To read more about these recommendations for the future of nursing, visit the IOM website: http://www.nationalacademies.org/hmd.

An exciting follow-up to the *Future of Nursing* report is the Campaign for Action, which aims to ensure that everyone in America can live a healthier life, supported by a system in which nurses are essential partners in providing care and promoting health (Figures 1-3 and 1-4). Campaign for Action is working in every state to mobilize nurses, health

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

providers, consumers, educators, and businesses to strengthen nursing on multiple fronts, using the recommendations from the IOM's *Future of Nursing* report. The Campaign for Action works on seven major interrelated issues that together contribute to a healthier America through nursing: improving access to care, fostering interprofessional collaboration, promoting nursing leadership, transforming nursing education, increasing diversity in nursing, collecting workforce data, and building healthier communities. Visit the Campaign for Action website, https://campaignforaction.org.

FIGURE 1-3. Faculty and student lobby on the hill. Visit the Campaign for Action website,. See also Figures 1-3 and 1-4.

FIGURE 1-4. Campaign for Action. Building a healthier America through nursing. (*Source:* From Campaign for Action. https://campaignforaction.org/issues. Used with permission.)

Recognizing the key role nurses play in the health of Americans, the National Academies of Sciences, Engineering, and Medicine is currently working on a consensus report, *The Future of Nursing 2020–2031*, that charts a path for the

nursing profession to help the United States create a culture of health, reduce health disparities, and improve the health and well-being of the U.S. population in the 21st century. The report explores how nurses can work to reduce health disparities and promote equity, while keeping costs at bay, utilizing technology, and maintaining patient and family-focused care into 2030. This committee is considering newly emerging evidence related to the COVID-19 pandemic, and the report includes recommendations regarding the role of nurses in responding to the crisis created by a pandemic (https://www.nationalacademies.org/our-work/the-future-of-nursing-2020-2030).

The January 2017 issue of the *American Journal of Nursing* identified the top health care policy news stories of 2016. Gun violence topped the list. There were over 14,000 deaths and almost 29,000 injuries related to gun violence in the United States in 2016. Access to care was the second theme. In 2016, sexual and biologic sex minorities, including lesbian, gay, bisexual, and transgender people, were officially designated by the National Institutes of Health as a "health disparity population," allowing for more research on improving health and health care access for this population. Other access-to-care stories involved mental health care (one in five Americans experience mental health challenges, and resources are frequently unavailable), the rising costs of prescription drugs, and rural health care access (Sofer, 2017). Identified as stories to watch in 2017 were new cancer initiatives and precision medicine; climate change and health; changing trends in the use, misuse, and cost of drugs; and obesity (Potera, 2017). All of these remain relevant.

To address these challenges, employers will continue to seek nurses who have knowledge, skills, and attitudes that are aligned with the requirements of their practice environments, those who can work effectively in interprofessional teams across a variety of health care settings and those who can provide traditional nursing services as well as other needed services such as case and practice leadership, case management, health promotion, and disease prevention.

SELF-CARE

Hopefully this chapter has made you excited about your chosen profession and eager to begin professional practice. There are so many rewards that nursing offers each of us. You will, however, quickly learn that nursing is also a demanding profession, one the U.S. Department of Labor identifies as a hazardous occupation because of the numbers of nurses who miss workdays owing to occupational injuries or illness. As you begin clinical practice, remember that while the ANA Code of Ethics for Nurses reminds us that our primary duty is to the patient, it also reminds us (ANA, 2015a) that "the nurse owes the same duties to self as to others, including the responsibility to promote health and safety, preserve wholeness of character and integrity, maintain competence, and continue personal and professional growth." ANA designated 2017 the year of the Healthy Nurse, Healthy Nation, and invited us to reflect on how well we are executing our ethical duty to care for ourselves. ANA defines a **healthy nurse** as one who actively focuses on creating and maintaining a balance and synergy of physical, intellectual, emotional, social, spiritual, personal and professional well-being. Healthy nurses live life to the fullest capacity, across the wellness/illness continuum, as they become stronger role models, advocates, and educators, personally, for their families, their communities and work environments, and ultimately for their patients. Wei and Wei (2020) remind nurses that we must take control of our own health, especially in a time populated with new challenges and obstacles.

Nurse Self-Care Alert

Self-care is vital. See Figure 1-5 for a practical illustration of how you can elevate six strategies into a self-care model using the ENERGY acronym: **E**nergy source, **N**urturing kindness, **E**motional hygiene, **R**efocusing purpose, **G**erminating positivity, and **Y**our uniqueness.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

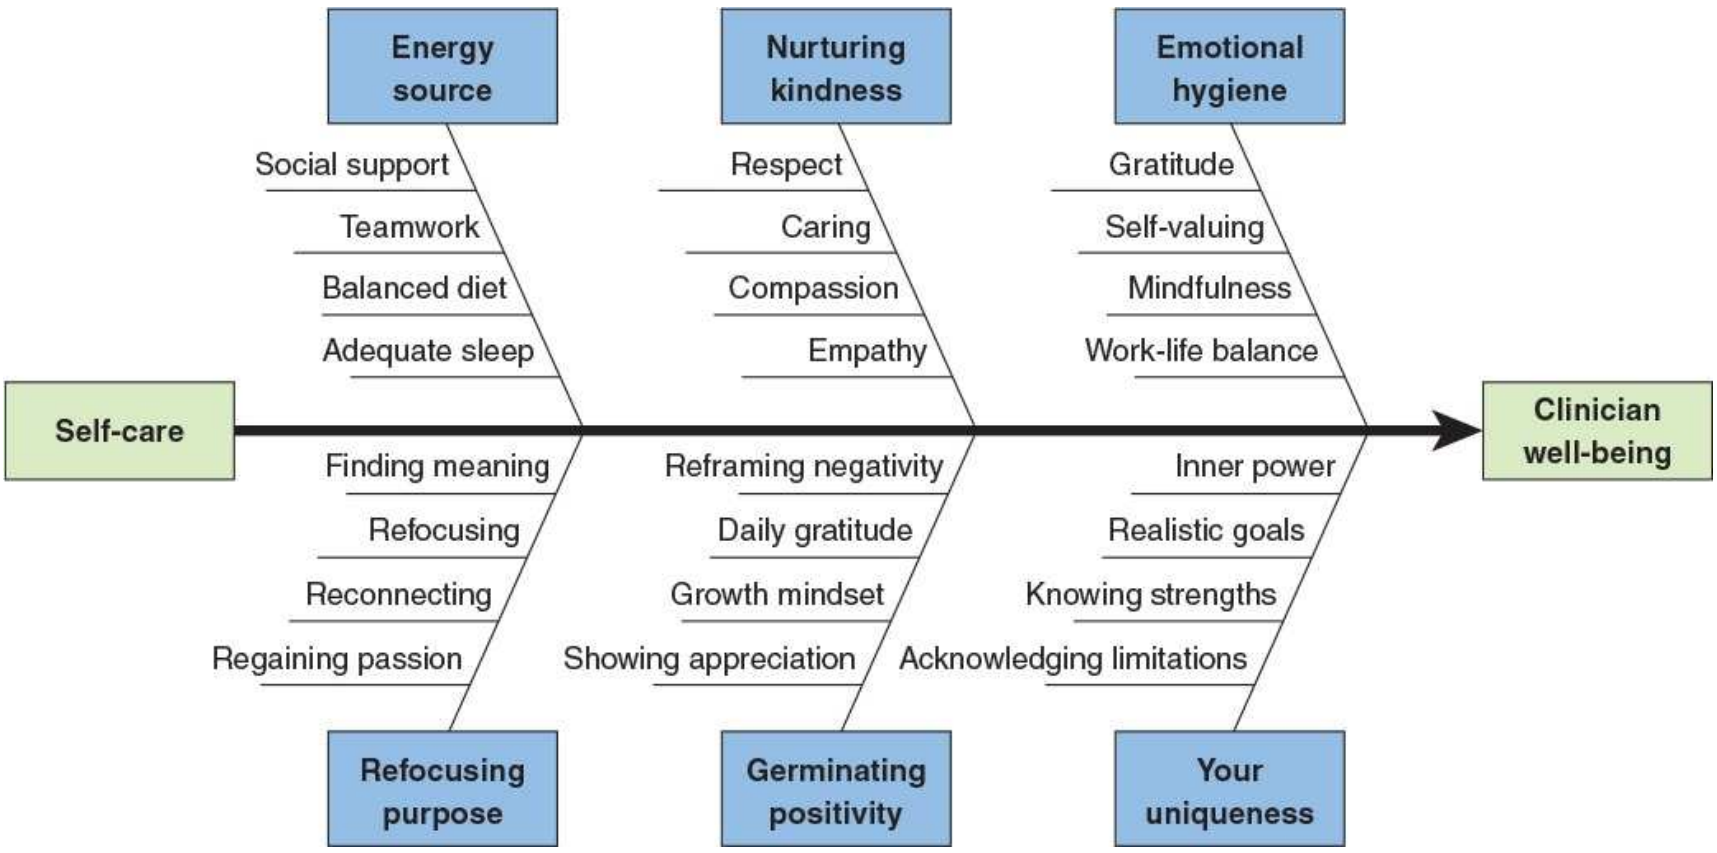

FIGURE 1-5. Use the ENERGY acronym for self-care: **E**nergy source, **N**urturing kindness, **E**motional hygiene, **R**efocusing purpose, **G**erminating positivity, and **Y**our uniqueness. (*Source:* Used with permission from Wei, H., & Wei, T. L. (2020). The power of self-care: An ENERGY model to combat clinician burnout. *American Nurse Journal*, *15*(10), 28–31. https://www.myamericannurse.com/wp-content/uploads/2020/09/an10-Energy-916.pdf)

It is easy to identify the challenges to nurses' living life to the full: understaffing and unrealistic nurse–patient ratios; night rotations; increased patient acuity; needing to come in early or leave late to complete work; regulatory demands; mandatory overtime; and an increasing number of abusive patients, families, and staff, not to mention the fact that many nurses are older and caring for children or aging parents. In 2020, the COVID-19 pandemic created new demands on nurses and exacerbated old demands. ANA President Ernest Grant (2020) wrote that frontline caregivers have become a vulnerable population:

- Risking infection by working without adequate PPE
- Witnessing the ravages of the disease
- Experiencing ethical conflicts

Suddenly, nurses having to balance their obligations to patients, themselves, their families, and communities became a daily challenge. Grant announced that to support nurses' short- and long-term needs, the American Nurses Foundation, in partnership with the ANA and three affiliated nursing organizations, developed a comprehensive mental health and well-being initiative, which is available at bit.ly/2yLKuU2. Its components include peer-to-peer conversations, a digital self-assessment tool, hotlines, and provider resources (Fig. 1-6). During the pandemic, more self-care resources were made available to nurses than ever before.

A study by Thacker et al. (2016) revealed that many nurses may not practice adequate self-care, especially when they feel they have too many competing priorities.

As a nurse, you must be alert to early signs of fatigue, as well as:

- **Compassion fatigue**: Loss of satisfaction from providing good patient care
- **Burnout**: Cumulative state of frustration with the work environment that develops over a long time
- **Secondary traumatic stress**: A feeling of despair caused by the transfer of emotion distress from a victim to a caregiver, which often develops suddenly

FIGURE 1-6. Going home checklist from the Well-Being Initiative. (*Source:* Used with permission from the American Nurses Foundation. https://www.nursingworld.org/_4a330c/globalassets/covid19/well-being-initiative-going-home-checklist-sharegraphic_06162020-final.png)

Healthy self-care practices include stress reduction training, the use of relaxation techniques, time management, assertiveness training, work–life balance measures, and meditation or mindfulness-based practices. Many health care professionals are learning how to use mindfulness practices as daily elements of their self-care. Howland and Bauer-Wu (2015, p. 12) describe **mindfulness** as the "capacity to intentionally bring awareness to present-moment experience with an attitude of openness and curiosity." Mindfulness promotes healing as you pause, focus on the present, and listen. Stopping to focus on your breathing before walking into a patient encounter helps you to focus your mind and allows you to then be more centered and more fully present with the patient.

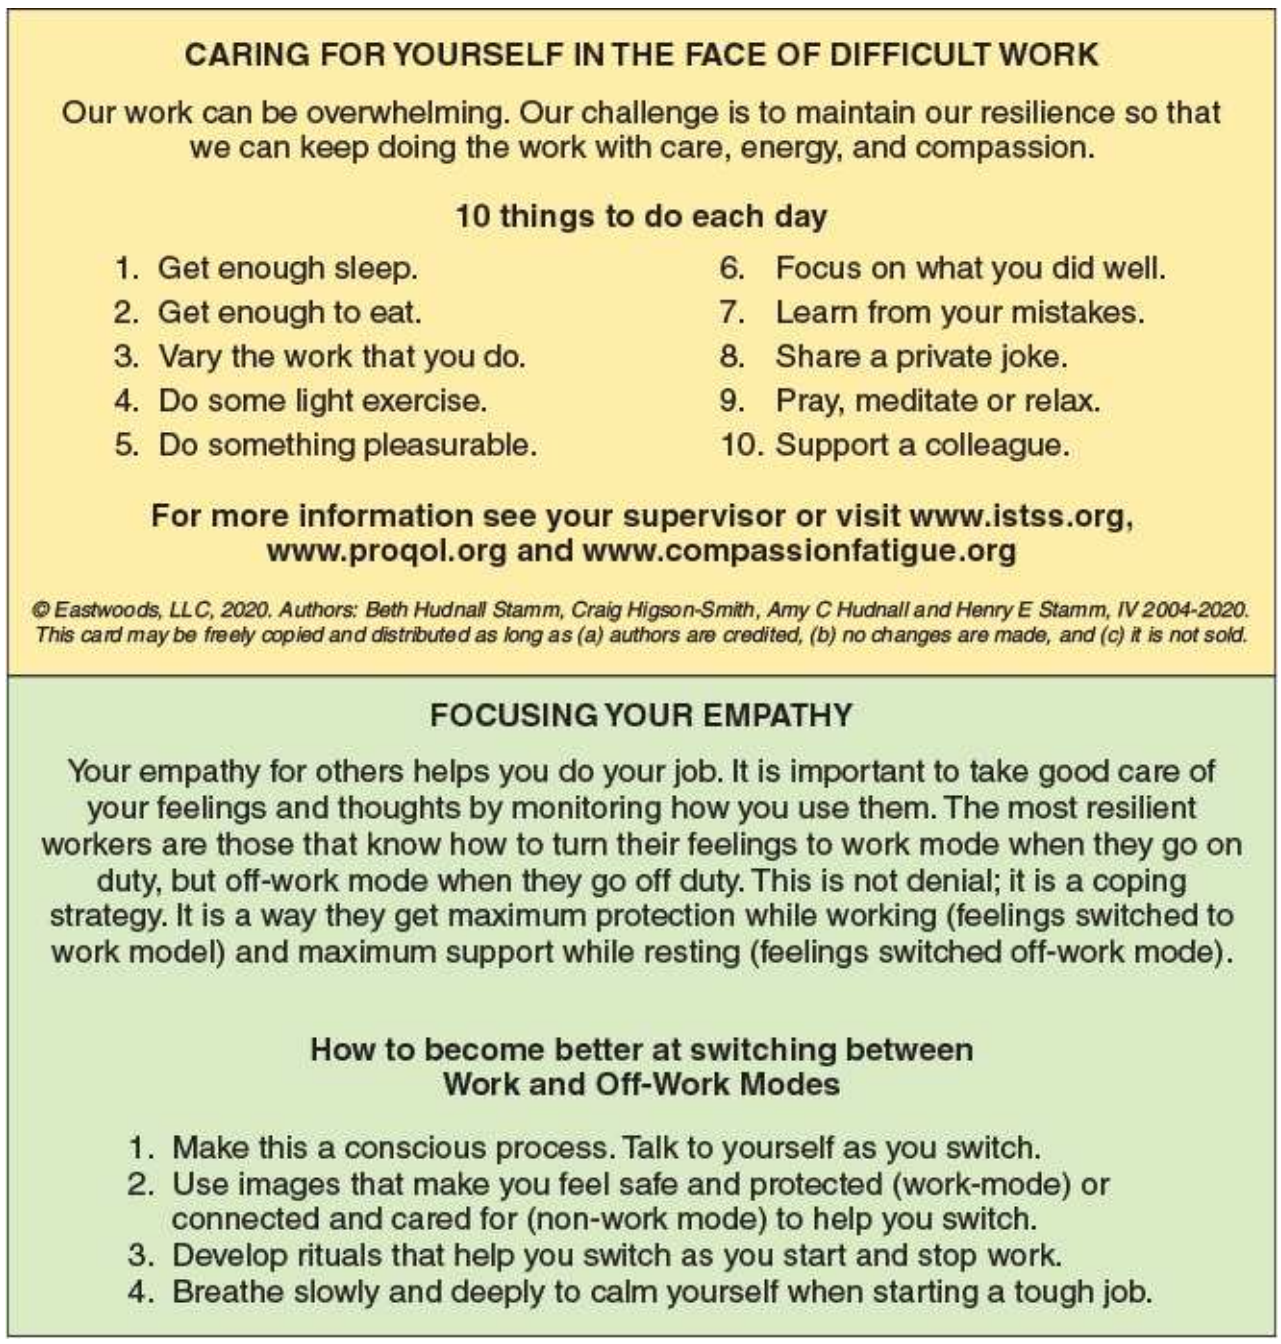
Nurse Self-Care Alert

Ponte and Koppel (2015) recommend using the STOP technique to reduce stress and be able to respond more skillfully during challenging times.

S—Stop and take a step back
T—Take a few breaths
O—Observe inside yourself
P—Proceed after you pause

Nurse Self-Care Alert

Nurse Sharon Tucker advocates a "Vital Signs Selfie Campaign" (Tucker, 2016). She urges nurses everywhere to take evidence-based action on an important set of vital signs for nurses using the BP–T–P–R technique:



- BP = Being Present (Have I cultivated the art of being truly present in each human encounter? Does my lifestyle support this?)
- T = Tracking (Am I tracking the numbers most important to my health: blood pressure, weight, blood sugar, lipid levels?)
- P = Practicing health and wellness behaviors (Am I a model of healthy behaviors?)
- R = Refueling (Do I get adequate sleep and find meaning, energy, and joy in many aspects of my life? When I am running on empty, how do I refuel?)

What do *your* vital signs say about *your* health and your ability to practice the art and science of thoughtful, person-centered care? And finally, check out the Professional Quality of Life Measure website (https://www.proqol.org) and keep its "Caring for Yourself in the Face of Difficult Work" pocket card handy (Fig. 1-7 on page 26). It just might turn out to be a life-saver as you start your clinical practice.

There is now a growing body of literature on **resilience**. Rajamohan et al. (2020) define resilience as an individual's

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

aptitude for overcoming an adverse life circumstance with a hopeful attitude; utilizing healthy internal coping mechanisms; and utilizing external resources, such as supportive work environments, mindfulness-based stress reduction training, and assertive communication skills training (p. 54). They devised the acronym REST to put these strategies into a practical format that you can use to categorize protective factors:

CARING FOR YOURSELF IN THE FACE OF DIFFICULT WORK

Our work can be overwhelming. Our challenge is to maintain our resilience so that we can keep doing the work with care, energy, and compassion.

10 things to do each day

1. Get enough sleep.
2. Get enough to eat.
3. Vary the work that you do.
4. Do some light exercise.
5. Do something pleasurable.
6. Focus on what you did well.
7. Learn from your mistakes.
8. Share a private joke.
9. Pray, meditate or relax.
10. Support a colleague.

For more information see your supervisor or visit www.istss.org, www.proqol.org and www.compassionfatigue.org

© Eastwoods, LLC, 2020. Authors: Beth Hudnall Stamm, Craig Higson-Smith, Amy C Hudnall and Henry E Stamm, IV 2004-2020. This card may be freely copied and distributed as long as (a) authors are credited, (b) no changes are made, and (c) it is not sold.

FOCUSING YOUR EMPATHY

Your empathy for others helps you do your job. It is important to take good care of your feelings and thoughts by monitoring how you use them. The most resilient workers are those that know how to turn their feelings to work mode when they go on duty, but off-work mode when they go off duty. This is not denial; it is a coping strategy. It is a way they get maximum protection while working (feelings switched to work model) and maximum support while resting (feelings switched off-work mode).

How to become better at switching between Work and Off-Work Modes

1. Make this a conscious process. Talk to yourself as you switch.
2. Use images that make you feel safe and protected (work-mode) or connected and cared for (non-work mode) to help you switch.
3. Develop rituals that help you switch as you start and stop work.
4. Breathe slowly and deeply to calm yourself when starting a tough job.

FIGURE 1-7. Caring for Yourself in the Face of Difficult Work" pocket card.

- **R**elationships with self and others
- **E**xercise (care of the mind, body, and spirit)
- **S**oul (compassionate emotional care)
- **T**ransformative thinking leading to thoughtful action

You will certainly experience stress as you struggle to meet your duties to self, to family, and to your patients and communities, as you meet all the demands of being a student. Be aware and reflective, pay attention to what your body is telling you, cultivate the type of supportive relationships that you can lean into for support, and learn about and utilize the resources you need. As you move through the chapters in this text, you will find appropriate self-care alerts and promoting health boxes. Remember, we cannot give what we don't have. If our own basic needs are not met, we will not be able to identify and meet the needs of the patients, families, and communities we serve.

DEVELOPING CLINICAL REASONING AND CLINICAL JUDGMENT

. Consider the roles and functions of professional nursing (see Table 1-2). Interview several nurses in different settings to see how much value they attach to these roles and how much time they can devote to them. Two great questions to ask practicing nurses: What breaks your heart? What makes you come alive?

. Describe how a nurse would meet the aims of nursing as described in this chapter—promoting health, preventing illness, restoring health, and facilitating coping with death or disability—when caring for the following patients:

- A single mother who has just delivered her first child and is scheduled to be discharged 12 hours after delivery.
- An 82-year-old woman who wants to begin an exercise program.
- A 70-year-old woman newly diagnosed with atrial fibrillation who is admitted for a cardioversion and currently taking blood-thinning medication.
- A fellow nursing student who is tired of COVID-19 restrictions who wants to "party" now that she is back in school, but your university is currently in a "hot spot" where COVID-19 numbers are rising.

As you consider these situations, try to identify factors that either promote or inhibit the fulfilling of these aims.

. How would you rate the adequacy of your self-care? On any given day would you describe yourself as "energized to heal" or "just about making it"? Ask nurses to talk about how they balance their duty to make patients their primary commitment with the duty to self-care.
. Review Box 1-3, Tips for Thinking, Acting, and Feeling Like a Nurse. Talk with other students about how you each would want to think, act, and feel in these situations:

- You realize when asked to discharge an 84-year-old male patient with chronic obstructive pulmonary disease (COPD) and other comorbidities that he lives alone and has no family or neighbor caregivers. His discharge orders include having to make follow-up appointments with other providers and to get new prescriptions filled. No one seems to have "caught" that his self-care activities are limited. You know the hospital is "full" and there is a crunch for beds.
- You are working labor and delivery and a woman, who speaks Spanish only, is frightened because the obstetrician just told her that she may need a cesarean delivery because her water broke hours ago and the baby doesn't seem to be in any hurry to come. You speak some Spanish, but not fluently, and no one yet has tried to secure translation services. You understand how frightened the mom must be and this obstetrician is not known for his bedside manner.
- You are a professional nurse working in a community nursing home. Among your other responsibilities are wound care. You always sign your new dressings and are dismayed when returning to work after a 3-day holiday to see that no one had changed what should be a daily dressing. When you report this, you are asked, "Why do you care so much? These residents don't know what is going on. They won't complain."

PRACTICING FOR NCLEX

. A nurse is planning education for a patient who is scheduled for a diagnostic procedure to rule out a cerebral aneurysm. Which aspect of nursing does the nurse use as the basis for education?

a. Art of nursing
b. Science of nursing
c. Caring aspect of nursing
d. Holistic approach to nursing

. A group of students in a community health course is discussing disaster management. Which nursing leader will the students identify as the founder of the Red Cross?

a. Clara Barton
b. Florence Nightingale
c. Lillian Wald
d. Lavinia Dock

. A nurse is engaged in community health promotion activities. What activity best reflects this type of health promotion?

a. Teaching about fall prevention and home safety at a senior center
b. Holding a blood glucose screening for diabetes at a local church
c. Educating hospice volunteers on therapeutic communication
d. Providing education on crutch walking to a child with a fractured tibia

. A nurse historian is researching changes in professional nursing and nursing education in the mid-20th century. What trend promoted advancement of the profession and of nursing education?

a. Increased need for nurses and knowledge explosion led to emphasis on education.
b. Focus on the war effort slowed development of knowledge in medicine and technology.
c. Role of the nurse focused on acute technical skills used in hospital settings.
d. Nursing care was dependent on the medical profession to define its priorities.

. According to *Nursing: Scope and Standards of Practice* (ANA, 2021), "Nursing is the diagnosis and treatment of human response, and advocacy in the care of individuals, families, groups, communities, and populations in recognition of the connection of all humanity. Which actions are consistent with these nursing roles? Select all that apply.

a. Offering emotional support to a patient overwhelmed by a new diagnosis of ovarian cancer
b. Making a diagnosis of appendicitis when a patient reports right lower quadrant pain
c. Providing classes on nutrition and physical activity at a senior center
d. Administering an antibiotic to a patient with a documented infection
e. Working with the health department to provide free influenza vaccinations to children
f. Requesting the health care provider change prescription for the patient whose pain is still unrelieved

. A nurse working in a rehabilitation facility focuses on the goal of restoring health for patients. Which nursing interventions could the nurse use to meet this goal? Select all that apply.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

a. Counseling adolescents in a drug rehabilitation program
b. Performing range-of-motion exercises for a patient on bedrest
c. Demonstrating insulin injection to a patient with diabetes
d. Recommending a yoga class for a busy executive
e. Providing hospice care for a patient with end-stage cancer
f. Teaching a nutrition class at a local high school

. Nursing students are learning about the criteria that establish nursing as a profession. Which statements by the students indicate they have correctly described characteristics of a profession? Select all that apply.

a. Nursing is composed of a well-defined body of general knowledge.
b. Nursing interventions are dependent upon medical practice.
c. Nursing is a recognized authority by a professional group.
d. Nursing practice is regulated by the medical profession.
e. Nursing has a code of ethics.
f. Nursing is influenced by ongoing research.

. A nurse considers returning to school to obtain a master's degree in nursing. Which practice discipline requiring graduate level education could the nurse consider?

a. Rehabilitation nurse
b. Critical care nurse
c. Oncology nurse
d. Nurse practitioner

. Nurses in the United States follow regulations outlined by each state's nurse practice act. A nurse moving to a different state anticipates finding which elements are common to all states' nurse practice acts?

a. Definition of the legal scope of nursing practice for those registered
b. Provision of continuing education programs to meet state requirements
c. Determining the scope of content covered in the NCLEX examination
d. Creating institutional policies for health care practices

. Nurses of a statewide nursing organization come together to plan for the challenges to health care for the 21st century. What current trend in health care should be a focus of the plan?

a. Decreasing numbers of hospitalized patients
b. Increasing numbers of older and more acutely ill patients
c. Decreasing health care costs owing to managed care
d. Decreasing advances in medical knowledge and technology

ANSWERS WITH RATIONALES

. **b.** The science of nursing is the knowledge base for care that is provided. In contrast, the skilled application of that knowledge is the art of nursing. Providing holistic care to patients based on the science of nursing is considered the art of nursing.

. **a.** Clara Barton established the Red Cross in the United States in 1882. Florence Nightingale elevated the status of nursing to a respected occupation, improved the quality of nursing care, and founded modern nursing education. Lillian Wald was the founder of public health nursing. Lavinia Dock was a nursing leader and women's rights activist instrumental in establishing women's right to vote.

. **a.** Nurses promote health and prevent illness primarily by teaching, through personal example and administering preventative vaccinations. Performing blood glucose screening for diabetes detects a disease after it has developed, rather than diabetes prevention. Therapeutic communication during hospice care and crutch walking are additional interventions used for diseases or health problems already present.

. **a.** During World War II, large numbers of women worked outside the home. They became more independent and assertive, leading to an increased emphasis on education. The war itself created a need for more nurses and resulted in a knowledge explosion in medicine and technology.

. **a, c, d, e, f.** Education, emotional support, nursing interventions such as administering medications, preventing influenza and infectious diseases, and advocating for improved pain management are roles of the nurse. Making a medical diagnosis is not within the scope of professional nursing practice.

. **a, b, c.** Activities to restore health focus on the person with an illness and range from early detection of a disease to rehabilitation and teaching during recovery. These activities include drug counseling, teaching patients how to administer their medications, and performing range-of-motion exercises for bedridden patients. Recommending a yoga class for stress reduction helps prevent illness, and teaching a nutrition class helps promote health. A hospice nurse

facilitates coping with disability and death.

- **c, e, f.** Nursing is recognized increasingly as a profession based on the following defining criteria: well-defined body of specific and unique knowledge, strong service orientation, recognized authority by a professional group, code of ethics, professional organization that sets standards, ongoing research, and autonomy and self-regulation.
- **d.** A master's degree (MSN) prepares advanced practice nurses, nurse practitioners (NPs), nurse midwives, clinical specialists, or clinical nurse leaders.
- **a.** State nurse practice acts regulate practice by defining the legal scope of practice, creating a state board of nursing to make and enforce rules and regulations, define important terms and activities in nursing, and establish criteria for the education and licensure of nurses. The state's board of nursing has the legal authority define the education required to take NCLEX but does not provide that education or determine the content of the examination. The board has the legal authority to allow graduates of approved schools to take the licensing examination. Institutional policies are created by the institutions themselves.
- **b.** The National Advisory Council on Nurse Education and Practice identifies the following critical challenges to nursing practice in the 21st century: A growing population of hospitalized patients who are older and more acutely ill, increasing health care costs, and the need to stay current with rapid advances in medical knowledge and technology.

2

Theory, Research, and Evidence-Based Practice

Joe Wimmer

Joe, a first-time father of a healthy 8-lb baby girl delivered several hours ago, is visiting with his wife and new daughter. He asks, “Why is my daughter wearing that funny little cap on her head?”

Rachel Whang

Rachel, the daughter of a 57-year-old patient being discharged with an order for intermittent nasogastric tube feedings, is being taught how to perform the procedure. During one of the teaching sessions, Rachel asks, “How will I know that the tube is in the right place?”

Maribella Santos

Maribella, who had just arrived back on the unit after undergoing abdominal surgery, is complaining of

nausea. A while later she states, “My nausea is gone. The nurse did something with her hands and the feeling just went away.”

Learning Outcomes

After completing the chapter, you will be able to accomplish the following:

. Explain the sources of nursing knowledge and historical influences on nursing knowledge.
. Compare and contrast systems theory, adaptation theory, and developmental theory.
. Explain the significance of the four concepts common to all nursing theories.
. Discuss the evolution of nursing research.
. Compare and contrast quantitative and qualitative research methods.
. Describe evidence-based practice in nursing, including the rationale for its use.
. Outline the steps in implementing evidence-based practice.
. Read and understand, on a beginning level, a published research article.
. Use a framework to evaluate the salience of a research study.

Nursing Concepts

Evidence-based practice
Quality improvement

Key Terms

applied research
basic research
concepts
conceptual framework or model
data
deductive reasoning
evidence-based practice (EBP)
evidence-based practice guidelines
inductive reasoning
informed consent
nursing research
nursing theory
research
research utilization (RU)
qualitative research
quality improvement (QI)
quantitative research
scholarly inquiry
systematic reviews
theory

Nursing is a unique health care discipline in which nurses provide a service based on knowledge and skill. Nursing has two essential elements: a body of knowledge and the application of that knowledge in nursing care interventions. The body of knowledge provides the rationale for nursing interventions. There is a growing knowledge base developed specifically for nursing through theory development and research (see the accompanying Reflective Practice display for an example). Rationales for nursing interventions also come from many different disciplines, including anatomy, physiology, chemistry, nutrition, psychology, and sociology. This chapter discusses the concepts of nursing knowledge,

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

nursing theory, nursing research, and evidence-based practice (EBP) as separate entities, but in fact, they are often intertwined in clinical practice.

NURSING KNOWLEDGE

Knowledge is an awareness of reality acquired through learning or investigation. Every person collects, organizes, and arranges facts to build a knowledge base relevant to one's personal reality. The knowledge base for professional nursing practice includes nursing science, philosophy, and ethics; biology and psychology; and the social, physical, economic, organizational, and technologic sciences. Nursing's Social Policy Statement (American Nurses Association [ANA], 2010, pp. 13–14; Fowler, 2015) lists the following as issues that nurses address in partnership with individuals, families, communities, and populations:

- Promotion of health and wellness
- Promotion of safety and quality of care
- Care, self-care processes, and care coordination
- Physical, emotional, and spiritual comfort, discomfort, and pain
- Adaptation to physiologic and pathophysiologic processes
- Emotions related to the experience of birth, growth and development, health, illness, disease, and death
- Meanings ascribed to health, illness, and other concepts
- Linguistic and cultural sensitivity
- Health literacy
- Decision making and the ability to make choices
- Relationships, role performance, and change processes within relationships
- Social policies and their effects on health
- Health care systems and their relationships to access, cost, and quality of health care
- The environment and the prevention of disease and injury

As you reflect on this list, you can see why your nursing education is so important and why professional nurses are lifelong learners.

Sources of Knowledge

Knowledge comes from a variety of sources and may be traditional, authoritative, or scientific.

Traditional Knowledge

Traditional knowledge is that part of nursing practice passed down from generation to generation. When questioned about the origin of such nursing practices, nurses might reply, "We've always done it this way." Changing bedclothes is an example of how traditional knowledge has affected nursing practice. It is customary in acute care settings to change a patient's bedclothes daily, whether soiled or not. There are no research data to support this, yet virtually millions of hospital beds are changed daily because this practice is accepted as a necessary component of quality patient care. Until this practice is challenged scientifically and its assumed value disproved, it will remain a traditional part of patient care. Table 2-1 (on page 33) illustrates practical examples of moving from traditions to EBP. Read Upvall, Bourgault, Pigon, and Swartzman (2019) to see exemplars illustrating de-implementation of tradition-based practices.

Authoritative Knowledge

Authoritative knowledge comes from an expert and is accepted as truth based on the person's perceived expertise—for example, when a senior staff nurse teaches a new graduate nurse a more efficient method of doing a technical procedure, such as inserting an intravenous catheter. The senior nurse has gained knowledge through experience, and the new graduate nurse accepts it as truth based on the perceived authority of the experienced nurse. Authoritative knowledge generally remains unchallenged as long as presumed authorities maintain their perceived expertise.

QSEN Reflective Practice: Cultivating QSEN Competencies

CHALLENGE TO COGNITIVE SKILLS

One of the nurses, Danielle, on a surgical floor where I was assigned, took a course in therapeutic touch. When she returned to work, she was eager to use her new "intervention." My patient, Maribella Santos, had come back to the unit after undergoing abdominal surgery. Upon her return, she complained of nausea. Danielle used her "unruffling" technique to calm the patient, whose nausea then "disappeared." Excited, I reported this in postconference, only to learn from my instructor that therapeutic touch was "a lot of bunk" without scientific support.

Thinking Outside the Box: Possible Courses of Action

- Accept my instructor's dismissal of therapeutic touch.
- Learn more about therapeutic touch from my colleague Danielle and professional literature.
- Become an advocate for therapeutic touch if it *does* work!

Evaluating a Good Outcome: How Do I Define Success?

- Patient is not harmed by anyone using an unproven therapy.
- Patient benefits from my openness to new (potentially beneficial) therapies.
- I rely on research and EBP, not hearsay, as a basis for my clinical judgments and actions.

Personal Learning: Here's to the Future!

I was surprised to find the literature so inconclusive about the benefits of therapeutic touch. Obviously, its adherents claim that they can measure its efficacy. Others find these claims unsupported. Since this event happened at the beginning of my clinical rotation, I decided to observe Danielle throughout my rotation. What I saw made me a believer in this technique. Danielle was using therapeutic touch as an adjuvant to other therapies and it seemed to be working. I want to learn more about this technique. My goal is to attend a workshop on therapeutic touch to see if it is something I can incorporate into my practice.

Katherine Figliala, Georgetown University

QSEN SELF-REFLECTION ON QUALITY AND SAFETY COMPETENCIES DEVELOPING KNOWLEDGE, SKILLS, AND ATTITUDES FOR CONTINUOUS IMPROVEMENT

How do you think you would respond in a similar situation? Why? What does this tell you about yourself and about the adequacy of your competencies for professional practice? Can you think of other ways to respond? Do you agree with the criteria that the nursing student used to evaluate a successful outcome? Why or why not? What *knowledge, skills*, and *attitudes* do you need to develop to continuously improve the quality and safety of care?

Patient-Centered Care: What information should be communicated to Maribella Santos and other patients about the use of therapeutic touch to involve them as partners in the use of this technique?

Teamwork and Collaboration/Quality Improvement: Other members of the professional caregiving team can have positive and negative effects on us. In what ways do you practice so as to remain open to learning new interventions from colleagues and not allow negativity to inhibit your creativity?

Safety/Evidence-Based Practice: What sources of knowledge did the nursing student use? Did the nursing student use theory and research? If so, please explain how. Would you consider therapeutic touch to be EBP? Why or why not? How might the patient's personal values or beliefs have affected the response? Might patients be harmed through the use of a new intervention such as therapeutic touch? What safeguards exist in practice sites to prevent reckless experimentation on patients? When a review of the literature proves inconclusive, on what should we base our judgment about the efficacy of therapeutic touch or other interventions?

Informatics: What research strategy is likely to yield the best evidence about the efficacy of therapeutic touch? Can you identify the essential information that must be available in a patient's record about the use of therapeutic touch?

As you begin your clinical experience, you may observe experienced nurses doing procedures differently than you learned to do them in a fundamentals course or skills lab. You should always bring a questioning attitude to these discoveries. "I notice that your technique is different from what I learned. Can we talk about the differences and what informs your practice?" Your student status allows you to honestly question even the experts, and, in this way, we all learn to identify best practices. Today's safety emphasis on "see something, say something," mandates that we question differences in practice.

Table 2-1 Moving From Traditions to Evidence-Based Practice Interventions

CATEGORY	TRADITION	EVIDENCE-BASED INTERVENTION
Respiratory	Saline instillation for secretion removal	Normal saline should not be instilled as a routine step with endotracheal suctioning; instilling saline will not

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

		enhance removal of secretions.
	Excessive sedation; avoiding sedation and daily awakening practice	Interrupt sedation daily to assess patients' neurologic status and/or readiness for reduced ventilator support or extubation.
Psychosocial	Restricting intensive care unit visitation	Open visitation 24/7 enhances patient/family engagement and does not have adverse physiologic impact on patients' outcomes.
Hospital-acquired conditions	Early removal of urinary catheters to reduce catheter-associated urinary tract infections is not possible in the intensive care unit	Nurse-driven interventions to reduce catheter-associated infections focus on addressing the need for the catheter, sterile/aseptic catheter insertion, keeping drainage bag below the level of the bladder at all times, daily catheter care, and prompt removal of catheter.

Scientific Knowledge

Scientific knowledge is knowledge obtained through the scientific method (implying thorough research). New ideas are tested and measured systematically using objective criteria.

Think back to **Maribella Santos**, the woman complaining of nausea after undergoing abdominal surgery. The nurse would integrate scientific knowledge about the effects of surgery and anesthesia on the body and the side effects of pain medication to develop the postoperative care plan.

Significance of Knowledge Sources

All sources of knowledge are useful in the collective body of knowledge that constitutes the nursing profession. Although these three sources provide nursing with important contributions, each has inherent strengths and limitations. Both traditional and authoritative knowledge are practical to implement but are often based on subjective data, limiting their usefulness in a wide variety of practice settings. For this reason, nurses increasingly focus on scientific knowledge to provide care, commonly called EBP, a topic that will be thoroughly discussed later in this chapter. Table 2-1 illustrates the importance of scientific knowledge.

Historical Influences on Nursing Knowledge

The development of nursing knowledge has been influenced by the early work of Florence Nightingale, later nurse researchers and theorists, and societal changes.

Nightingale's Contributions

Nightingale influenced nursing knowledge and practice by demonstrating efficient and knowledgeable nursing care, defining nursing practice as separate and distinct from medical practice, and differentiating between health nursing and illness nursing (Hammer, 2020; Hundt, 2020). (See Chapter 1 for further information.)

The training of nurses was initially carried out under the direction and control of the medical profession. Because the conceptual and theoretical basis for nursing practice came from outside the profession, nursing struggled for years to establish its own identity and to receive recognition for its significant contributions to health care.

Societal Influences on Nursing Knowledge

Most early schools of nursing established in the United States were adapted from Nightingale's model. There was no planned educational curriculum; instead, knowledge was acquired from lectures by physicians and through practical experience by caring for sick people in hospitals. This service orientation for nursing education remained the strongest influence on nursing practice until the 1950s. Nursing care was carried out under the control and direction of the hospital administration and physicians practicing in that hospital. Nursing care was based on traditional ideas about following orders, as well as on common wisdom about caring for others based on either "common sense" or widely accepted scientific principles (Chinn & Kramer, 2019). As a result, nursing knowledge remained undeveloped and fragmented.

During the first half of the 20th century, a change in the structure of society resulted in changed roles for women and, in turn, for nursing. As a result of World Wars I and II, women increasingly entered the workforce, became more independent, and sought higher education. At the same time, nursing education began to focus more on education than hands-on training, and nursing research was conducted and published. As women became more independent and assertive, nursing's need for a clearly defined identity based on unique contributions to the health care system emerged. In the mid-20th century, the idea of nursing as a science became more generally accepted, and philosophic beliefs and a knowledge base for nursing practice began to evolve. Today the proliferation of graduate nursing programs, including the PhD in nursing, demonstrate society's acceptance of nursing science.

In the 21st century, the Institute of Medicine (IOM), now the National Academy of Sciences, Engineering, and Medicine (NASEM), issued its seminal report, *The Future of Nursing* (IOM, 2011), which identifies research priorities for transforming nursing practice, nursing education, and nursing leadership. "Taken together, the recommendations are meant to provide a strong foundation for the development of a nursing workforce whose members are well educated and well prepared to practice to the full extent of their education, to meet the current and future health needs of patients, and to act as full partners in leading change and advancing health" (IOM, 2011, p. 271). The IOM report and the 2015 update on progress are available at https://nam.edu. Recognizing the key role nurses play in the health of Americans, the NASEM is currently working on an updated consensus report, *The Future of Nursing 2020–2031*, that charts a path for the nursing profession to help the United States create a culture of health, reduce health disparities, and improve the health and well-being of the U.S. population in the 21st century.

NURSING THEORY

A **theory** is composed of a group of concepts that describe a pattern of reality. **Concepts**, such as ideas, are abstract impressions organized into symbols of reality. Concepts describe objects, properties, and events and relationships among them. A group of concepts that follow an understandable pattern makes up a **conceptual framework or model**. Concepts can be thought of as the individual bricks and boards used to build a house, with the conceptual framework being the blueprint that specifies where each brick and board should go. Theories can be tested, changed, or used to guide research or to provide a base for evaluation. They are derived through two principal methods: **deductive reasoning**, in which one examines a general idea and then considers specific actions or ideas, and **inductive reasoning**, in which the reverse process is used—one builds from specific ideas or actions to conclusions about general ideas.

Nursing theory is developed to describe nursing. Nursing theory differentiates nursing from other disciplines and activities in that it serves the purposes of describing, explaining, predicting, and controlling desired outcomes of nursing care practices. Thus, theories provide a means of testing knowledge through research and for expanding nursing's knowledge base to meet the health care needs of patients in an ever-changing society.

Interdisciplinary Base for Nursing Theories

Nursing theories are often based on, and influenced by, other broadly applicable processes and theories. The ideas and principles of the theories described briefly in the following sections are basic to many nursing concepts and are a part of the nursing literature. Nurses need to understand these theories and terminologies as they develop their own knowledge base in nursing.

Box 2-1 **Key Points in General Systems Theory**

- A system is a set of interacting elements, all contributing to the overall goal of the system. The whole system is always greater than the sum of its parts.
- Systems are hierarchical in nature and are composed of interrelated subsystems that work together in such a way that a change in one element could affect other subsystems, as well as the whole.
- Boundaries separate systems both from each other and from their environments.
- A system communicates with and reacts to its environment through factors that enter the system (input) or are transferred to the environment (output).
- An open system allows energy, matter, and information to move freely between systems and boundaries, whereas a closed system does not allow input from or output to the environment (no totally closed

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

systems are known to exist in reality).
- To survive, open systems maintain balance through feedback.

General Systems Theory

General systems theory has been used in a wide range of disciplines since it emerged in the 1920s. Its primary theorist, Ludwig von Bertalanffy, developed the theory for universal application. This theory describes how to break whole things into parts and then to learn how the parts work together in "systems." It emphasizes relationships between the whole and the parts and describes how parts function and behave. These concepts may be applied to different kinds of systems, for example, molecules in chemistry, cultures in sociology, organs in anatomy, and health in nursing. The key points in general systems theory are outlined in Box 2-1.

Recall **Maribella Santos**, the woman described in the Reflective Practice box who received therapeutic touch? The nurse would need to integrate knowledge of systems theory, including system communication, open systems, and energy transfer to better understand the goal of this technique.

Adaptation Theory

Adaptation theory defines adaptation as the adjustment of living matter to other living things and to environmental conditions. Adaptation is a continuously occurring process that effects change and involves interaction and response. Human adaptation occurs on three levels: the internal (self), the social (others), and the physical (biochemical reactions). Chapter 43 describes adaptation in relation to stress.

Developmental Theory

Developmental theory outlines the process of growth and development of humans as orderly and predictable, beginning with conception and ending with death. Although the pattern has definite stages, the progress and behaviors of a person within each stage are unique. Heredity, temperament, emotional and physical environment, life experiences, and health status influence the growth and development of a person.

Several theorists have made important contributions to developmental theory, but only two are mentioned here because their work is often used to develop nursing theory and to organize nursing practice. Erik Erikson based his theory of psychosocial development on the process of socialization, emphasizing how people learn to interact with the world. Erikson recognized the role of social, biologic, and environmental factors in development, and defined specific tasks or conflicts that people accomplish or overcome during what he defined as the eight stages of life. Chapters 22 to 24 present more information on developmental theory.

Abraham Maslow developed his theory of human needs in terms of physical and psychosocial needs considered essential to human life, rather than by chronologic age as Erikson did. As described in Chapter 4, Maslow defined five levels of need in a hierarchy, with different needs existing simultaneously.

Think back to **Joe Wimmer**, the new father of a baby girl. When explaining about the use of the cap on the baby's head, the nurse would incorporate knowledge of Maslow's hierarchy of needs, specifically physiologic needs, and the need to minimize heat loss as a priority.

As you continue in your nursing education and practice, you will learn how systems, adaptation, and developmental theories are used in planning and giving holistic care to patients. The following sections on specific nursing theories will help you better understand the knowledge base used to develop the concepts unique to nursing.

Nursing Theories

Even though nurses have difficulty agreeing on precise definitions of nursing, theory-based nursing directs nurses toward a common goal, with the ultimate outcome being improved person-centered care. Nursing theory provides rational and knowledgeable reasons for nursing interventions, based on descriptions of what nursing is and what nurses do. In addition, nursing theory gives nurses the knowledge base necessary for acting and responding appropriately in nursing care situations, provides a base for discussion, and, ideally, helps resolve current nursing issues. Theory gives nurses who know and practice theory better problem-solving skills, so that nursing interventions are better organized, considered, and purposeful. Nursing theory also prepares nurses to question assumptions and values in nursing, thus further defining nursing and increasing the knowledge base.

Nursing theories identify and define interrelated concepts important in nursing and clearly state the relationships between and among these concepts. Nursing theories should be simple and general; simple terminology and broadly applicable concepts ensure their usefulness in a wide variety of nursing practice situations. Nursing theories should also increase the nursing profession's body of knowledge by generating research to guide and improve practice. Overall, nursing theory guides nursing practice by providing a knowledge base, organizing concepts, providing guidelines for practice, and identifying nursing care goals.

Nursing theories may be descriptive or prescriptive (Meleis, 2018). Descriptive theories describe a phenomenon, an event, a situation, or a relationship. They further identify the properties and components of each of these as well as the circumstances in which it occurs. Prescriptive theories address nursing interventions and the consequences of those interventions; they are designed to control, promote, and change clinical nursing practice.

The aims of nursing, described in Chapter 1, are the same for all nursing theorists, but the values, assumptions, and beliefs individualize each theory when it is applied to nursing care. Theoretical frameworks of nursing provide a focus for nursing care activities. The person receiving care is the central theme, but the way each theorist defines that person, the environment, health, and nursing gives a unique focus specific to a particular theory. The ultimate goal of each framework is holistic patient care, individualized to meet needs, promote health, and prevent or treat illness. Selected theories of nursing are outlined in Table 2-2 (on pages 36–37) and in an appendix in *Nursing: Scope and Standards of Practice*, 4th ed (ANA, 2021).

Common Concepts in Nursing Theories

Four concepts common in nursing theory that influence and determine nursing practice are (1) the person (patient), (2) the environment, (3) health, and (4) nursing. Each of these concepts is usually defined and described by a nursing theorist, and although these concepts are common to all nursing theories, both the definitions and the relations among them may differ from one theory to another. Of the four concepts, the most important is that of the person. The focus of nursing, regardless of definition or theory, is the person (Fig. 2-1).

FIGURE 2-1. Four concepts common to all nursing theories are person, environment, health, and nursing. The most important concept, and the focus of nursing, is the person. (*Source:* From Eliopoulos, C. [2013]. *Gerontological nursing* [8th ed.]. Wolters Kluwer. *Photo by Rick Brady*.)

Table 2-2 Selected Theorists and Theories of Nursing

NURSING THEORIST AND DATE OF THEORY	CENTRAL THEME	APPLICATION TO CLINICAL PRACTICE

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Florence Nightingale (1860)	Meeting the personal needs of the patient within the environment.	Concern for the environment of the patient, including cleanliness, ventilation, temperature, light, diet, and noise.
Hildegard Peplau (1952)	Nursing is a therapeutic, interpersonal, and goal-oriented process.	Nursing interventions are directed toward developing the patient's personality for productive personal and community living.
Virginia Henderson (1955)	The patient is a person who requires help to reach independence.	Nursing practice is independent; autonomous nursing functions are identified, and self-help concepts are described.
Faye Abdullah (1960)	Nursing is a problem-solving art and science used to identify the nursing problems of patients as they move toward health and cope with illness-related health needs.	The 21 nursing-care problems identified were based on research and can be used to determine patient needs and formulate nursing-focused care.
Ida Jean Orlando (1961)	The nurse reacts to the patient's verbal and nonverbal expression of needs both to understand the meaning of the distress and to know what is needed to alleviate it.	Uses the nursing process to provide solutions to problems as well as to prevent problems.
Ernestine Wiedenbach (1964)	Nursing as an art; nursing is providing nurturing care to patients.	Clinical nursing includes a philosophy, a purpose, the practice, and the art. Care is directed toward a specific purpose to meet the patient's perceived health care needs.
Lydia E. Hall (1966)	Focus is on rehabilitation, encompassing nursing's autonomy, the therapeutic use of self, treatment within the health care team (cure), and nurturing (care).	The major outcome of nursing care is rehabilitation and feelings of self-actualization by the patient.
Myra E. Levine (1967)	Emphasis is on the ill person in the health care setting; describes detailed nursing skills and actions.	The patient is the center of nursing activities, with nursing care provided based on four conservation principles to help patients adapt to their environment.
Martha Rogers (1970)	Emphasis is on the science and art of nursing, with the unitary human being central to the discipline of nursing.	Nursing interventions are directed toward repatterning human environment fields or assisting in mobilizing inner resources.
Dorothea Orem (1971)	Self-care is a human need; self-care deficits require nursing actions.	Nursing is a human service, and nurses design interventions to provide or to manage self-care actions for sustaining health or recovering from illness or injury.
Imogene King (1971)	The patient is a personal system within a social system; the nurse and the patient experience each other and the situation, act and react, and transact.	Nursing is a process of human interactions as nurses and patients communicate to mutually set goals, and explore and agree on the means to reach those goals.

Betty Newman (1972)	Humans are in constant relationship with stressors in the environment.	The major concern for nursing is keeping the patient's system stable through accurately assessing the effects of environmental stressors and assisting the patient with adjustments required for optimal wellness.
Sister Callista Roy (1974)	Humans are biopsychosocial beings existing within an environment. Needs are created within interrelated adaptive modes: physiologic self-concept, role function, and interdependence.	Nursing interventions are required when people demonstrate ineffective adaptive responses.
Madeleine Leininger (1978)	Caring is the central theme of nursing care, knowledge, and practice.	This provides the foundation of transcultural nursing care. Caring improves human conditions and life processes.
Jean Watson (1979)	Nursing is concerned with promoting and restoring health, preventing illness, and caring for the sick.	Clinical nursing care is holistic to promote humanism, health, and quality of living. Caring is universal and is practiced through interpersonal relationships.
Margaret A. Newman (1979)	Nursing interventions are purposeful, using a total-person approach to patient care to help people, families, and groups attain and maintain wellness.	Nursing care is directed toward reducing stress factors and adverse conditions that increase the risk for or actually affect optimal patient functions.
Dorothy E. Johnson (1980)	Nursing problems arise when there are disturbances in the system or subsystem, or the level of behavioral functioning is below an optimal level.	Nursing interventions are designed to support/maintain health, educate, counsel, and modify behavior.
Rosemarie Parse (1981)	The person continually interacts with the environment and participates in maintaining health.	Health is a continual, open process (rather than an absence of illness), with nursing care planned based on the patient's perspective of health and care.
Nola Pender (1982)	The goal of nursing is the optimal health of the person, with a focus on how people make health care decisions.	Factors significant to health-promoting behaviors include a person's beliefs about the importance of health and the perceived benefits of, and perceived barriers to, those behaviors. Participation in health-promoting behaviors is modified by one's demographic and biologic characteristics, interpersonal influences, and situational and behavioral factors.
Patricia Benner and Judith Wrubel (1989)	Nursing practice occurs within a context of caring and skill development. Caring is a common bond of people situated in a state of being that is essential to nursing.	They presented a systematic description of stages of nursing practice: novice, advanced beginner, competent, proficient, and expert.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Katherine Kolcaba (2003)	Patient comfort exists in three forms: relief, ease, and transcendence. If a patient is comfortable, they will feel emotionally and mentally better which will aid in recovery.	The role of the nurse is to assess a patient's comfort needs and create a nursing care plan to meet those needs.

Nursing Theory in Clinical Practice

As a discipline, nursing is increasingly defining its own independent functions and contributions to health care. The development and use of nursing theory provide autonomy (independence and self-governance) in the practice of nursing in many ways. Nursing theories are patterns that guide the thinking about, being, and doing of nursing (ANA, 2021). As nurses demonstrate that nursing care does indeed make a difference and that nursing services are valuable, the discipline becomes more independent. Having a body of knowledge specific to the discipline allows members to be viewed by others as experts; this, in turn, gives nurses authority to carry out actions. In addition, interventions carried out and based on sound rationales are trusted and respected.

Today, it has become even more necessary and important for nurses to demonstrate efficient, cost-effective, high-quality care within organized health care delivery systems. By practicing theory-based nursing combined with clinical reasoning and judgment skills, nurses are able not only to deliver care that meets those criteria but also to describe and document what it is they do. Professional nurses use theories from nursing and from the behavioral sciences to collect, organize, and classify patient data and to understand, analyze, and interpret patients' health situations. Theoretical concepts and theories guide all phases of the nursing process, including planning, implementing, and evaluating nursing care, while also describing and explaining desired responses to and outcomes of care.

The major concepts of a chosen model or theory guide each phase of the nursing process. The concepts serve as categories to guide the nurse in determining what information is relevant and should be collected to make assessments and to formulate nursing diagnoses. The concepts also suggest the appropriate types of nursing interventions and patient outcomes to be included in the care plan (refer back to Table 2-2 for the purpose and clinical application of selected nursing theories). It is important to realize that as the focus of nursing changes, so does the applicability of the concepts within a specific theory.

NURSING RESEARCH

Research most simply defined means to examine carefully or to search again. Research as scientific inquiry is a process that uses observable and verifiable information (**data**), collected in a systematic manner, to describe, explain, or predict events. Research is conducted to validate and refine current knowledge or to develop new knowledge. The goals of research are to develop explanations (in theories) and to find solutions to problems.

Consider **Rachel Whang**, the daughter who is being taught how to give tube feedings and is asking about ensuring proper tube placement. The nurse would recommend the best method to use based on scientific evidence from research.

Nursing research, broadly defined, encompasses research to improve the care of people in the clinical setting as well as the broader study of people and the nursing profession, including studies of education, policy development, ethics, and nursing history. Research is included as an essential component of nursing by the ANA (2021), by the International Council of Nurses, and by nursing specialty organizations. Be sure to check ANA's *Nursing: Scope and Standards of Practice*, 4th ed (ANA, 2021) to become familiar with the expected competencies for scholarly inquiry.

> Research-focused nurses engage in the science of nursing and spirit of inquiry by designing, implementing, and evaluating research studies directed to the generation of new knowledge to improve and reform nursing practice and the systems in which nursing practice occurs. They conduct research directed to specific and salient nursing practice phenomena and serve as a leader in integrating research findings into the practice of nursing (ANA, 2021, p. 31).

The ANA Code of Ethics for Nurses (2015) counsels that all nurses must participate in the advancement of the profession through knowledge development, evaluation, dissemination, and application to practice. Nurses engage in **scholarly inquiry** in order to expand the body of knowledge that forms and advances the theory and practice of the discipline in all its spheres. One of the many ways to promote nursing's development of greater autonomy and strength is nursing research. Nurses, depending on their level of education, conduct or participate in research to improve their efforts to deliver high-quality, cost-efficient care. Nurses also increasingly use the findings of research to provide evidence-based nursing practice (discussed in the next section).

Nursing research is fundamental to the recognition of nursing as a profession. As an occupation, nursing has existed since the beginning of human history. One of the essential elements that differentiate a profession from an occupation is the existence of a unique and distinct knowledge base. The ultimate goal of expanding nursing's body of knowledge is to learn improved ways to promote and maintain health. As health care and illness patterns change, nursing interventions must change. Ongoing practice-based research reflects the nursing profession's commitment to meet the ever-changing demands of health care consumers.

Remember **Joe Wimmer**, the new father described at the beginning of the chapter. Before responding to Mr. Wimmer, the nurse would need knowledge of newborn heat loss and methods to minimize it. A review of the literature would provide theoretical information necessary to explain the scientific rationale for using caps on the heads of newborns to reduce heat loss.

Evolution of Nursing Research

While caring for victims of the Crimean War, Florence Nightingale kept careful and objective records. These records provided baseline data that she later used to determine which nursing interventions were most effective in treating her patients.

Although nurses have always provided care through nursing interventions and have evaluated the response of the patient, for a long time those interventions were primarily based on a philosophy of "It's always been done that way." As advances were made in technology and medical research during the 20th century, nursing leaders realized that research about the practice of nursing was necessary to meet the health needs of modern society. Increasing numbers of nurses began to conduct research and publish articles telling other nurses how to conduct nursing research.

During the 1950s and 1960s, nursing research was increasingly recognized as important. The first issue of *Nursing Research* was published in 1952. Early studies provided the basis for the development of nursing practice standards and the most effective educational preparation for registered nurses. The ANA sponsored a series of nursing research conferences. A focus on clinical studies to examine quality of care and the development of outcomes of care grew out of the newly developed intensive care units (ICUs).

The 1970s and 1980s focused on clinical research, with published studies of clinical interventions, such as vital signs and treatment procedures. Primary patient care was a popular method of nursing care, with research investigating outcomes and quality of care. The nursing process also was studied, with research into assessment and effective nursing diagnosis of patient responses to the effects of illness. Studies of nursing education were concerned with student learning experiences and clinical evaluation methods, as well as differentiation of practice by educational preparation. In addition, models, conceptual frameworks, and theories were developed to guide nursing practice. More nurses were prepared at the master's and doctoral levels, and federal funding for nursing research increased. Journals specific to nursing research (both generally and in specialty areas) were published.

Of major importance was the ANA's 1985 creation of the National Center for Nursing Research, which was subsequently promoted to the National Institute of Nursing Research (NINR) in 1993, thereby gaining equal status with the other 27 National Institutes of Health. The NINR website funds research that establishes the scientific basis for quality patient care. According to the NINR, the goals of nursing research are to:

- Build the scientific foundation for clinical practice
- Prevent disease and disability
- Manage and eliminate symptoms caused by illness
- Enhance end-of-life and palliative care

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

In September 2016, NINR released its new Strategic Plan: Advancing science, improving lives: A vision for nursing science. The new Strategic Plan describes four areas of scientific focus:

. Symptom science: promoting personalized health strategies
. Wellness: promoting health and preventing illness
. Self-management: improving quality of life for people with chronic conditions
. End-of-life and palliative care: the science of compassion

An additional two areas were deemed of high priority across all of NINR's scientific programs: (1) Promoting innovation: technology to improve health and (2) 21st-century nurse scientists: innovative strategies for research careers (Grady, 2017).

The NINR website offers a series of Featured Research Highlights, which summarize the recent work of NINR-supported researchers across the country. Box 2-2 provides an example of one of these Research Highlights. Be sure to visit the NINR website to explore featured resources: Palliative Care: Conversations Matter, NINR Director's Lecture Series, Stories of Discovery, Grant Programs Supported by NINR, NINR Strategic Plan and Research Highlights.

Box 2-2 **National Institute of Nursing Research (NINR): Featured Research Highlights**

Program That Can Provide Long-Term Physical and Mental Health Improvement Among Adolescents

- Being overweight or obese or having depressive symptoms can interfere with health and academic performance among young people, yet the number of overweight and obese young people has increased in recent years.
- To help find the best way to address weight and depression among teens, scientists tested the long-term effectiveness of the COPE (Creating Opportunities for Personal Empowerment) Healthy Lifestyles TEEN (Thinking, Emotions, Exercise, Nutrition) program.
- The COPE Healthy Lifestyles TEEN program, which involves teacher-led physical activity and positive behavioral skills training, was compared with an attention control program, Healthy Teens. The interventions were presented as part of required health classes in 11 high schools. In all, 779 students aged 14 to 16 participated in the study.

Researchers measured the two programs' effects on overweight and obesity, as well as depressive symptoms, at 12 months following the interventions. After these 12 months, students participating in the COPE Healthy Lifestyles TEEN program had lower body mass index than those participating in the Healthy Teens program. None of those in the COPE Healthy Lifestyles TEEN intervention became obese, and only about 5% moved from a healthy weight to overweight, whereas 10% of those in the Healthy Teens control group moved into overweight or obesity. Among the subgroup of participants with severely elevated depressive symptoms, participants in the COPE Healthy Lifestyles TEEN group improved after 12 months, while depressive symptoms in the Healthy Teens group remained elevated. The researchers concluded that the COPE Healthy Lifestyles TEEN program may help at-risk youth improve their physical and mental health. They also note that the program was delivered by teachers as part of their curriculum, making it easily available to students who may need it the most.

Methods of Conducting Nursing Research

Nursing research is conducted by quantitative and qualitative methodology. Each method is summarized here to help you understand published research so that findings may be used in your clinical practice.

Quantitative Research Methods

Quantitative research involves the concepts of basic and applied research. Box 2-3 provides definitions of important terms for quantitative research. **Basic research**, sometimes called pure or laboratory research, is designed to generate and refine theory, and the findings are often not directly useful in practice. **Applied research**, also called practical

research, is designed to directly influence or improve clinical practice.

Box 2-3 Important Terms in Quantitative Research

- **Variable:** Something that varies and has different values that can be measured
- **Dependent variable:** The variable being studied, determined as a result of a study
- **Independent variable:** Causes or conditions that are manipulated or identified to determine the effects on the dependent variable
- **Hypothesis:** Statement of relationships between the independent and dependent variables that the researcher expects to find
- **Data:** Information the researcher collects from subjects in the study (expressed in numbers)
- **Instruments:** Devices used to collect and record the data, such as rating scales, pencil-and-paper tests, and biologic measurements. Instruments should be both reliable (produce the same results [data] on repeated use) and valid (test what they are supposed to test)

Table 2-3 Types of Quantitative Research

TYPE	PURPOSE
Descriptive Research	To explore and describe events in real-life situations, describing concepts and identifying relationships between and among events; often used to generate new knowledge about topics with little or no prior research
Correlational Research	To examine the type and degree of relationships between two or more variables; the strength of the relationship varies from a –1 (perfect negative correlation, in which one increases as the other decreases) to a +1 (perfect positive correlation, with both variables increasing or decreasing together)
Quasi-experimental Research	To examine cause-and-effect relationships between selected variables; often conducted in clinical settings to examine the effects of nursing interventions on patient outcomes
Experimental Research	To examine cause-and-effect relationships between variables under highly controlled conditions; often conducted in a laboratory setting

The types of quantitative research depend on the level of current knowledge about a research problem (Table 2-3). The steps of quantitative research are followed carefully, although they may be designed in different ways. Table 2-4 presents an overview of the basic steps of the quantitative research process. If you are already familiar with the steps in the nursing process you should be able to recognize the similarities.

Qualitative Research Methods

Qualitative research is a method of research conducted to gain insight by discovering meanings. At its core is the idea that reality is based on perceptions, which differ for each person and change over time. The research design follows many of the same steps as quantitative research but differs in that the researcher primarily analyzes words or narratives rather than numbers. Table 2-5 outlines and briefly describes the methods of qualitative research. Chicca (2020) offers a helpful introduction to qualitative nursing research.

Table 2-4 Steps of the Quantitative Research Process

STEP	DESCRIPTION
1. State the research problem	This is often stated as a question, which should be focused narrowly on the problem being studied. For example: “What is the optimal time for taking a rectal temperature with a digital thermometer?”
2. Define the purpose of the study	The purpose explains “why” the problem is important and what use the findings will be.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

3. Review-related literature	The literature review provides information about what is already known, as well as providing information about concepts and how the concepts have been measured. It also identifies gaps in knowledge that will be studied.
4. Formulate hypotheses and variables	Hypotheses are statements about two or more variables. Scientific hypotheses must be testable using variables that can be measured, manipulated, or controlled in a study.
5. Select the research design	The design is a carefully determined, systematic, and controlled plan for finding answers to the question of the study. This provides a "road map" for all aspects of the study, including how to collect and analyze the data.
6. Select the population and sample	The population is the group to be studied. The sample refers to specific people or events in the population from which data will be collected.
7. Collect the data	Sources of data may include people, literature, documents, and findings (e.g., from sources such as laboratory data or measurements of vital signs). Data may be collected from interviews, questionnaires, direct measurement, or examinations (such as physical or psychological tests).
8. Analyze the data	Statistical procedures are used to analyze the data and provide answers to the research question.
9. Communicate findings and conclusions	Through publications and presentations, the researcher explains the results of the study and links them to the existing body of knowledge in the literature. The researcher also describes the implications of the study and suggests directions for further research.

Protection of the Rights of Human Subjects

Many nurses work in health care institutions in which patients are invited to participate in clinical research. With their focus on the overall well-being of the patient, nurses play an important role in ensuring that patient interests are not sacrificed to research interests. Nursing priorities include determining that the studies have met appropriate scientific and ethical criteria before their implementation and protecting patient rights. Specific patient rights include **informed consent**, the patient's right to consent knowledgeably to participate in a study without coercion (knowing that this consent may be withdrawn at any time) or to refuse to participate without jeopardizing the care that they will receive, the right to confidentiality, and the right to be protected from harm. Nurse ethicist Christine Grady and her colleagues propose seven requirements that provide a coherent framework for evaluating the ethics of clinical research with human subjects (Emmanuel et al., 2000):

- Value: Enhancements of health or knowledge must be derived from the research.
- Scientific validity: The research must be methodologically rigorous.
- Fair subject selection: Scientific objectives, not vulnerability or privilege, and the potential for and distribution of risks and benefits, should determine communities selected as study sites and the inclusion criteria for individual subjects.
- Favorable risk–benefit ratio: Within the context of standard clinical practice and the research protocol, risks must be minimized and potential benefits enhanced, and the potential benefits to people and knowledge gained for society must outweigh the risks.
- Independent review: Unaffiliated people must review the research and approve, amend, or terminate it.
- Informed consent: People should be informed about the research and provide their voluntary consent.
- Respect for enrolled subjects: Subjects should have their privacy protected, the opportunity to withdraw, and their well-being monitored.

Federal regulations require that institutions receiving federal funding or conducting studies of drugs or medical devices regulated by the Food and Drug Administration establish institutional review boards (IRBs). The IRBs review all studies conducted in the institution to determine the risk status of all studies and to ensure that ethical principles are followed (Marzinsky & Smith-Miller, 2019). See Chapter 6 for a full discussion of values and ethics in nursing.

Table 2-5 Qualitative Research Methods

METHOD	DESCRIPTION
Phenomenology	The purpose of phenomenology (both a philosophy and a research method) is to describe experiences as they are lived by the subjects being studied. Analysis of data provides information about the meaning of the experience within each person's own reality (e.g., the experience of health or of having a heart attack).
Grounded Theory	The basis of grounded theory methodology is the discovery of how people describe their own reality and how their beliefs are related to their actions in a social scene. The findings are grounded in the data from subjects and are used to formulate concepts and to generate a theory of the experience, supported by examples from the data (e.g., coping with a seriously ill child).
Ethnography	Developed by the discipline of anthropology, ethnographic research is used to examine issues of a culture that are of interest to nursing.
Historical	Historical research examines events of the past to increase understanding of the nursing profession today. Many historical studies focus on nursing leaders, but there is increasing interest in the historical patterns of nursing practice.

The National Cancer Institute (NCI) offers an online training tutorial (with a certificate) titled, "Protecting Human Research Participants." You can access the tutorial on NCI's website, https://phrp.nihtraining.com/users/login.php. You will also find helpful resources on the Office for Human Research Protections (OHRP) website, http://www.hhs.gov/ohrp.

Application of Research to Practice

Younas (2020) defines **research utilization (RU)** as a process of transforming research knowledge into practice, with knowledge referring to both conducting and analyzing research. It enables nurses to improve patient care by informing practice on interventions that may no longer be useful. Despite the clinical and practical importance of research, studies have indicated that nurses seldom use it to guide practice. Instead, they rely on personal experience, peer support, and trial and error (p. 63). The most common impediments to nursing research include restricted access to resources, limited time to participate in research-related activities, and lack of educational preparation needed by nurses for research. Research about nursing education, administration, and practice all affect patient care directly or indirectly. Too often, practicing nurses mistakenly think research is far removed from caring for patients at the bedside. This false impression has slowed the progress of practice-based nursing research. Yet much of what bedside nurses routinely do constitutes research. The nursing process (i.e., assessing, diagnosing/problem identification, planning, implementing, and evaluating) represents the basic framework of the research process.

Summarizing research about why the adoption of EBP in nursing has been sluggish, Ost et al. (2020) identify the most frequent barriers in EBP implementation as inadequate knowledge and skills, a lack of experienced mentors to facilitate the process, and the perception that implementing EBP is too time-consuming. "Overcoming these barriers is essential because the provision of support and resources to implement EBP has been reported to result in improved quality of care, lower costs, and better patient outcomes," (p. 59)—things we all value!

QSEN EVIDENCE-BASED PRACTICE (EBP)

Nurses who value the concept of EBP as integral to determining best clinical practice regularly read relevant professional journals to keep their practice up to date. They similarly value the need for continuous improvement in clinical practice based on new knowledge.

Unless the research findings of nurse researchers are used by practicing nurses to improve the quality of patient care, clinical nursing research is useless. Nursing students developing clinical skills must understand the scientific rationale that makes one course of action preferable to another. Throughout this text, Research in Nursing boxes highlight current studies that have the potential to make a positive difference in nursing practice and patient outcomes.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

EVIDENCE-BASED PRACTICE

Nurses make decisions about many different aspects of patient care each day. For example, questions for consideration range from, "What site should I use to take an infant's temperature?" to "How can I move my patient in bed to decrease complications and promote safety?" Patient safety and health may be adversely affected unless the most current best evidence is used to answer questions and make clinical decisions. When frontline caregivers began to see critically ill patients with COVID-19 in their emergency rooms and critical care units, what initially complicated their treatment and care was the lack of knowledge about how to effectively treat these patients, their disease, and their symptoms. Patient outcomes improved as professionals quickly shared what they were learning, but everyone was eager for the research to support best practice.

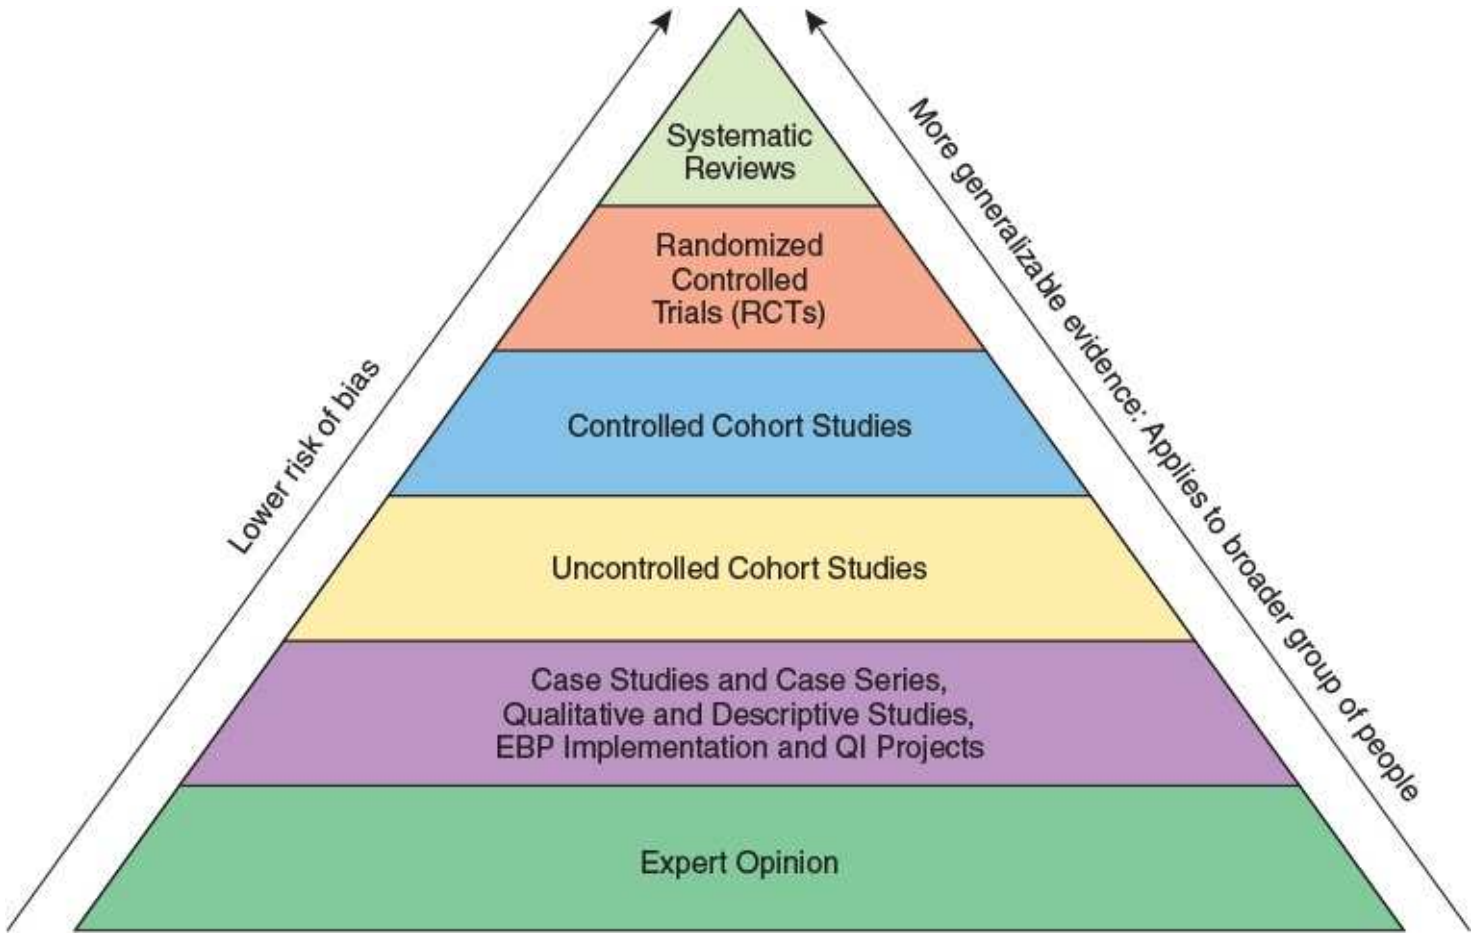

FIGURE 2-2. Hierarchy of evidence for intervention questions. (*Source:* Adapted from Melnyk, B. M., & Fineout-Overholt, E. [2015]. *Evidence-based practice in nursing: A guide to best practice* [3rd ed., p. 92]. Wolters Kluwer Health. Used with permission.)

Evidence-based practice (EBP) in nursing is a problem-solving approach to making clinical decisions, using the best evidence available (considered "best" because it is collected from sources such as published research, national standards and guidelines, and reviews of targeted literature). See Figure 2-2 for a hierarchy of evidence.

Makic and Rauen (2016) identify essential elements of EBP as (1) the integration of best research and other forms of evidence to guide practice; (2) viewing clinical expertise as a component in care effectiveness; and (3) considering patients' preferences, values, and engagement in care decisions as essential to providing optimal evidence-based care to patient and their families (Fig. 2-3).

The information that is collected is analyzed and used to answer questions (the science of nursing), taking into consideration patient preferences and values, as well as the clinical experiences of the nurse (the art of nursing). EBP may consist of specific nursing interventions or may use guidelines established for the care of patients with certain illnesses, treatments, or surgical procedures.

Implementing EBP in clinical practice can present multiple challenges. Resistance to using EBP may arise in the current health care setting as a result of the nursing shortage, the acuity level of patients, nurses' skill in reading and evaluating published research, and an organizational culture that does not support change. Other factors include insufficient time to implement new ideas; insufficient time to read research; lack of authority to change patient care procedures; lack of support from physicians, managers, and other staff members; and inadequate infrastructure support, such as libraries and ethics committees (Yoder et al., 2014). However, to achieve desired outcomes for quality patient care and to demonstrate clinical nursing effectiveness, it is critical that nurses gain the necessary knowledge and skills to provide the best possible nursing care. The practice settings in which nurses work must support changes made based on EBP. The changes may be implemented by an individual nurse, by groups of nurses working together, or by interdisciplinary teams of health care providers.

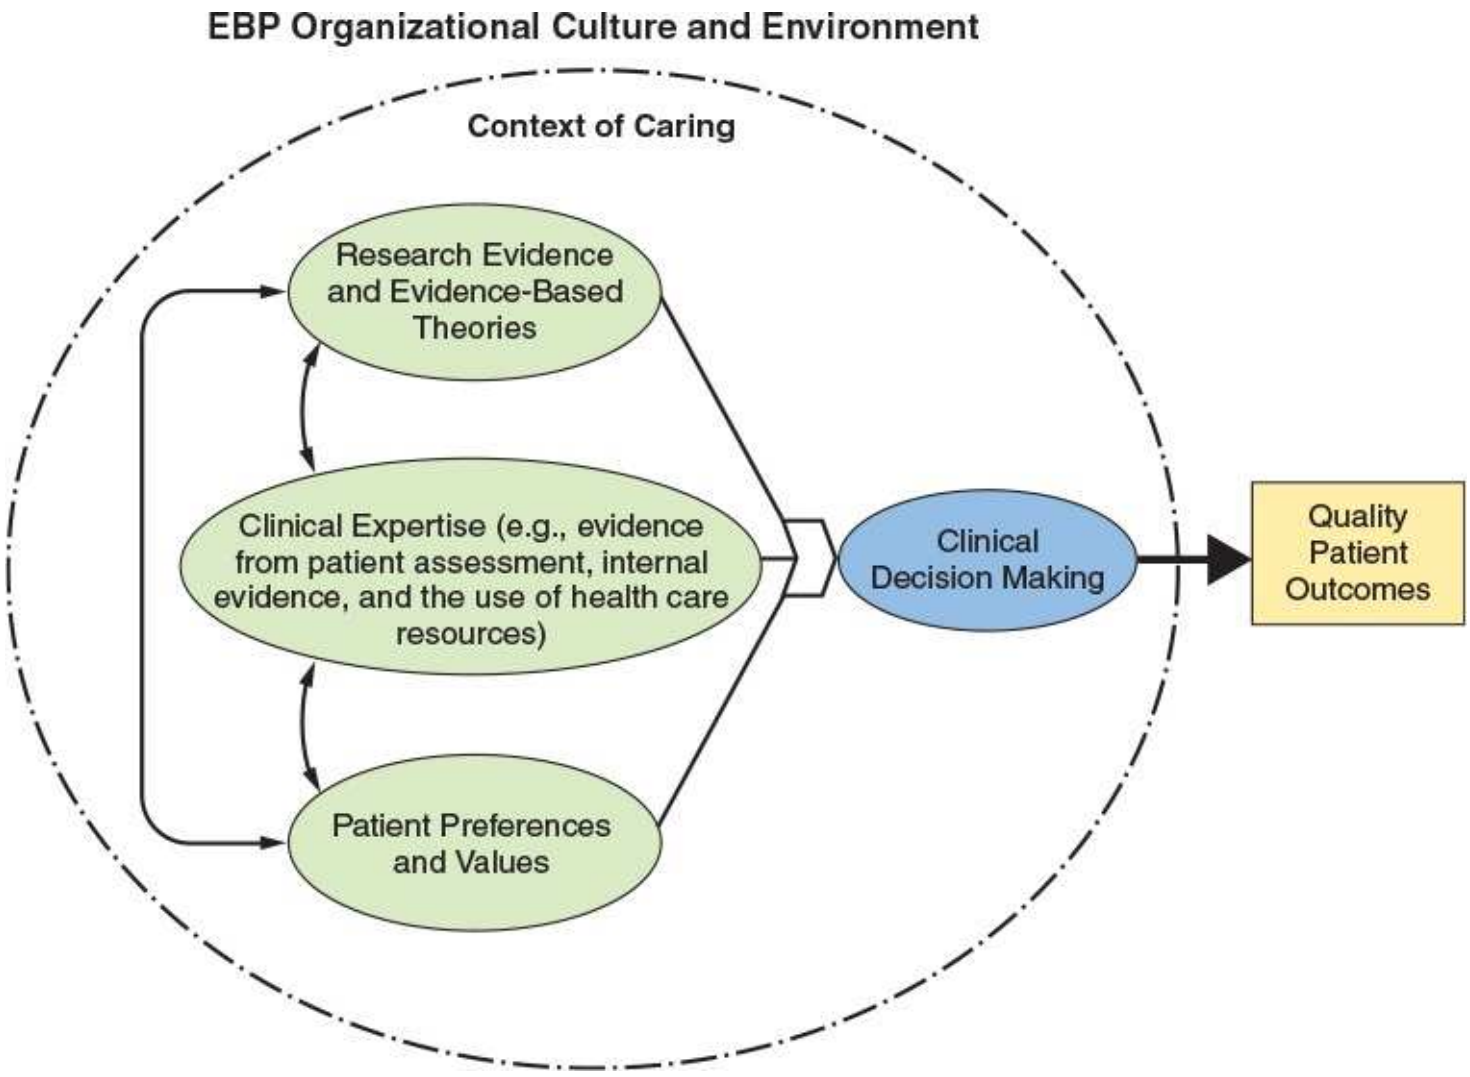

FIGURE 2-3. The merging of science and art: Evidence-based practice (EBP) within a context of caring and an EBP culture and environment results in the highest quality of health care and patient outcomes. (*Source:* From Melnyk, B. M., & Fineout-Overholt, E. [2015]. *Evidence-based practice in nursing: A guide to best practice* [3rd ed., p. 5]. Wolters Kluwer Health. Used with permission.)

Unfolding Patient Stories: Sara Lin • Part 1

Sara Lin, an 18-year-old female, returned from the recovery room to the medical-surgical unit following an appendectomy. An intravenous (IV) line and indwelling urinary catheter were placed in the operating room. Sara is awake and can begin oral fluids and advance activity, as tolerated. The nurse reviews the provider's orders and confirms the continuation of the IV for fluids and antibiotics. How does evidence-based practice support the nurse's clinical decision to contact the provider for an order to discontinue the urinary catheter? (Sara Lin's story continues in Chapter 19.)

Care for Sara and other patients in a realistic virtual environment: *vSim for Nursing*. (thepoint.lww.com/vSimFunds). Practice documenting these patients' care in DocuCare (thepoint.lww.com/DocuCareEHR).

Johns Hopkins Nursing Evidence-Based Practice Model

The Johns Hopkins Nursing Evidence-Based Practice (JHNEBP) model is a powerful problem-solving approach to clinical decision making and is accompanied by user-friendly tools to guide individual or group use. It is designed specifically to meet the needs of the practicing nurse and uses a three-step process called PET: practice question, evidence, and translation (Fig. 2-4 on page 44). The goal of the model is to ensure that the latest research findings and best practices are quickly and appropriately incorporated into patient care. Check the Johns Hopkins Medicine website for helpful tools: http://www.hopkinsmedicine.org/evidence-based-practice/jhn_ebp.html.

Rationale for Using Evidence-Based Practice

The impetus for EBP is based on the IOM report (2001) *Crossing the Quality Chasm: A New Health System for the 21st Century*, which challenged health care professionals to provide care based on scientific evidence. In addition, those interested in quality and cost control want evidence that the services and interventions being funded or reimbursed are effective in securing valued goals.

Until the mid-1990s, many large hospitals had research utilization departments directed by doctoral-prepared nurse scientists. These departments conducted research within the hospital to answer clinical practice questions and used the research findings to dictate practice changes. Today, few hospitals use findings from their own research to direct clinical

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

nursing practice. As a result of recent advances in information technology, findings from published literature can be found, analyzed, and applied to answer clinically relevant questions. Key databases and search engines may be easily accessed on most work computer stations as well as home computer systems. Many research articles in journals and guidelines developed by expert panels can be downloaded, read, evaluated, and shared with colleagues.

Therefore, the use of EBP mandates the analysis and systematic review of research findings. The first step for you as a student is to be able to read and understand a research article. To help you, the typical format of a research journal article xwith a description of each part is outlined in Table 2-6. See also Box 2-4 for a helpful checklist to use when reading and critiquing a research article.

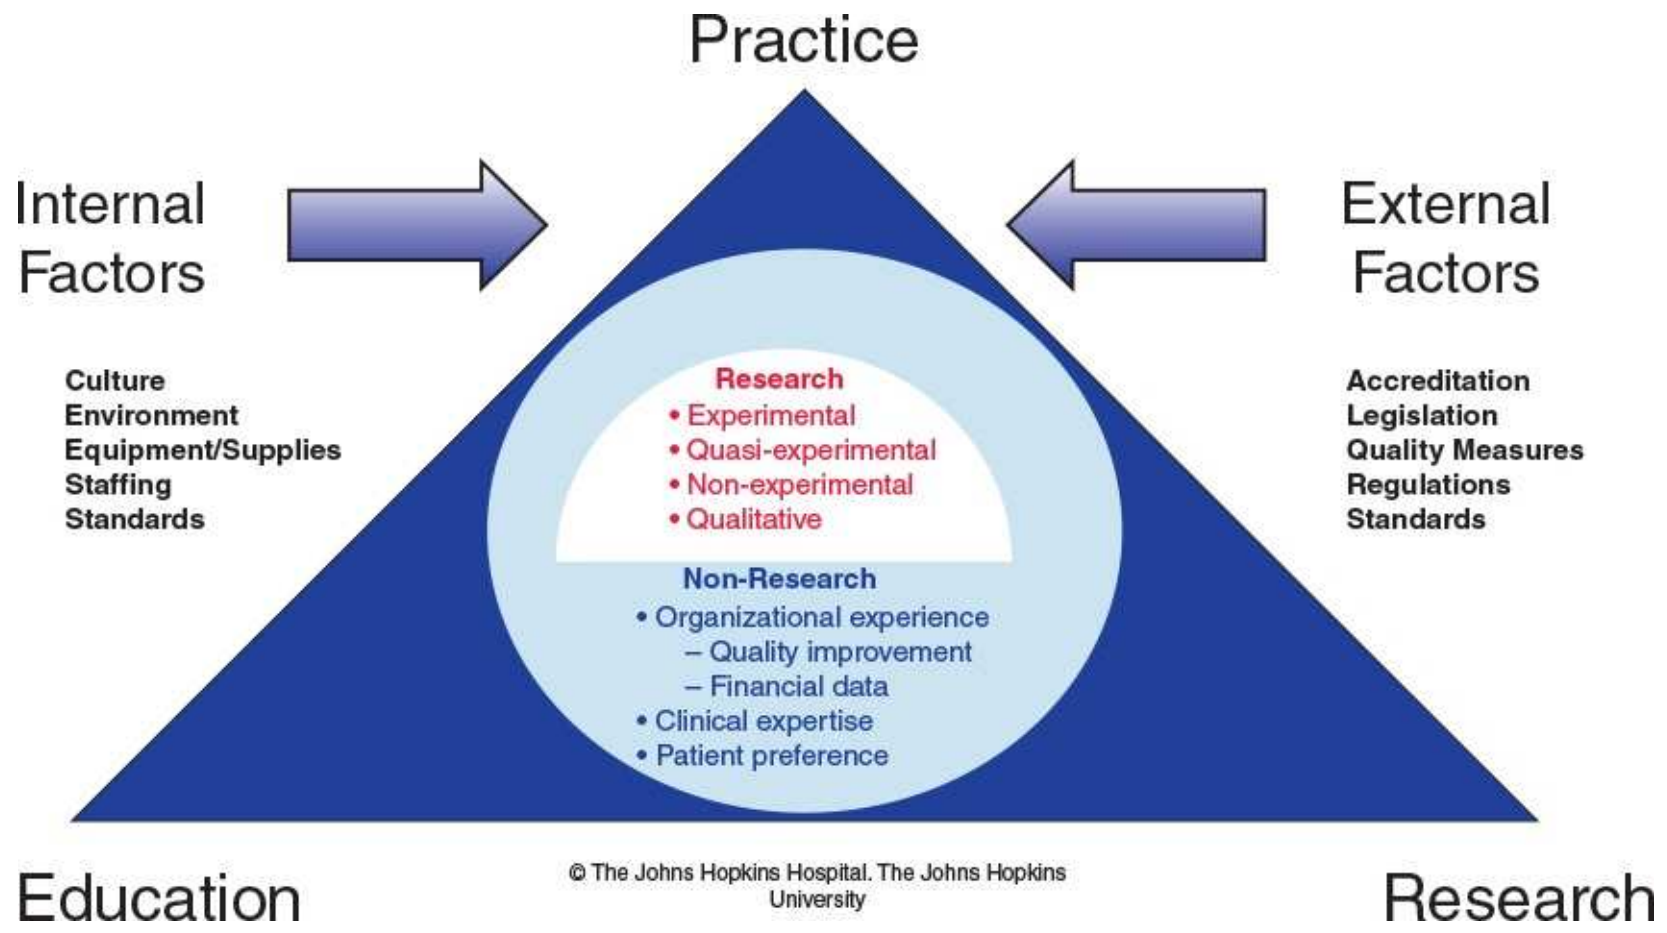

FIGURE 2-4. The Johns Hopkins Nursing Evidence-Based Practice model is a powerful problem-solving approach to clinical decision making and is accompanied by user-friendly tools to guide individual or group use. It is designed specifically to meet the needs of the practicing nurse and uses a three-step process called PET: practice question, evidence, and translation. The goal of the model is to ensure that the latest research findings and best practices are quickly and appropriately incorporated into patient care. (*Source:* From John Hopkins Medicine Center for Evidence-Based Practice. Used with permission. © The Johns Hopkins Hospital/The Johns Hopkins University.)

Steps of the Evidence-Based Practice Process

To practice EBP, nurses carry out the following six steps (Melnyk & Fineout-Overholt, 2019).

Step 1: Formulate the burning clinical question. There are several different methods that can be used to ask clinical questions. The most common method is the PICOT format, described in Table 2-7. See the accompanying PICOT in Practice, for a sample of the development of a clinical question using PICOT and the EBP decision-making process; additional samples are found in selected chapters of this book.

Table 2-6 Parts of a Research Journal Article

SECTIONS (IN USUAL ORDER)	DESCRIPTION
Abstract	The abstract is at the beginning of the article. It summarizes the entire article and usually provides the purpose of the study; a description of the subjects, data collection, and data analysis; and a summary of important findings.
Introduction • Review of the literature • Statement of the purpose	The literature review discusses relevant studies that have been conducted in the area of this study. A statement of the specific goals or purpose of the study often follows the review.
Method • Subjects • Design • Data collection • Data analysis	The methods section describes in detail how the study was conducted, including the type and number of subjects, the research design used, what data were collected and how, and the types of analysis done. There should be enough information so that the study could be replicated (repeated).

Results	The results (findings) are often presented both in words and in charts, tables, or graphs. It is important to understand what the results were and whether they are meaningful.
Discussion (Conclusions)	The discussion section reports what the results mean in regard to the purpose of the study and the literature review. It may also include suggestions for further research and application to nursing education or practice, as appropriate.
References	The references are at the end of the article and include a list of articles and books used by the researcher.

Box 2-4 Checklist for Reading and Critiquing a Research Article

1. Review the elements of the article.
   - Title describes the article.
   - Abstract summarizes the article.
   - Introduction makes the purpose clear.
   - Problem is properly introduced.
   - Purpose of the study is explained.
   - Research question(s) are clearly presented.
   - Theoretical framework informs the research.
   - Literature review is relevant and comprehensive and includes recent research.
   - Methods section details how the research questions were addressed or hypotheses were tested.
   - Analysis is consistent with the study questions and research design.
   - Results are clearly presented and statistics clearly explained.
   - Discussion explains the results in relation to the theoretical framework, research questions, and significance to nursing.
   - Limitations are presented and their implications discussed.
   - Conclusion includes recommendations for nursing practice, future research, and policymakers.
2. Determine the level and quality of the evidence using a scale (several can be found in ANA's Research Toolkit http://www.nursingworld.org/Research-Toolkit/Appraising-the-Evidence).
3. Decide if the study is applicable to your practice.

Source: From Kaplan, L. (2012). Reading and critiquing a research article. *American Nurse Today, 7* (10). Used with permission. Copyright © 2018, HealthCom Media. All rights reserved. *American Nurse Today*, October 2012.

Table 2-7 Asking Clinical Questions in PICOT Format

COMPONENTS	CONSIDERATIONS
P = Patient, population, or problem of interest	Need for explicit description; may include setting, limiting to subgroups (such as by age)
I = Intervention of interest	The more defined, the more focused the search of the literature will be; may include exposure, treatment, patient perception, diagnostic test, or predicting factor
C = Comparison of interest	Usually a comparison to another treatment or the usual standard of care
O = Outcome of interest	Specifically identifying the outcome to enable a literature search to find evidence that examined the same outcome, perhaps in different ways
T = Time	The time when the comparison of interest is completed and the outcome can be evaluated

Step 2: Search for the best evidence. It is important to collect information that is regarded as the strongest level of evidence. The level for strength of evidence is numerical, with level 1 being the strongest and level 7 the

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

lowest. The strongest ("best") evidence is provided by findings from systematic reviews, EBP guidelines, and meta-analyses. **Systematic reviews** summarize findings from multiple studies of a specific clinical practice question or topic and recommend practice changes and future directions for research. **Evidence-based practice guidelines** synthesize information from multiple studies and recommend best practices to treat patients with a disease (e.g., hypertension), a symptom (e.g., chronic pain), or a disability (e.g., cognitive impairment). These guidelines are typically written by a panel of experts. A *meta-analysis* uses statistical analysis of the effect of a specific intervention across multiple studies, providing stronger evidence than results from a single study. If systematic reviews, EBP guidelines, and meta-analyses are not available, collect reviews of descriptive or qualitative studies or articles of original quantitative studies listed in databases such as MEDLINE and CINAHL (Cumulative Index to Nursing and Allied Health Literature). Box 2-5 provides a suggested list of resources for collecting evidence.

PICOT in Practice

ASKING CLINICAL QUESTIONS: PRESSURE INJURY

Scenario: You are a staff nurse in a specialty long-term care facility for adult patients with spinal cord injuries. Patients admitted to your unit usually are young and have had injuries that resulted in tetraplegia. The patients are at risk for pressure injuries.

In a monthly staff meeting, you report that the incidence of pressure injuries on the unit in each of the most recent quarters was higher than it had been for any of the previous 12 quarters. The nurse manager notes that monies have been allocated in the current budget for purchase of new equipment as needs are identified. The nurse manager gives the staff information on a new type of low air loss alternating pressure mattress that is reported to be "more effective in preventing pressure injuries than the alternating pressure mattress overlays now being used." The nurse manager requests that the staff make a recommendation about purchase of the new pressure injury prevention mattress.

- **Problem:** Adults at risk for pressure injuries
- **Intervention:** Low air loss alternating pressure mattress
- **Comparison:** Alternating pressure mattress overlays
- **Outcome:** Incidence of pressure injuries
- **Time:** During admission to a long-term care facility

PICOT Question: Is the use of a low air loss alternating pressure mattress more effective than an alternating pressure mattress overlay in preventing pressure injuries among a population of patients with tetraplegia during admission to a long-term care facility?

Findings:

1. European Pressure Ulcer Advisory Panel, National Pressure Injury Advisory Panel and Pan Pacific Pressure Injury Alliance (2019). Prevention and Treatment of Pressure Ulcers/Injuries: Quick Reference Guide. http://www.internationalguideline.com/guideline

2. Nixon, J., Smith, I. L., Brown, S., McGinnis, E., Vargas-Palacios, A., Nelson, E. A., Coleman, S., Collier, H., Fernandez, C., Gilberts, R., Henderson, V., Muir, D., Stubbs, N., Walker, K., Wilson, L., & Hulme, C. (2019). Pressure Relieving Support Surfaces for Pressure Ulcer Prevention (PRESSURE 2): Clinical and Health Economic Results of a Randomized Controlled Trial. *EClinicalMedicine, 14,* 42–52.

Results of four high-quality systematic reviews reveal insignificant evidence to conclude superiority of one type of support surface over another. Guidelines across multiple organizations support that the use of support surfaces is not a stand-alone intervention for the prevention of pressure injuries. A pressure injury prevention program should include a routine assessment of skin, risk for pressure injuries, weight and mobility of patient, nutritional status, skin moisture, pressure redistribution when in bed and chair, repositioning, and patient and caregiver education.

Level of Evidence C: A body of evidence with inconsistencies that cannot be explained, reflecting genuine uncertainty surrounding the topic.
Strength of Recommendation: Weak positive recommendation: Probably do it.
Recommendations: Based on the staff's review of the literature, a recommendation NOT to buy the new pressure prevention mattress was made to the nurse manager.

In addition, the staff recommend that the current nursing protocol for prevention of pressure injuries be reviewed to assure that current evidence-based recommendations for assessment risk and non-support surface interventions were included. The decision about which support surface intervention to use should be evidence based and individualized to meet the needs for pressure redistribution for the right patient at the right time. The staff made the following recommendation based on the *Prevention and Treatment of Pressure Ulcers/Injuries Guide:*

1. Use a high specification reactive single-layer foam mattress or overlay in preference to a foam mattress without high specification qualities for individuals at risk of developing pressure injuries.
2. Assess the relative benefits of using a medical grade sheepskin for individuals at risk of developing pressure injuries.
3. For individuals with obesity, select a support surface with enhanced pressure redistribution, shear reduction and microclimate features.

Box 2-5 **American Association of Critical Care Nurses' Resources for Online Searches**

Systematic Reviews

A systematic review is a review of available research studies focusing on a single question. The systematic review summarizes, appraises, and synthesizes large bodies of evidence relevant to a focused research question.

- Cochrane Collaboration: www.cochrane.org
- Database of Abstracts of Reviews of Effectiveness (DARE): www.brad.ac.uk/library/elecinfo/dare.php
- Clinical Evidence: www.clinicalevidence.bmj.com
- The Joanna Briggs Institute (Library of Systematic Reviews): https://jbi.global/
- PubMed: www.ncbi.nlm.nih.gov/entrez/query/static/clinical.shtml#reviews
- National Health Service (NHS) Evidence Health Information Resources—Specialist Collections: https://library.hud.ac.uk/freeresources/helpsheets/NLHsummary.pdf

Guideline Database

Guideline databases are searchable databases of evidence-based clinical practice guidelines.

- U.S. National Guideline Clearinghouse: www.guideline.gov
- U.S. Agency for Healthcare Research and Quality: www.ahrq.gov
- New Zealand Guidelines Group: www.nzgg.org.nz
- Trip Database: www.tripdatabase.com
- National Institute for Health Care Excellence (NICE): https://www.evidence.nhs.uk
- Institute for Healthcare Improvement: www.ihi.org/IHI/topics
- Centers for Disease Control: www.cdc.gov/hai
- Australian National Health and Medical Research Council: https://www.nhmrc.gov.au/guidelines
- Michigan Quality Improvement Consortium Guidelines: www.mqic.org/guidelines.htm

Professional Organizations

Professional organizations often offer position statements, guidelines, protocols, and other documents to promote evidence-based practice.

- American Association of Critical Care Nurses: www.aacn.org
- Society of Critical Care Medicine: www.learnicu.org/Pages/Guidelines.aspx
- American College of Chest Physicians: https://www.chestnet.org/topic-collections/critical-care

Online Clinical Databases

These databases allow literature searches for primary sources of evidence and research.

- The Cumulative Index of Nursing and Allied Health Literature (CINAHL) is a comprehensive resource for nursing and allied health literature; https://www.ebsco.com/products/research-databases/cinahl-database or access through www.aacn.org
- MEDLINE is the U.S. National Library of Medicine's (NLM) database that references journal articles focused on biomedicine. It can be searched for free through PubMed: www.ncbi.nlm.nih.gov/pubmed

Journals

Professional journals may contain abstracts with expert commentaries. Here are some suggestions; others exist beyond this listing.

- *Evidence-Based Nursing*: www.ebn.bmj.com
- *Evidence-Based Medicine*: www.ebm.bmj.com
- *British Medical Journal's Clinical Evidence*: www.clinicalevidence.com
- *American Journal of Critical Care,* Clinical Pearls Section: http://ajcc.aacnjournals.org

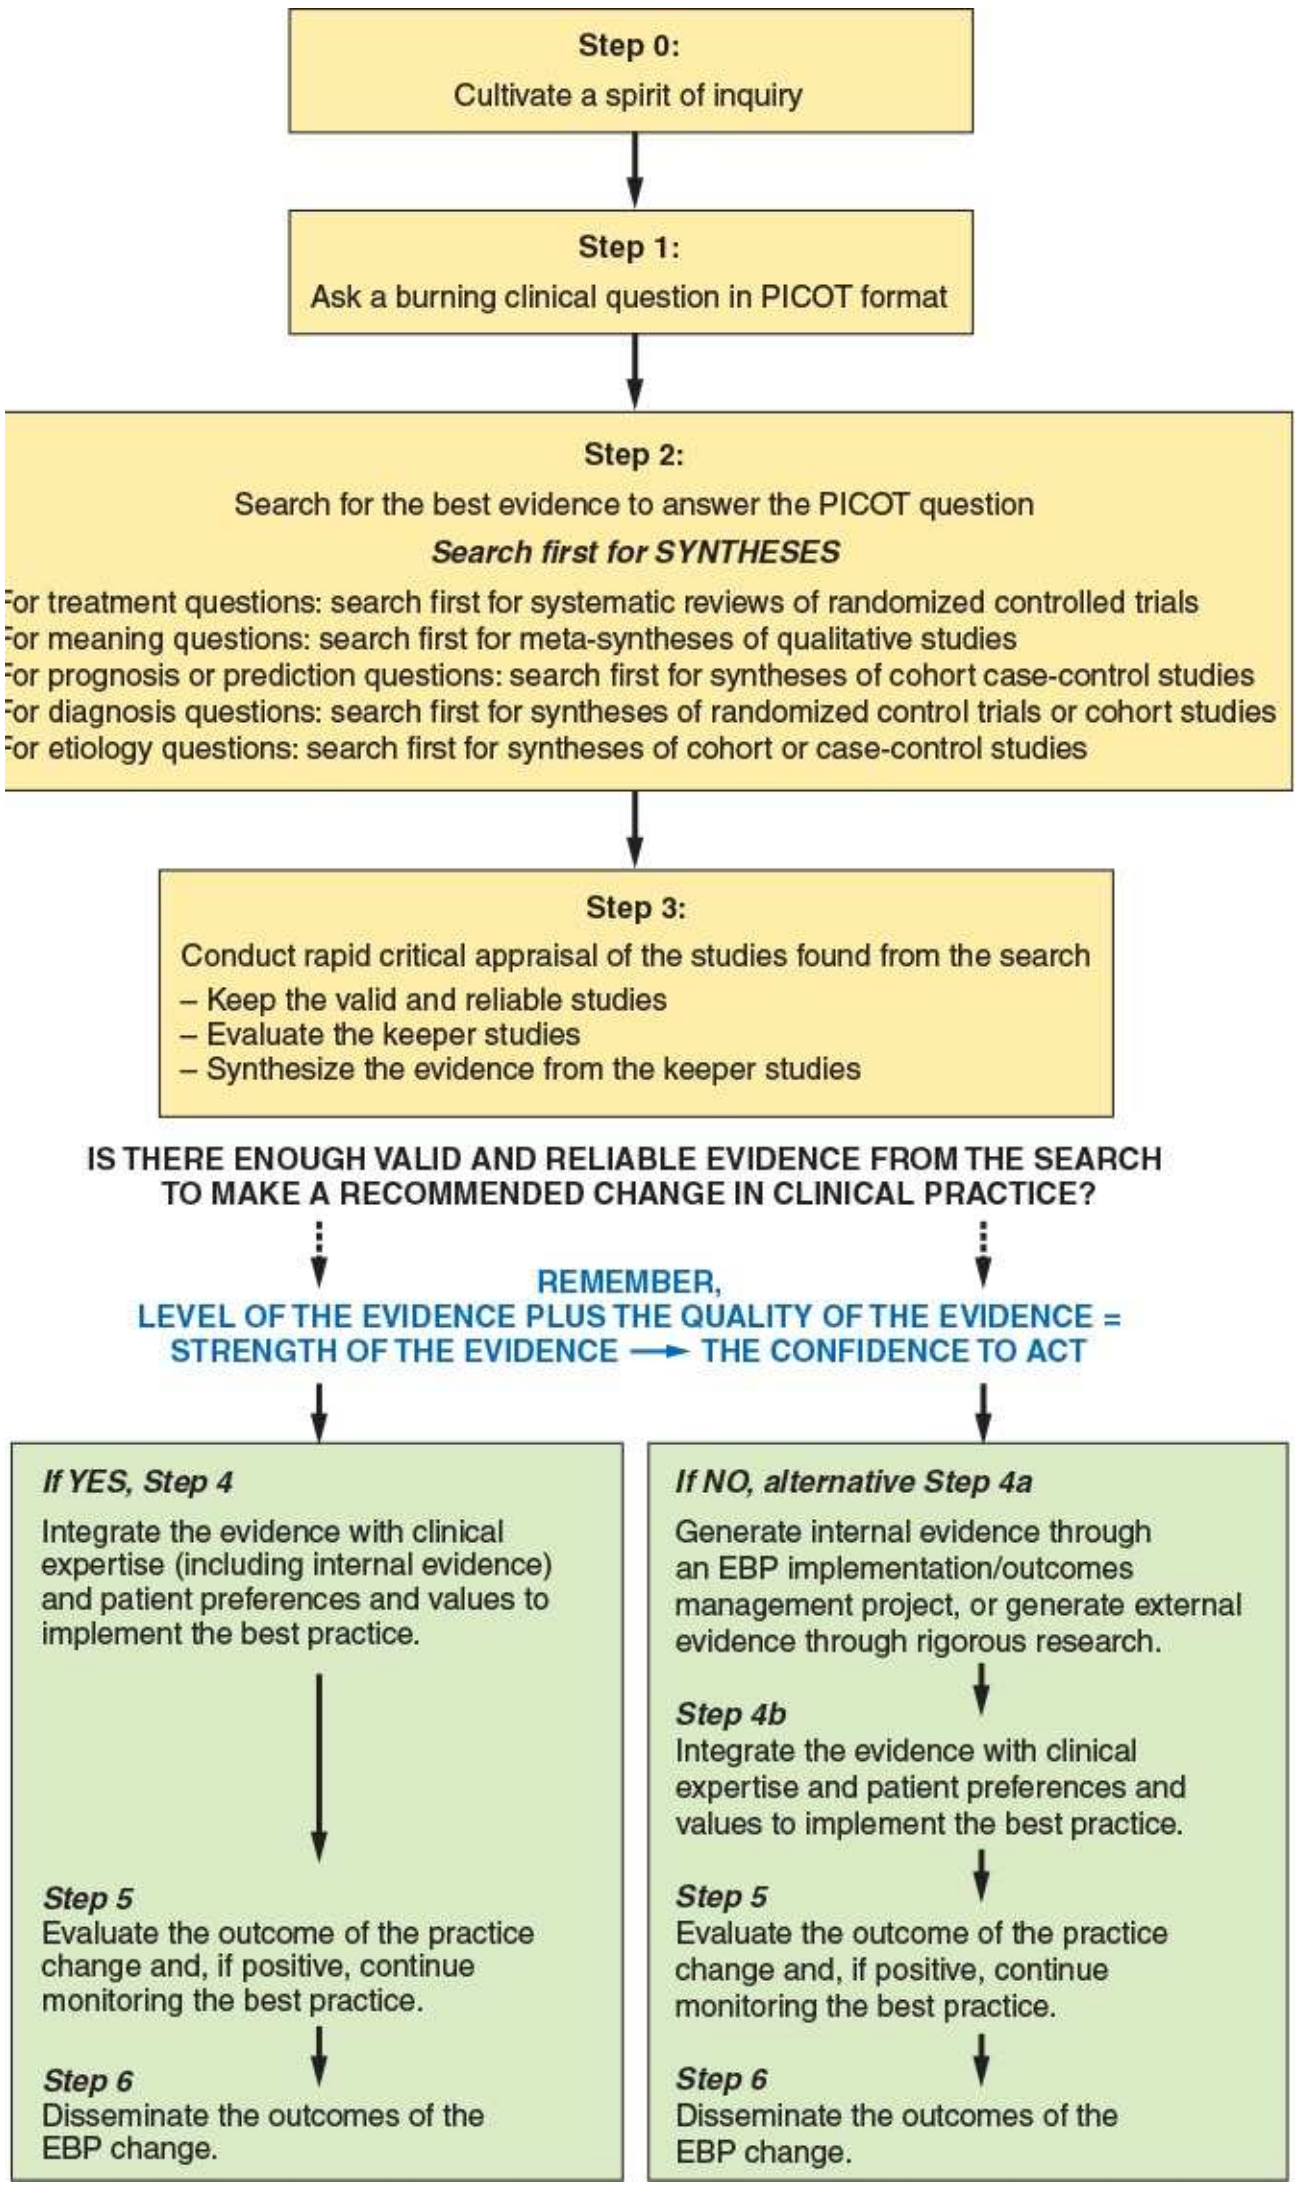

FIGURE 2-5. Steps of the evidence-based practice process leading to high-quality health care and best patient outcomes. (*Source:* From Melnyk, B. M., & Fineout-Overholt, E. [2015]. *Evidence-based practice in nursing: A guide to best practice* [3rd ed., p. 15]. Wolters Kluwer Health. Used with permission.)

Step 3: Critical appraisal of evidence. Ask three questions: (1) Are the results of the study valid (validity)? (2) What are the results (reliability)? (3) Will the results help me in caring for my patients (applicability)?

Step 4: Integrate the evidence with clinical expertise and patient/family to make the best clinical decision. Patients want to be involved in decision making about their care; if evidence is found to support a change but the patient does not want it, the change should not occur. If the change that is proposed cannot be applied in a practical sense, or is too costly or too risky, then the change should also not occur. For example, the most reliable method to determine if a nasogastric tube is correctly placed is by x-ray examination. However, this method of verification is costlier and riskier to the patient (i.e., through exposure to radiation) than other methods; therefore, it is not considered the preferred method in many situations.

Step 5: Evaluate the outcomes of the practice change based on evidence. The evaluation step is essential to

determining if the change is effective for a particular patient or setting and if the expected outcomes resulted from the change.

Step 6: Disseminate the outcomes of the EBP change. It is important for nurses and the patients they care for to implement EBP in their clinical practice. In doing so, patients, health care professionals, and health care systems will be able to place more confidence in the care that is being delivered and know the best outcomes for patients and their families are being achieved (Melnyk & Fineout-Overholt, 2019).

EBP blends both the science and the art of nursing so that the best patient outcomes are achieved (Fig. 2-5 on page 47).

QUALITY IMPROVEMENT

In health care, we value research that generates new knowledge to improve the quality of the care patients experience. The Health Resources and Services Administration (HRSA) defines **quality improvement (QI)** as systematic and continuous actions that lead to measurable improvement in health care services and the health status of targeted patient groups. Not surprisingly HRSA notes that an important measure of quality is the extent to which patients' needs and expectations are met. Services that are designed to meet the needs and expectations of patients and their communities include:

- Systems that affect patient access
- Care provision that is evidence based
- Patient safety
- Support for patient engagement
- Coordination of care with other parts of the larger health care system
- Cultural competence, including assessing health literacy of patients, patient-centered communication, and linguistically appropriate care

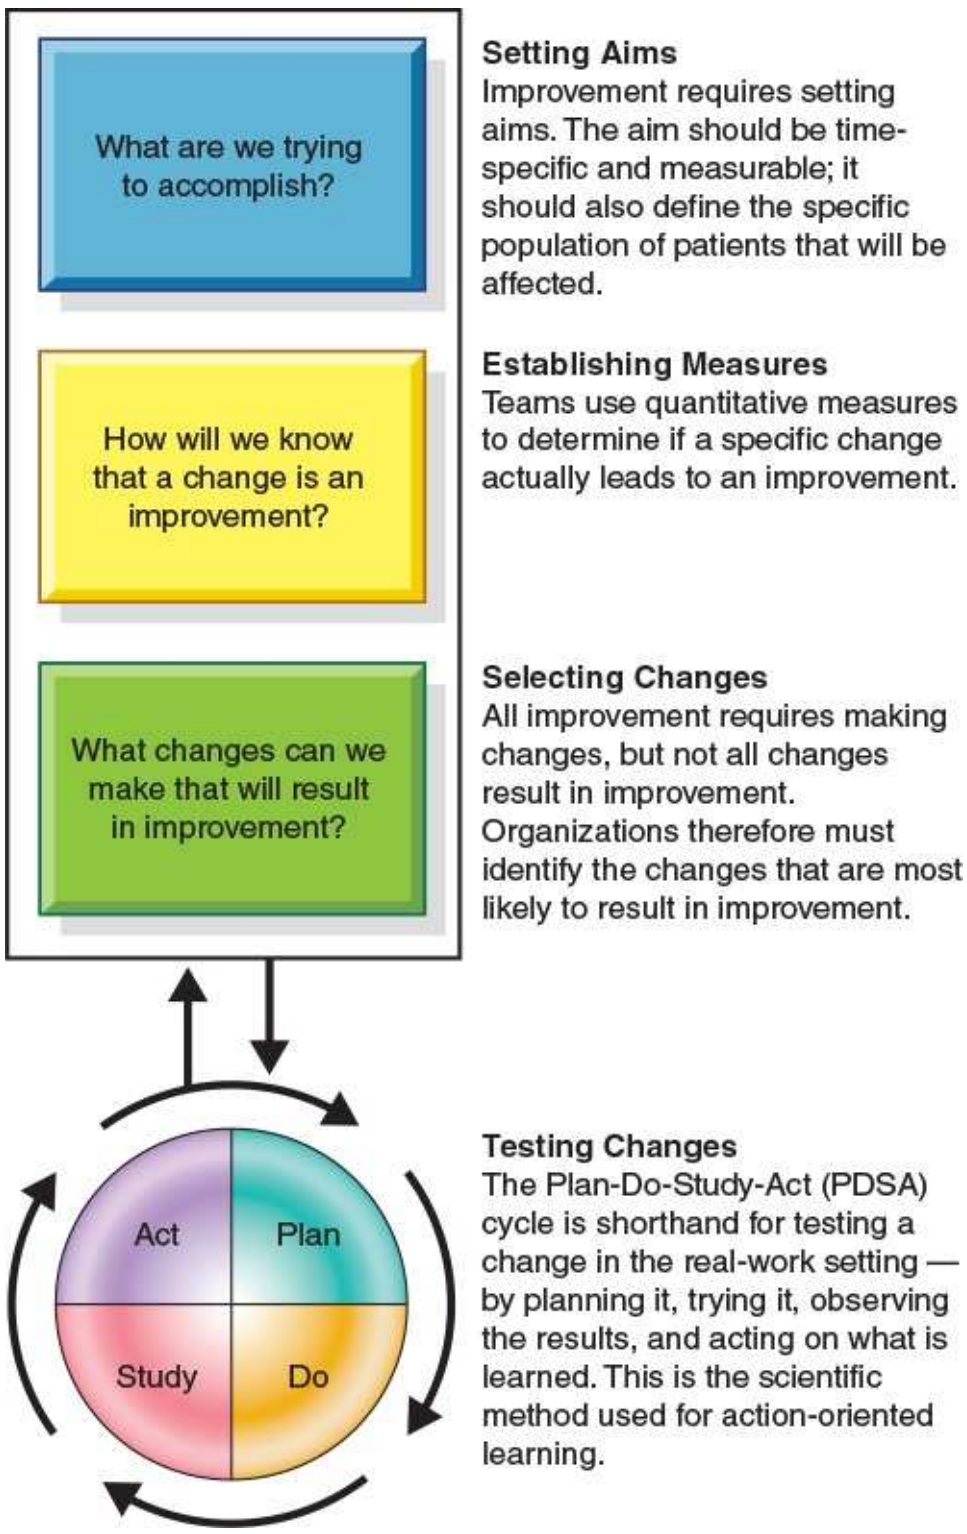

FIGURE 2-6. Model for improvement. Plan-Do-Study-Act (PDSA) cycle to test and implement changes in real-work settings. The PDSA cycle guides the test of change to determine if the change is an improvement. (*Source:* Adapted from Institute for Health Care Improvement. Health system and services research.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

https://www.hrsa.gov/sites/default/files/quality/toolbox/508pdfs/qualityimprovement.pdf)

Nurses who are part of QI teams work collaboratively with their colleagues asking the questions:

- What are the desired improvements?
- How are changes and improvements measured?
- How is staff organized to accomplish the work?
- How can QI models be leveraged to accomplish improvements effectively and efficiently?
- How is change managed?

There are many QI models in use. Figure 2-6 illustrates how the popular Plan-Do-Study-Act (PDSA) model is used to test and implement changes in real-work settings. Read more about QI and performance improvement in everyday clinical practice in Chapter 18 and check out the Institute for Healthcare Improvement website for more resources (http://www.ihi.org/). If you are committed to developing the skills to lead the way to health care quality and safety, you will also want to study Tucker and Melnyk's 12-step guide to implementing EBP, which is illustrated in Figure 2-7.

FIGURE 2-7. Twelve steps to success. Tucker and Melnyk developed this 12-step model for leading and sustaining successful organizational change. (*Source:* Used with permission from Tucker, S., & Melnyk, B. M. [2019]. Leading organizational change and building wellness cultures for maximum ROI and VOI. In B. Melnyk & T. Raderstorf [Eds.], *Evidence-based leadership, innovation and entrepreneurship in nursing and healthcare: A practical guide*. (2019). Springer Publishing. https://www.myamericannurse.com/wp-content/uploads/2019/06/ant6-Evidence-based-practice-515.pdf)

DEVELOPING CLINICAL REASONING AND CLINICAL JUDGMENT

. Describe your own beliefs about the patient, the nurse, health, and what nursing is. Compare and contrast your answers with those of another student. How do they differ and how are they alike? How do you think such differences might influence nursing practice for each of you?
. In preparation for your clinical assignment, you read three research articles about positioning and moving patients who are at risk for pressure injuries (bedsores). The staff nurse responsible for the patient tells you, "Oh, I don't pay any attention to that stuff." How should you respond?
. Describe the research strategy you would use to identify evidence-based interventions to reduce sexual misconduct and assault on your campus; or to promote the use of handwashing, social distancing, and masks to reduce COVID-19 transmission; or to help people stop smoking.
. Go the National Institute of Nursing Research website and click on Research Highlights. Choose one recently funded study and talk with another student about how the research findings might inform your clinical practice.

PRACTICING FOR NCLEX

. A nursing student questions the primary nurse about instilling air into a nasogastric tube to confirm placement, when they learned that x-ray validation of the tube's tip in the stomach reflects best practice. The student is validating safe nursing practice with which type of knowledge?

a. Instinctive knowledge
b. Scientific knowledge
c. Authoritative knowledge
d. Traditional knowledge

. A nurse is using the Johns Hopkins Nursing Evidence-Based Practice (JHNEBP) model PET as a clinical decision-making tool when delivering care to patients. Which steps reflect the intended use of this tool? Select all that apply.

a. Recruiting an interprofessional team to develop and refine an EBP question
b. Drawing from personal experiences of being a patient to establish a therapeutic relationship with a patient
c. Conducting a search of electronic data bases for current treatments for type 2 diabetes
d. Drawing on their spiritual training when counseling a patient in hospice care at end of life
e. Questioning the protocol for assessing postoperative patients returning to the ICU
f. Studying pathophysiology to understand the disease states of assigned patients

. A nurse is using general systems theory to assist a family of four develop healthier food choices. What statement best reflects a key point of this theory?

a. Food choices made by the parents will influence choices made by the children.
b. The children should avoid giving feedback on the family food choices.
c. Boundaries are closed between family members and their environments.
d. A change in one family member's behavior rarely affects other members.

. A charge nurse meets with staff to outline a plan to provide transcultural nursing care for patients in their health care facility. The charge nurse explains that transcultural care as the central theme of nursing care, knowledge, and practice was promoted by which theorist?

a. Madeline Leininger
b. Jean Watson
c. Dorothy E. Johnson
d. Betty Newman

. After their clinical experience, nursing students are given a reflective assignment to discuss the concepts in nursing theory that influence and determine nursing practice. What part of this theory is most important when delivering thoughtful care?

a. Environment
b. Health
c. Nursing
d. Person

. Nursing students have been assigned to discuss a section of a research article examining 24-hour visitation for patients in the intensive care unit (ICU). What topic will the student assigned to the applicability section plan to discuss?

a. Description of the tool that was used to gather the data
b. How the results could be used in the student's practice
c. Statistical methods used to determine the results
d. Whether informed consent was obtained from the participants

. A nurse conducting quantitative research hypothesizes that adolescents with anorexia nervosa who participate in outpatient therapy report less depression than those receiving inpatient treatment. What information does the nurse collect to support the hypothesis?

a. Subjects' demographics
b. Variables
c. Data
d. Instruments

. A nurse is conducting quantitative research to examine which of two types of silicone foam sacral dressings best prevent pressure injuries in bedridden patients. What type of research is the nurse conducting?

a. Descriptive
b. Correlational
c. Quasi-experimental
d. Experimental

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

. A nurse is conducting qualitative research to study the culture of Native Alaskans and how their diet affects their overall state of health. Which method of research is the nurse using?

a. Historical
b. Ethnography
c. Grounded theory
d. Phenomenology

. A nurse is formulating a clinical question using the PICOT format. The nurse begins with determining the "P," which focuses on which element?

a. Comparison to another similar protocol
b. Clearly defined, focused literature review of procedures
c. Specific identification of the purpose of the study
d. Explicit descriptions of the population of interest

. A group of nurses in the postanesthesia care unit propose a study to determine which of two antiemetic medications from the same classification best relieve postoperative nausea. Before implementing the study, whose approval will the nurses need?

a. Organization's surgical director
b. Pharmacy director and staff
c. Institutional review board
d. Director of nursing

ANSWERS WITH RATIONALES

. **b.** Scientific knowledge is obtained through the scientific method or research; this leads to evidence-based practice. Instinct, such as. "I feel this is correct," is not a source of knowledge. Traditional knowledge is the part of nursing practice passed down from generation to generation, often without research data to support it. Examples include daily bathing and changing bed linens each day. Authoritative knowledge comes from an expert and is accepted as truth based on the person's perceived expertise.

. **a, c, e**. The JHNEBP model is a powerful problem-solving approach to clinical decision making, which uses a three-step process called PET: practice question, evidence, and translation. The goal of the model is to ensure that the latest research findings and best practices are quickly incorporated into patient care. Steps in PET include, but are not limited to, recruiting an interprofessional team, developing and refining the EBP question, and conducting internal and external searches for evidence.

. **a.** General systems theory defines a system as a set of interacting elements contributing to the overall goal of the system. A change in one element could affect other subsystems, as well as the whole. To survive, open systems maintain balance through feedback, in this case, family members. An open system allows energy, matter, and information to move freely between systems and boundaries, such as with members of the health care team, whereas a closed system does not allow input from or output.

. **a.** Madeline Leininger's theory provides the foundations of transcultural nursing care by making caring the central theme of nursing. Jean Watson stated that nursing is concerned with promoting and restoring health, preventing illness, and caring for the sick. The central theme of Dorothy E. Johnson's theory is that problems arise because of disturbances in the system or subsystem or functioning below optimal level. Betty Newman proposed that humans are in constant relationship with stressors in the environment and the major nursing focus is keeping the patient system stable through accurate assessment of these stressors.

. **d.** Of the four concepts, the most important is the person. The focus of nursing, regardless of definition or theory, is the person.

. **b.** Applicability refers to how study results could be used in practice. Method includes the design and data analysis. Informed consent affirms the patient's right to agree to participate in a study without coercion, to refuse to participate without jeopardizing their care, the right to confidentiality, the right to be protected from harm, and the ability to withdraw from the study at any time.

. **c.** Data refer to information that the researcher collects from subjects in the study, generally expressed in words, numbers, graphs, and charts. A variable is something (such as conditions, equipment, interventions) that varies and has different values (outcomes) that can be measured. Instruments are devices used to collect and record the data, such as rating scales, pencil-and-paper tests, and biologic measurements.

. **c.** Quasi-experimental research is often conducted in clinical settings to examine the effects of nursing interventions on patient outcomes. Descriptive research is often used to generate new knowledge about topics with little or no prior research. Correlational research examines the type and degree of relationships between two or more variables. Experimental research examines cause-and-effect relationships between variables under highly controlled conditions.

. **b.** Ethnographic research was developed by the discipline of anthropology and is used to examine issues of culture of

interest to nurses. Historical research examines events of the past to increase understanding of the nursing profession today. The basis of grounded theory methodology is the discovery of how people describe their own reality and how their beliefs are related to their actions in a social scene. The purpose of phenomenology (both a philosophy and a research method) is to describe experiences as they are lived by the subjects being studied.

. **d.** The *P* in the PICOT format represents an explicit description of the patient population of interest. *I* represents the intervention, *C* represents the comparison, *O* stands for the outcome, and *T* stands for the time.

. **c**. Federal regulations require that institutions receiving federal funding or conducting studies of drugs or medical devices regulated by the Food and Drug Administration establish institutional review boards (IRBs). The IRBs reviews studies conducted in the institution to determine the risk status of the studies and to ensure that ethical principles are followed. While organizations may have internal procedures for conducting research, such as including surgeons, the director of nursing, the pharmacy director, and staff, these are not government mandates. The type of study, such as randomized-controlled study, will be determined by the nurse in collaboration with the prescriber and approval of the IRB.

Health, Wellness, and Health Disparities

Ruth Jacobi

Ruth is a 62-year-old woman who was hospitalized after a “mini-stroke.” She has now returned to her pre-event level of functioning and is being prepared for discharge. She states, “I know that I have an increased risk for a major stroke, so I want to do everything possible to stay as active and as healthy as I possibly can.”

Sara Thurston

Sara, a college freshman, is encouraged to visit the student health center by her roommate because she rarely visits the dining hall for meals, runs 5 to 8 miles a day, and has recently lost a significant amount of weight. She is very thin now, and when she does eat a meal, she just seems to move the food around on her plate. Sara states, “I’m plenty healthy, just a bit ‘nuts’ about being fit!”

Daniel Sternman

Daniel, a 27-year-old man with a history of schizophrenia, comes to the mental health clinic, loudly demanding relief from the voices that are telling him to hurt himself. Mr. Sternman is well known by the clinic staff. His medical record reveals that he has had numerous visits to the clinic and that he has difficulty interacting and dealing with various staff members.

Learning Outcomes

After completing the chapter, you will be able to accomplish the following:

. Describe concepts and models of health, wellness, disease, and illness.
. Compare and contrast acute illness and chronic illness.
. Discuss the factors that play a role in health equity and health disparities including social determinants of health.
. Explain how the human dimensions, basic human needs, and self-concept influence health and illness.
. Summarize the role of the nurse in promoting health, preventing illness, and addressing disparities in health care.
. Explain the levels of preventive care.
. Define diversity, inclusion, and equity and explain what it means to be antiracist.

Nursing Concepts

Health care disparities
Health, wellness, and illness
Diversity, equity, and inclusion

Key Terms

acute illness
antiracism
chronic illness
disease
diversity
equity
exacerbation
health
health disparity
health equity
health promotion
holistic healthcare
illness
inclusion
institutional or structural racism
morbidity
mortality
racism
remission
risk factor
social determinants of health
unconscious or implicit bias
vulnerable populations
wellness

The primary objectives of the nurse as caregiver are to promote health; to prevent illness; to restore health; and to

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

facilitate coping with illness, disability, or death. These objectives focus care on maximizing the health of people of all ages and in all populations, in all settings, and in both health and illness.

Health is more than just the absence of illness; it is an active process in which a person moves toward their maximum potential. Each person has a different definition of health. (See the accompanying Reflective Practice box for an example.) To give thoughtful, person-centered **holistic health care**—care that addresses the many dimensions that comprise the whole person—the nurse must understand and respect each person's own definition of health and responses to illness and should be familiar with models of health and illness. The nurse's knowledge of health and illness is even more important because of today's focus on health promotion and advocacy, the continuing trend toward care being provided in the home and community, the increasing numbers of older adults, the growing incidence of chronic illnesses and mental health problems, and the ongoing efforts to maximize health care outcomes for all populations (diversity, equity, inclusion).

The 2013 report by the Institute of Medicine (renamed the National Academy of Sciences, Engineering, and Medicine in 2015) and the National Research Council (*U.S. Health in International Perspective: Shorter Lives, Poorer Health*) provides additional impetus to foster positive health behaviors. Compared to 16 other affluent countries, the United States has a serious health disadvantage, despite the fact that the country spends twice as much per person on health care in comparison to the other nations in the survey. Americans fare worse in nine key health areas: infant mortality and low birth weight, injuries and homicides, teenage pregnancies and sexually transmitted infections, prevalence of HIV and AIDS, drug-related deaths, obesity and diabetes, heart disease, chronic lung disease, and disability. There is agreement that the United States must vigorously investigate potential explanations for this health disadvantage as well as intensify efforts to strengthen systems responsible for health and social services, education, and employment; promote healthy lifestyles; and design healthier environments. Some of these problems are long-standing concerns, and many evidence-based strategies have been implemented to address these challenges. The United States can no longer afford to ignore these compelling issues. Better health must be an achievable outcome for all Americans (Woolf & Aron, 2013). As this text goes to publication, Congress is again trying to decide how best to meet the health care needs of U.S. citizens. See Chapter 11, The Health Care Delivery System.

CONCEPTS OF HEALTH AND WELLNESS

A classic definition of health is that **health** is a state of complete physical, mental, and social well-being, not merely the absence of disease or infirmity (World Health Organization, 1974). The health of the public is measured globally by **morbidity** (how frequently a disease occurs) and **mortality** (the number of deaths resulting from a disease). On a personal level, however, most people define health according to how they feel ("I feel really sick"), the absence or presence of symptoms of illness ("I have a terrible pain in my stomach"), or their ability to carry out activities of daily living ("I felt so much better that I got up and cooked supper"). The accompanying feature, Through the Eyes of a Student (on page 56), presents a personal viewpoint of the meaning of health. How would you describe health?

Each person defines health in terms of their own values and beliefs. The person's family, culture, community, and society also influence this personal perception of health.

Think back to **Sara Thurston**, the college freshman who rarely eats and runs several miles almost daily. According to her statement, she considers herself to be healthy. However, her roommate is concerned because of what she views as excessive exercise and Sara's poor nutrition. The nurse needs to investigate Sara's views further to determine exactly what Sara believes to be healthy. Doing so provides a foundation on which to develop an appropriate care plan.

QSEN Reflective Practice: Cultivating QSEN Competencies

CHALLENGE TO ETHICAL AND LEGAL SKILLS

My first college roommate, Sara Thurston, seemed the ideal roommate when I first met her. A good student, she was thoughtful, outgoing, and fun. By October, however, I was really worried about her. I noticed that she rarely wanted to come to the dining hall with our group of friends. When she did come,

she just seemed to pick at her food. She also spent a lot of time at the athletic center, running 5 to 8 miles almost daily. I wasn't surprised when she started losing significant amounts of weight. What worried me was her lack of willingness to talk about her nutritional habits and health. She told me that she was plenty healthy, just a bit "nuts" about being fit! She also kidded that I'd be healthier if I worked out more often with her. While she was certainly right about that, I was worried that she had a serious eating disorder and wasn't sure what I could do to help. She politely told me to "mind my own business" when I asked her if she had ever spoken with anyone about her health and eating.

Thinking Outside the Box: Possible Courses of Action

- Respect Sara's wishes and simply try to be a good friend without continuing to confront her about her nutritional status.
- Tell Sara I am concerned that she has a serious eating disorder, and then plan the next steps with her, fully respecting her right to seek or refuse professional help.
- Tell Sara that if she fails to get professional help, I will contact her parents or a counselor at school.

Evaluating a Good Outcome: How Do I Define Success?

- Sara gets whatever help she needs to address her eating problems and regain health.
- Sara's right to make her own decisions is respected.
- My obligations as a friend are fulfilled.
- My beginning ability to identify and correctly respond to health problems affirms my choice for nursing.

Personal Learning: Here's to the Future!

Unfortunately, I did not intervene because (1) I failed to recognize how serious a problem this would become, and (2) I wasn't sure what I could do after Sara refused my initial offers of help. Sara dropped out of school at the end of our freshman year and she has not returned my calls, so I'm not sure how she is doing. I've read more about eating disorders, and I now know how important it is to get professional help early. I learned too late that Sara had been in treatment for anorexia during high school and that the pressures of college life had led to a relapse. I think I valued her friendship more than I valued getting her the help that she needed to address a serious health problem.

QSEN SELF-REFLECTION ON QUALITY AND SAFETY COMPETENCIES DEVELOPING KNOWLEDGE, SKILLS, AND ATTITUDES FOR CONTINUOUS IMPROVEMENT

How do you think you would respond in a similar situation? Why? What does this tell you about yourself and about the adequacy of your skills for professional practice? Can you think of other ways to respond? Do you agree with the criteria that the nursing student used to evaluate a successful outcome? Why or why not? What *knowledge, skills,* and *attitudes* do you need to develop to continuously improve quality and safety when caring for patients like Sara?

Patient-Centered Care: What is the best approach when Sara denies that she has an eating problem? If Sara refuses any help, is it better to focus on her positive attributes and avoid conflict regarding her current situation? How might the student's and Sara's developmental level have affected their responses? How should you, as her roommate and friend, proceed? What is the best way to communicate emotional support, concern, and caring to Sara?

Teamwork and Collaboration/Quality Improvement: What communication skills do you need in order to facilitate your role as a patient advocate for Sara? As a student nurse, what other skills do you need to respond appropriately in this situation? Should you offer to make an appointment for her with a professional (nutritionist, counselor, nurse) or offer to accompany her to an appointment?

Safety/Evidence-Based Practice: Can you secure any evidence in nursing literature that provides information related to eating disorders and the need for professional treatment? Should you share this information with Sara? What response best contributes to a safe environment for Sara?

Informatics: If you were completing a rotation in a clinical setting as a student nurse, what information should you document electronically regarding your assessment of a patient like Sara and her response to any interventions?

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Through the Eyes of a Student

Carrie was a 17-year-old who attended my high school, dated my best friend Ricky, and participated in many of the same clubs and activities as I did. By looking at her, I never would have guessed anything was wrong. However, once I got to know her, I learned that she was diagnosed with cancer and that the disease had spread through her heart and lungs. The situation, as doctors continually told her, did not look promising. Yet, she never once let that slow her down, and she lived each day to the fullest. It was almost 1 year ago that I watched as this friend passed away from bone cancer. However, until the days before her last breath, in my eyes, she was a happy and healthy girl. She never once let the disease get the best of her, and she fought for life every second of every day. Her constant optimism and determined smile touched and moved so many others. So you ask me, was Carrie healthy?

Health to me is a state of mind, not the physical condition of a person's body. Carrie, in my opinion, was the definition of healthy: She was happy, she lived her life to the fullest, and she continually inspired others to embrace life. The dictionary may state that health is the absence of a disease; however, for me, it is the way a person thinks and reacts to life. A person's health consists of being able to work to the best of her capability, look out for herself, and her ability to respond to life enthusiastically. In my eyes, a person like Carrie can be physically unwell, but in terms of living, is healthy. Perhaps this is where health and wellness differ, in that, to me, health means the person's entire state of being and is decided by the person, whereas wellness refers more to the physical condition of a person and is determined more readily by society. The words *illness* and *disease* also correspond with these words. I believe that illness, such as health, is a matter of thinking, while disease is a medical term that relates to physical condition and wellness. All of these states are constantly changing, and I have probably experienced the best and worst of all of them. However, as I embark on this new and exciting journey of college, I consider myself extremely healthy. I am living each day to the fullest, trying to impact other people's lives, and am filled with optimism. This all may change shortly, but as I look back on Carrie's life and the effect she has had on me, I will always try to live my life in a healthy and grateful way.

—Molly Proskine, Georgetown University

Health integrates all the human dimensions—the physical, intellectual, emotional, sociocultural, spiritual, and environmental aspects of the whole person. The nurse giving holistic care must equally consider all these interrelated dimensions of the whole person (Fig. 3-1).

FIGURE 3-1. The human dimensions. All of these interdependent parts compose the whole person.

Unfolding Patient Stories: Kim Johnson • Part 1

Kim Johnson—a 26-year-old police officer—is hospitalized with a thoracic spinal cord injury from a gunshot wound and is now paraplegic. What factors influencing health status and recovery should the nurse consider for each human dimension when developing an individualized, holistic care plan for Kim? (Kim Johnson's story continues in Chapter 11.)

Care for Kim and other patients in a realistic virtual environment: *vSim for Nursing* (thepoint.lww.com/vSimFunds). Practice documenting these patients' care in DocuCare (thepoint.lww.com/DocuCareEHR).

Wellness—a term often used interchangeably with health—is an active state of being healthy, including living a lifestyle that promotes good physical, mental, and emotional health. Dunn (1977) described his model of high-level wellness as functioning to one's maximum potential while maintaining balance and a purposeful direction in the environment. Dunn differentiated "wellness" from "good health," believing that good health is a passive state simply denoting that the person is not ill at this time. Wellness is a more active state, regardless of one's level of health. Dunn also defined processes that help people know who and what they are. These processes, which are a part of each person's perception of their own wellness state, are *being* (recognizing oneself as separate and individual), *belonging* (being part of a whole), *becoming* (growing and developing), and *befitting* (making personal choices that befit oneself for the future). Dunn's model encourages the nurse to care for the total person, with regard for all factors affecting the person's state of being while striving to reach maximum potential.

CONCEPTS OF ILLNESS AND DISEASE

Disease is a medical term, referring to pathologic changes in the structure or function of the body or mind. Box 3-1 lists common causes of disease. An **illness** is the response of the person to a disease; it is a process in which the person's level of functioning is changed when compared with a previous level. This response is unique for each person and is influenced by self-perceptions, others' perceptions, the effects of changes in body structure and function, the effects of those changes on roles and relationships, and cultural and spiritual values and beliefs. A disease is traditionally diagnosed and treatment is prescribed by a health care provider or advanced practice nurse, whereas nurses focus on the person with an illness. However, the terms *disease* and *illness* are often used interchangeably. It is important for nurses to remember that patients may have an illness or injury but still achieve maximum functioning and quality of life, and consider themselves to be healthy.

Classifications of Illness

Illnesses are classified as either acute or chronic. A person may have an acute illness, a chronic illness, or both at the same time; for example, an adult with diabetes (a chronic illness) may also have an acute episode of severely low blood sugar.

Acute Illness

An **acute illness** usually has a rapid onset of symptoms and lasts only a relatively short time. Although some acute illnesses are life threatening, simple acute illnesses, such as the common cold or diarrhea, do not usually require medical treatment. If medical care is required, a specific treatment with medication (e.g., an antibiotic for pneumonia), surgical procedures (e.g., an appendectomy for appendicitis), or another medical treatment usually return the person to normal functioning.

Box 3-1 Common Causes of Diseases

- Inherited genetic defects
- Developmental defects resulting from exposure to such factors as viruses or chemicals during pregnancy
- Biologic agents or toxins
- Physical agents such as temperature, chemicals, and radiation
- Generalized tissue responses to injury or irritation
- Physiologic and emotional reactions to stress
- Excessive or insufficient production of body secretions (hormones, enzymes, and so forth)

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Chronic Illness

Chronic illness is a broad term that encompasses a number of different physical and mental alterations in health, each having one or more of the following characteristics:

- It is a permanent change.
- It causes, or is caused by, irreversible alterations in normal anatomy and physiology.
- It requires special patient education for rehabilitation.
- It requires a long period of care or support.

Chronic illnesses usually have a slow onset and many have periods of **remission** (the disease is present, but the person does not experience symptoms) and **exacerbation** (the symptoms of the disease reappear).

Recall **Daniel Sternman**, the young man with schizophrenia. The nurse would integrate knowledge of this disorder, understanding that it is a chronic illness that can be treated. The patient's arrival at the clinic with reports of hearing voices would indicate to the nurse that symptoms of the disorder have reappeared, necessitating treatment.

The Centers for Disease Control and Prevention (CDC) reports that chronic diseases and conditions—such as heart disease, stroke, cancer, type 2 diabetes, obesity, and arthritis—are among the most common, costly, disabling and preventable of all health problems (CDC, 2016a, 2016b). A 2014 CDC study found that, each year, nearly 900,000 Americans die prematurely from the 5 leading causes of death (heart disease, cancer, chronic lower respiratory disease, stroke, and unintentional injury), yet 20% to 40% of the deaths from each cause could have been prevented.

The chronic disease burden in the United States largely results from a short list of risk factors that can be effectively addressed for individuals and populations. These risk factors include tobacco use, poor diet and physical inactivity (both strongly associated with obesity), excessive alcohol consumption, uncontrolled high blood pressure, and hyperlipidemia (CDC, 2019).

To help to meet the chronic disease burden, the CDC uses four cross-cutting strategies: (1) epidemiology and surveillance to monitor trends and inform programs, (2) environmental approaches that promote health and support healthy behaviors, (3) health system interventions to improve the effective use of clinical and other preventive services, and (4) community resources linked to clinical services that sustain improved management of chronic conditions. This approach is based on the assumption that establishment of community conditions to support healthy behaviors and promote effective management of chronic conditions will deliver healthier students to schools, healthier workers to employers and businesses, and a healthier population to the health care system (Bauer et al., 2014, p. 45).

Because chronic illnesses are the leading health problem in the world, the health promotion and illness prevention activities discussed later in this chapter are vital to nursing care. Nurses will be caring for more patients with chronic illnesses in the future. Although not all people with a chronic illness require care, all who are chronically ill must accept certain conditions to be able to live with the illness on a day-to-day basis for the rest of their lives. People with a chronic illness often grieve over losses or changes in physical structure and function; worry about their finances, status, roles, and dignity; and face the possibility of an earlier death.

To successfully adapt to a chronic illness, the person must learn to live as normally as possible and maintain a positive self-concept and sense of hope, despite symptoms and treatments that may make the person feel different from others. Activities of daily living, relationships, and self-care activities must often be modified, and it is important that the person maintain a feeling of being in control of their own life and the prescribed treatments.

Nurses care for people of all ages with chronic illnesses, providing that care in all types of settings, including homes, hospitals, clinics, long-term care facilities, and other institutions. Regardless of the age of the patient or the effects and demands of the illness or the setting, the nurse must make every effort to promote health for patients with chronic illness, with a focus on care that emphasizes what is possible rather than what can no longer be.

Diseases and Deaths of Isolation and Despair

In this decade, both clinicians and researchers are studying two seemingly associated demographic trends: income stagnation and rising premature mortality from suicides, drug poisoning, and alcoholic liver disease among U.S. non-

Hispanic Whites with low education. Some are now suggesting that these population-level trends indicate that despair induced by financial stressors is a shared pathway to these causes of disease and death. See Figure 3-2 for a schema illustrating this progression from economic stagnation to deaths of despair (Shanahan et al., 2019). What these trends, exacerbated during the pandemic, make clear, is the complexity of factors influencing the health of individuals and communities. You will want to be very alert to all the variables that influence health and well-being. Until recently, we paid scant attention to socioeconomic circumstances.

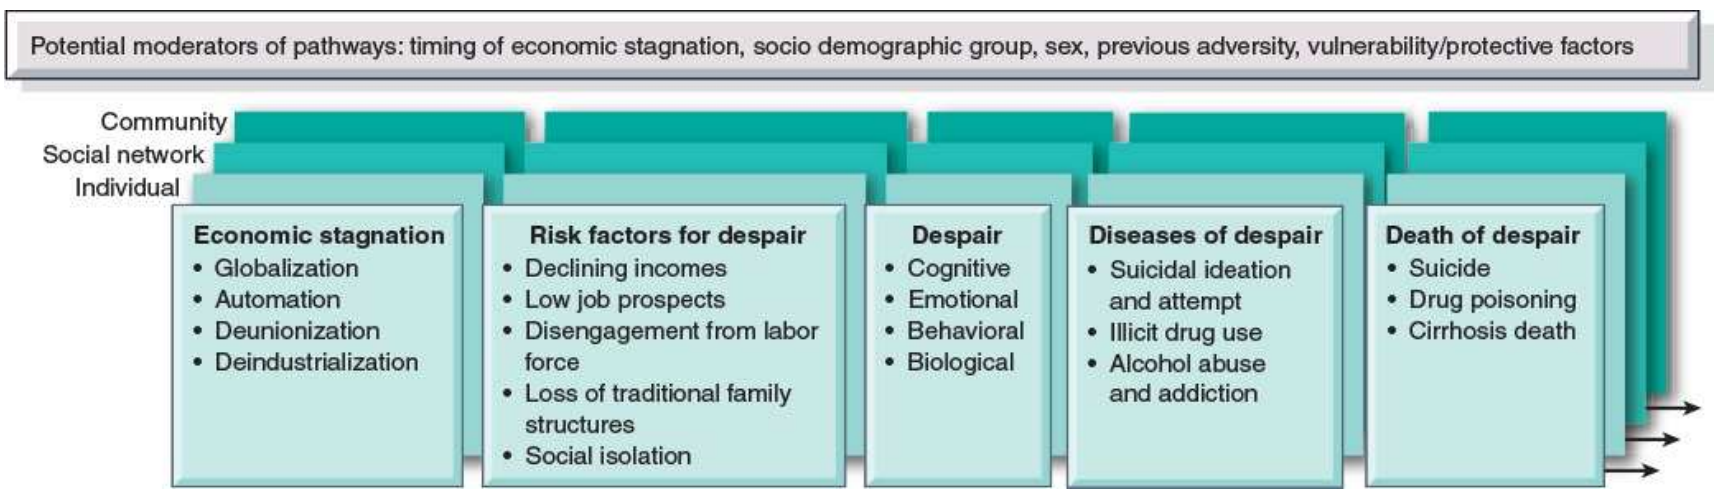

FIGURE 3-2. Potential moderators of pathways: timing of economic stagnation, sociodemographic group, sex, previous adversity, vulnerability/protective factors. (*Source:* Used with permission from Shanahan, L., Hill, S. N., Gaydosh, L. M., Steinhoff, A., Costello, E. J., Dodge, K. A., Harris, K. M., & Copeland, W. E. [2019]. Does despair really kill: A roadmap for an evidence-based answer. *American Journal of Public Health, 109*[6], 854–858.)

Illness Behaviors

When a person becomes ill, certain illness behaviors may occur in identifiable stages (Suchman, 1965). These behaviors are how people cope with altered functioning caused by the disease. They are unique to the person and are influenced by age, sex assigned at birth, family values, economic status, culture, educational level, and mental status.

There is no specific timetable for the stages-of-illness behaviors, which may occur rapidly or slowly. Nursing roles throughout the stages remain constant. In all stages, the nurse accepts the patient as an individual, gives nursing care based on prioritized needs, and facilitates recovery through physical care, emotional support, and health education.

Stage 1: Experiencing Symptoms

How do people define themselves as "sick"? The first indication of an illness usually is recognizing one or more symptoms that are incompatible with their personal definition of health. Although pain is the most common symptom indicating illness, other common symptoms include rash, fever, bleeding, or cough. If the symptoms last for a short time or are relieved by self-care, the person usually takes no further action. If the symptoms continue, however, the person enters the next stage.

Stage 2: Assuming the Sick Role

The person now self-defines as being sick, seeks validation of this experience from others, gives up normal activities, and assumes a "sick role." At this stage, most people focus on their symptoms and bodily functions. Depending on individual health beliefs and practices, the person may choose to do nothing, may research symptoms on Internet sources, may buy over-the-counter medications, may try alternative remedies to relieve symptoms, or may seek out a health care provider for diagnosis and treatment. In our society, an illness becomes "legitimate" when a health care provider diagnoses it and prescribes treatment. After seeking help from the health care provider, the person becomes a patient and enters the next stage.

Recall **Daniel Sternman**, the young man with schizophrenia. His arrival at the mental health clinic indicates that he is seeking help from a health care provider. The nurse would interpret this behavior as signaling his assumption of the sick role.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Stage 3: Assuming a Dependent Role

This stage is characterized by the patient's decision to accept the diagnosis and follow the prescribed treatment plan. The person may initially have difficulty conforming to the recommendations of the health care provider and may decide to seek a second opinion or deny the diagnosis. The lack of independence is more troubling for some people who, based on their diagnosis, often require assistance in carrying out activities of daily living and need emotional support through acceptance, approval, physical closeness, and protection.

If the disease is serious (such as a heart attack or stroke), the patient may enter the hospital for treatment. If the symptoms can be managed by the patient or family alone or with the assistance of home care providers, the patient is cared for at home. To facilitate adherence to the treatment plan, the patient needs effective relationships with caregivers, knowledge about the illness, and an individualized care plan. The patient's responses to care depend on a variety of factors, including the seriousness of the illness, the patient's degree of fear about the disease, the loss of roles, the support of others, and previous experiences with illness care. The optimal outcome expected by both caregivers and family is to get well and resume normal roles.

Stage 4: Achieving Recovery and Rehabilitation

Recovery and rehabilitation might begin in the hospital and conclude at home, or may be totally concluded at a rehabilitation center or at home. Most patients complete this final stage of illness behavior at home. In this stage, the person gives up the dependent role and resumes normal activities and responsibilities. If the care plan includes health education, the person may return to health at a higher level of functioning and health than before the illness.

Remember **Ruth Jacobi**, the woman being prepared for discharge after a mini-stroke. The patient's stated desire to be as active and as healthy as she possibly can reflects her desire to give up the dependent role. The nurse would use this knowledge as a basis for the patient's teaching plan, thereby fostering a return to health, possibly at a level higher than before the patient's mini-stroke.

Effects of Illness on the Family

Most nursing care is given to patients with some form of support system, usually family members. When an illness occurs, daily life changes for both the patient and the family. For example, a chronic illness creates stress for the patient and family because of possible lifelong alterations in roles or lifestyle, frequent hospitalizations, economic problems, and decreased social interactions among family members. The responses of family members to an illness are also individualized. Some family members want to be with the patient all the time, while others might avoid visiting. Parents of a sick child often react with blame, overprotection, and severe anxiety, and family members of patients requiring intensive care often feel alone and frightened. In both cases, they might also feel guilty and imagine the worst possible outcome. See Chapter 4 for more information.

Care for Family Caregivers

Carpenter and Gould (2020) note that in the United States alone an, estimated 65.7 million unpaid family caregivers provide care to someone who is ill, has a disability, or is an older adult. "Even with strong support systems the caregiver may experience depression, social isolation, weight loss, irregular sleep patterns, lack of interest in activities that once brought joy, increased alcohol or drug use, or stress manifesting itself in physical ailments" (p. 53). Nurses working with family caregivers are wise to urge them to take responsibility for their own health and well-being. Suggestions include:

- Engage in self-compassion—be kind to yourself
- Practice gratitude
- Do something for yourself daily
- Ask for help
- Find a support group
- Seek professional help for yourself if needed
- Check out available resources
- Be realistic about expectations—know that you and your loved one may need to explore other options

How might you use this list to counsel a parent caring for a child with cerebral palsy or a spouse with early-onset dementia?

DISPARITIES IN HEALTH CARE

Healthy People 2030 defines **health equity** as the attainment of the highest level of health for all people. Although health care is increasingly focused on the promotion of health and the prevention of illness, there continue to be disparities that lead to different health outcomes among different populations of people. A **health disparity** is defined by Healthy People 2030 as a "particular type of health difference that is closely linked with social, economic, and/or environmental disadvantage" (Healthy People 2030, n.d.a).

Health disparities are influenced by many different factors, including race and ethnicity, poverty, sex assigned at birth, age, mental health, educational level, disabilities, sexual orientation, health insurance, and access to health care. Healthy People 2030 defines **social determinants of health** as the conditions in the environments in which people are born, live, learn, work, play, worship, and age that affect a wide range of health, functioning, and quality-of-life outcomes and risks (Healthy People 2030), as shown in Figure 3-3. Kristof (2020) writes that "A newborn in a ZIP code of North Philadelphia with a largely poor and Black population has a life expectancy 20 years shorter than a newborn in mostly White central Philadelphia just four miles away; that's not because one infant has displayed 'weak character'." A Kaiser Family Foundation study found that only 19% of Black adults 65 years or older have documented their wishes at the end of life compared with 65% of White adults in the same age group. In addition, a perception exists in the health care community that the Black population avoids end-of-life discussions and underuses palliative and hospice services (ANA Center for Ethics and Human Rights, 2020). See also the discussion of social determinants of health in Chapter 4 and Healthy People 2020's list of social determinants across the life stages in Box 3-2.

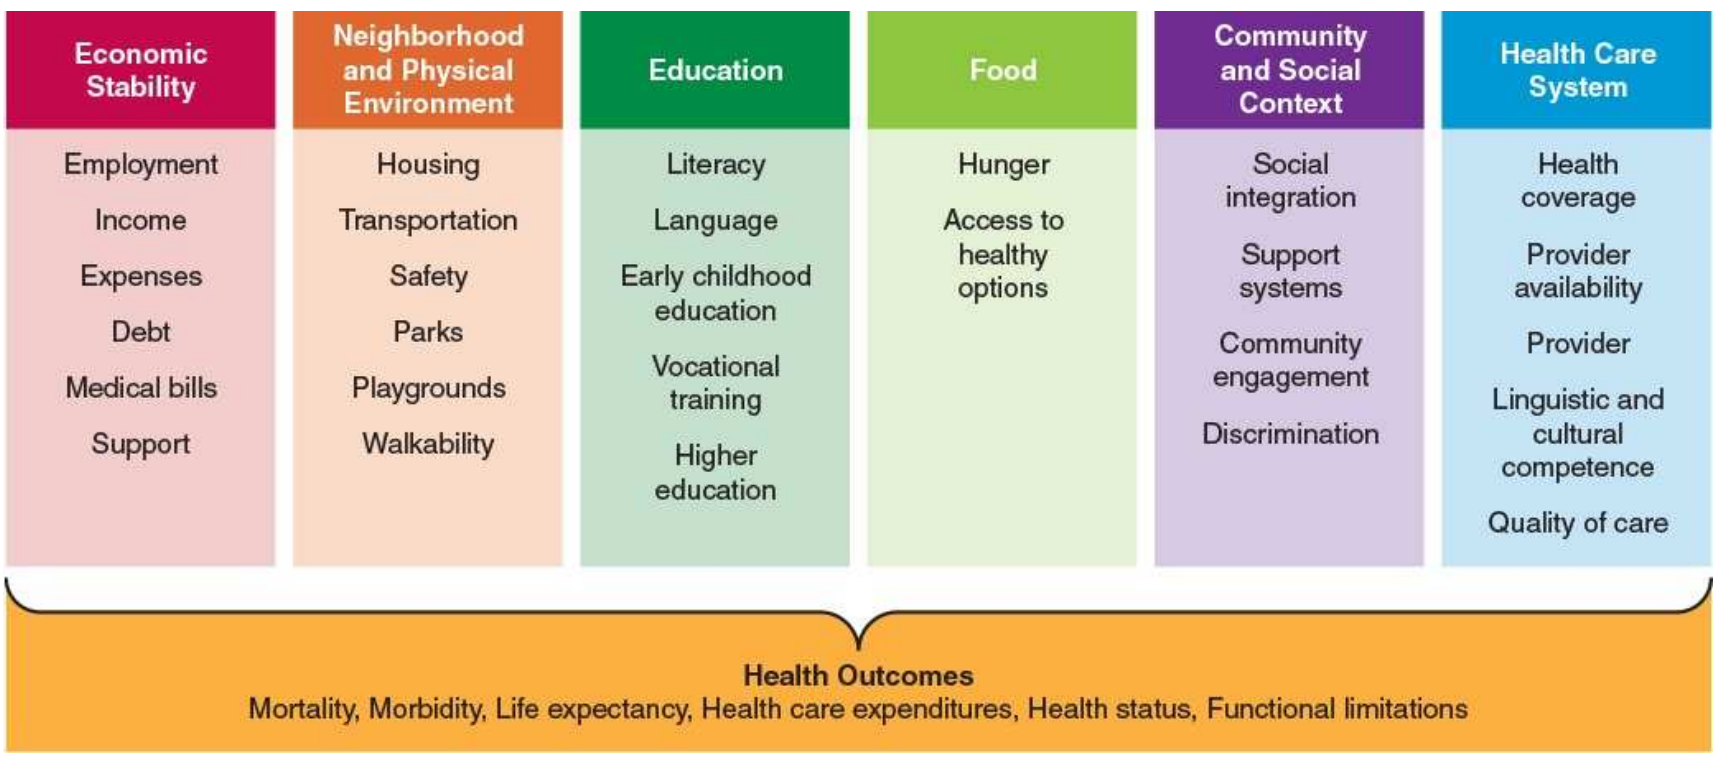

FIGURE 3-3. Social determinants of health. (*Source:* Used with permission: The Henry J. Kaiser Family Foundation.)

Box 3-2 **Social Determinants Across the Life Stages**

From infancy through old age, the conditions in the social and physical environments in which people are born, live, work, and age can have a significant influence on health outcomes.

Children

- Early and middle childhood provide the physical, cognitive, and social-emotional foundation for lifelong health, learning, and well-being. A history of exposure to adverse experiences in childhood, including exposure to violence and maltreatment, is associated with health-risk behaviors such as smoking, alcohol and drug use, and risky sexual behavior, as well as health problems such as obesity, diabetes, heart disease, sexually transmitted diseases, and attempted suicide.
- Features of the built environment, such as exposure to lead-based paint hazards and pests, negatively affect the health and development of young children.

Adolescents

- Because they are in developmental transition, adolescents and young adults are particularly sensitive to environmental influences. Environmental factors, including family, peer group, school, neighborhood, policies, and societal cues, can either support or challenge young people's health and well-being. Addressing young people's positive development facilitates their adoption of healthy behaviors and

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

helps to ensure a healthy and productive future adult population.
- Adolescents who grow up in neighborhoods characterized by poverty are more likely to be victims of violence; use tobacco, alcohol, and other substances; become obese; and engage in risky sexual behavior.

Adults

- Access to and availability of healthier foods can help adults follow healthful diets. For example, better access to retail venues that sell healthier options may have a positive impact on a person's diet. These venues may be less available in low-income or rural neighborhoods.
- Longer hours, compressed work weeks, shift work, reduced job security, and part-time and temporary work are realities of the modern workplace and are increasingly affecting the health and lives of U.S. adults. Research has shown that workers experiencing these stressors are at higher risk of injuries, heart disease, and digestive disorders.

Older Adults

- Availability of community-based resources and transportation options for older adults can positively affect health status. Studies have shown that increased levels of social support are associated with a lower risk for physical disease, mental illness, and death.

Source: HealthyPeople.gov. Social determinants across the life stages. https://www.healthypeople.gov/2020/leading-health-indicators/2020-lhi-topics/Social-Determinants/determinants.

Disparities in health outcomes are especially common in racial and ethnic minorities, in whom higher rates of obesity, cancer, diabetes mellitus, and AIDS are seen. See the U.S. Department of Health and Human Services Office of Minority Health for Specifics (USDHHS, 2016). The Health Equity Institute urges the following measures to eliminate avoidable health inequities and health disparities (Health Equity Institute):

- Attention to the root causes of health inequities and health disparities—specifically, health determinants, a principal focus of Healthy People 2020 and 2020–2030.
- Particular attention to groups that have experienced major obstacles to health associated with socioeconomic disadvantages and historical and contemporary injustices.
- Promotion of equal opportunities for all people to be healthy and to seek the highest level of health possible.
- Distribution of socioeconomic resources needed to be healthy in a manner that progressively reduces health disparities and improves health for all.
- Continuous efforts to maintain a desired state of equity after avoidable health inequities and health disparities are eliminated.

Note that health equity is different from equality. In order to ensure that individuals are provided with the resources they need to have access to the same opportunities, different types and degrees of support are needed. If both a 6-ft and a 4-ft person are hoping to see over a 7-ft wall, giving them each a 12-in stool helps one and frustrates the other. What will each of your patients need to optimize their health? One size fits all definitely does not apply here!

Fostering Diversity, Inclusion, and Equity

As nurses are being called to work actively to create health equity, it is important to reflect on why health disparities are so persistent, seemingly in spite of many collective efforts to address them. We know that **institutional or structural racism**, the systematic distribution of resources, power, and opportunity in our society to the benefit of people who are White and to the exclusion of people of color, plays a role, as does **unconscious or implicit bias**, prejudice in favor of or against one thing, person, or group as compared to another, in a way that is usually considered unfair. Unconscious bias occurs automatically, as the brain makes quick judgments based on past experiences and backgrounds. Until everyone in health care is committed to creating a culture of respectful diversity, inclusion, and equity, disparities will persist. The status quo of race-neutral, race-blind, or culturally competent care will only strengthen existing disparities. Know that the ANA *Code of Ethics for Nurses with Interpretive Statements* (Provision 8.3) obligates nurses to advance health and human rights and reduce disparities (ANA, 2015). The ANA also published a Position Statement in 2018 titled "The Nurse's Role in Addressing Discrimination: Protecting and Promoting Inclusive Strategies in Practice Settings, Policy, and Advocacy."

Koschmann et al. (2020) issued an urgent call for **antiracism** in nursing practice, which requires every nurse to engage in a daily practice of actively combating **racism**, including structures, institutions, and practices: "Rather than race-neutral or culturally competent care, antiracist practice actively stands against racism. We must face the epidemic of racism head on by applying rigorous changes to nursing practice, research and education, and, as is always true with our profession, do this with empathy and respect" (p. 540). See Figure 3-4 (on page 62), Becoming Anti-Racist, for practical strategies to help you move into the learning and growth zones.

Monica McLemore (2020) describes five tools and skills nurses can implement incrementally. She uses "SPLIT" to describe these: ***S***imulation, ***P***ublic health, ***L***eading, ***I***mmersion, and ***T***ension. For McLemore, SPLIT is a simple way to

think about what we can do right now about the awareness people are starting to gain of the lived experiences of Black, Indigenous, and other people of color. "We [nurses] need to publicly address the fact that we are on the side of the people we serve … People are looking for us to lead—learners, the unit staff, all the places within our health care institutions where we have some racial and ethnic diversity … As nurses, we need to enlist the tools we have and adapt them to assist us as novices in racial justice and antiracism work. There are no CliffsNotes or shortcuts." (p. 70)

Diversity is about welcoming individuals of all races, religions, nationalities, cultures, ages, sexual orientations, and identities. **Inclusion** is about giving everyone a sense of purpose and belonging, a feeling of being valued. The example is often giving that diversity is about inviting different people to a dance. When we are dancing with one another that is inclusion. If you walk into a cafeteria where Whites sit at one table and Blacks and other people of color at different tables, you may have diversity but not inclusion. Similarly, **equity** is not about treating everyone the same, it is about ensuring that everyone has access to the conditions they need to thrive. What one person needs to manage diabetes may be very different than what another needs. It is never too early to begin assessing the cultures you will experience in different work settings and to question those cultures in which inclusion is the exception and equity an unrealized goal. See the Challenging Topics feature on page 62.

Vulnerable Populations

National trends in efforts to prevent health disparities focus on **vulnerable populations**, such as racial and ethnic minorities, those living in poverty, women, children, older adults, residents of rural areas and low-income areas of cities, and people with disabilities and special health care needs. Be sure to check out the Vulnerable Populations Alert in this and other chapters. Emphasis is given to disparities in access to care, quality of care, health insurance status, specific sources of ongoing care, and quality and access to care for people with limited English proficiency. It is critical that nurses recognize that disparities exist and plan specific and individualized interventions for patients who are most at risk.

THOUGHTFUL, PERSON-CENTERED PRACTICE: CHALLENGING TOPICS

Health Equity and Persistent Health Disparities

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Many controversial issues make it challenging to know how to respond as a professional nurse in select scenarios. Often, the nurse's personal and/or professional values may conflict with options desired by patients, families, colleagues, employers and communities. Too often our practice environments prioritize generating revenues and saving money over excellent patient care. Where institutional racism and unconscious bias create a culture that exacerbates health disparities, nurses often struggle to meet the all too real needs of vulnerable patients.
Read the scenario below and see if you can articulate what you believe, why you believe this, and how these beliefs are likely to inform the decisions you make and your behavior, especially when you are confronted with competing obligations. Based on Tanner's Clinical Judgment Model (2006), consider reflection-in-action and reflection-on-action (Nielson et al., 2007):

REFLECTION-IN-ACTION

As you read, consider what the new nurse is thinking in the moment—what happened? How did the patient, family, and/or health care provider respond? What did the nurse do next?

SCENARIO

I was excited to be doing a senior year clinical rotation in an emergency room in a major city. We got very busy one evening during a Black Lives Matter protest following the shooting of a local, unarmed young Black man. Allegedly, some of the protestors became violent and started looting, and the police began using tear gas, rubber bullets and force for crowd control. We received a number of patients with eye damage, bruising, some broken bones, and bleeding. When I brought my concerns about one patient who was still sitting in the waiting room in obvious discomfort, needing to be seen, to the attention of one of the physicians, I was told that many of these patients got what was coming to them and not to worry. "These thugs are tough, they'll survive." I was startled to hear an opinion like this coming from a physician whose expertise I admired.

Effective Noticing (Cues)

1. What did you notice about the situation initially? What information/observations are significant? What information deviates from what is expected/normal/usual?

Effective Interpreting

2. How would you prioritize this data? What other assessment data, evidence and/or information would you need to consider the situation? How would you obtain this additional information?
3. What do you think about this situation? Consider personal and previous nursing experiences that you have had and formal knowledge (physiology, psychology, sociology, communication skills) that may be of assistance in providing care in this situation.

Scenario

Shocked by the physician's comment, I stepped back and returned to my duties with another patient. How could this physician even know if this was a peaceful protester or someone turned violent—and should that even matter? How in heaven's name could I effect change as a student and a guest in this emergency room? In school, we learned a lot about health equity and health disparities, and I was aware that not all patients received exactly the same care—but this racist comment shocked me into silence. I remembered that my code of ethics taught me to practice with compassion and respect for the inherent dignity, worth, and unique attributes of every person. What did this mean that evening in our busy emergency department? I didn't feel comfortable continuing to advocate for this patient, but I also didn't feel comfortable leaving him alone. Did I have any obligation to challenge the status quo? Later that night I had difficulty trying to fall asleep. I kept wondering about that patient and the many others like him, still facing indifference or worse from health care professionals on a daily basis.

Effective Responding

4. How would you describe the obligations you have in this scenario to your patient, to yourself, and to your team? Do you agree with the statement that being antiracist is not political rhetoric but is rather a moral imperative.
5. If you cannot fulfill each of these obligations how will you prioritize them? What basis/rationale do you use for prioritization? Remember that the ANA *Code of Ethics for Nurses* reminds us that nurses "are responsible for contributing to a moral environment that demands respectful interactions among colleagues, mutual peer support, and open identification of difficult issues, which include ongoing professional development of staff in ethical problem solving."

Effective Reflecting

6. This was not the first racist comment or behavior that this student observed in this hospital, which made

her question the institutional culture and ethical environment. As a student, she certainly wasn't in a position of power to effect change.

7. Do you agree with the choice the nurse made? Would you have made the same choice, why or why not? What would inform your decision? If the nurse had refused to back down and reported her concerns up the chain of command would you champion her cause?
8. Do you agree with the criteria the nurse used to evaluate her decision? How do you evaluate your clinical and moral judgments?
9. What resources can you access to better inform your decision?
10. Whether or not you would decide to challenge the physician, how might you use reflective practice to evaluate your decision so you can respond more confidently in the future? What criteria will you use to evaluate a good response?
11. What personal attributes and competencies are most likely to lead to a good response?

Reflection-on-Action

Then look back at the nurse's decisions and reflect on your learning—how did your knowledge and/or skills expand based on this scenario? What attitude, value, or belief shifts did you experience (if any) after reading this scenario? What would you do differently if you were in this situation? What more do you need to know to be able to manage this or a similar situation in the future?

Nielson, A., Stragnell, S., & Jester, P. (2007). Guide for reflection using the Clinical Judgment Model. *Journal of Nursing Education*, *46*(11), 513–516.

Vulnerable Population Alert: Caring for Patients Who Are Homeless

Depending on where you live and practice, you may rarely or frequently encounter patients who are homeless. People who are homeless do not have a regular and appropriate place to sleep at night, may include adults and children, and may be sheltered or unsheltered.

If your patient is homeless, how will this influence the treatment plan:

- for a patient with a newly diagnosed cancer?
- for someone who has been exposed to COVID-19 and needs to self-quarantine for 14 days?
- for a patient who needs IV antibiotics and daily dressing changes?
- for a patient in renal failure who needs dialysis?
- for a child who needs a liver small bowel transplant?

Health Disparities and COVID-19

In 2020, we definitely witnessed the dramatic consequences of health disparities. Writing in July 2020 (https://www.healthaffairs.org/do/10.1377/hblog20200716.620294/full/), Wen and Sadeghi commented that, with nearly 3 million confirmed COVID-19 cases and more than 131,000 deaths, communities of color are bearing the brunt of the pandemic.

> New federal data reveals that African Americans and Latinos in the U.S. have been three time more likely to contract COVID-19 than white residents and nearly twice as likely to die from it. Some counties with a majority of African American residents have almost six times the death rate compared to counties that are predominantly white. In some states such as Illinois, Latinos have nearly seven times the rate of COVID-19 cases compared to white peoples, while African Americans have the highest death rate.

Wen and Sadeghi explain that health disparities during the COVID-19 pandemic reflect two important patterns of inequity: (1) underrepresented communities have a higher likelihood of contracting the virus by living in urban areas and disproportionately working in higher-risk environments, and (2) racial minorities also experience higher rates of chronic medical conditions, including obesity, diabetes, and kidney disease, which are risk factors for severe illness from

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

COVID-19.

On August 4, 2020, the American Academy of Nursing and the American Nurses Association issued a call for social justice to address racism and health equity in communities of color (https://www.nursingworld.org/news/news-releases/2020/the-american-academy-of-nursing-and-the-american-nurses-association-call-for-social-justice-to-address-racism-and-health-equity-in-communities-of-color/). Noting that our Code of Ethics obligates nurses to be allies and to speak up against racism, discrimination, and injustice, the statement urges every nurse to:

> … remove areas of bias that perpetuate negative behaviors and reinforce harmful stereotypes and stigmas. This extends to those biases held by nurses and other health care providers. Working together, health professionals, public health officials, health care and industry leaders, system administrators, and policy makers, can confront and directly address these behaviors along with the unfair practices that lead to discrimination against Black and Brown individuals and communities of color. It is imperative in this time of incredible uncertainty and unrest, that we create and sustain cultures of understanding, belonging, open dialogue, and inclusion in workplaces, within our profession, and in communities. Commitment to addressing bias is a meaningful starting point to make lasting change.

Calling us to continued vigilance, the statement urges us to be change agents by responding to racism when we experience or see it occur, further our understanding of implicit and unconscious bias, and work within our own institutions to develop cultures of inclusivity. Moreover, we can advocate for policies at the local, state, and national level that address health equity, which will not only improve well-being now, but also continue to lay the foundation for better health in the future. See Box 3-3 for key resources on health disparities.

Nurse Self-Care Alert

The *Nursing: Scope and Standards of Practice* (ANA, 2021) reminds us that nurses must first respect themselves before being capable of respecting others. They must become clear on how equity, diversity, inclusion, and social justice inform them as people. This can be a difficult, painful exploration when meeting your own beliefs and biases. Box 3-4 outlines ANA Standard 9: Respectful and Equitable Practice. What work will you need to do to be able to practice with cultural humility and inclusiveness?

FACTORS AFFECTING HEALTH AND ILLNESS

As discussed, many factors influence a person's health status, health beliefs, and health practices. These factors may be internal or external and may or may not be under the person's conscious control. To plan and provide thoughtful, person-centered care, the nurse must understand how these factors influence behavior in both healthy and ill patients.

Basic Human Needs

A basic human need is something essential that must be met for emotional and physiologic health and survival. A person whose needs are met may be considered to be healthy, and a person who has one or more unmet needs is at an increased risk for illness. (Basic human needs are discussed in detail in Chapter 4.)

Human Dimensions

The factors influencing a person's health–illness status, health beliefs, and health practices relate to the person's human dimensions (see Fig. 3-1). Each dimension interrelates with each of the others and influences the person's behaviors in both health and illness. Nursing assessments of strengths and weaknesses in each dimension are used to develop a plan of care that is thoughtful, person-centered, and holistic. The nursing process, used to plan, implement, and evaluate plans of care, is discussed in Unit III.

Physical Dimension

The physical dimension includes genetic inheritance, age, developmental level, race, and sex assigned at birth. These components strongly influence the person's health status and health practices. For example, inherited genetic disorders include Down syndrome, hemophilia, cystic fibrosis, and color blindness. Toddlers are at greater risk for drowning, and adolescents and young adult males are at greater risk for automobile crashes from excessive speed. There are specific racial traits for disease, including sickle cell anemia, hypertension, and stroke. A young, biologically female person whose mother and grandmother had breast cancer is more likely to have an annual clinical breast examination and mammogram.

Emotional Dimension

How the mind affects body functions and responds to body conditions also influences health. Long-term stress affects body systems, and anxiety affects health habits; conversely, calm acceptance and relaxation can actually change the body's responses to illness. As examples of the negative effects of emotions, a student may always have diarrhea before examinations, and an adolescent with poor self-esteem may begin to experiment with drugs. Many researchers today are linking the rising deaths by suicide to a sense of meaninglessness related to the shrinking of the family and our sense of connectedness as well as the diminishing role of religion. The positive effects of emotions include reducing surgical pain with relaxation techniques and reducing blood pressure with biofeedback skills.

Box 3-4 **ANA Standard 9. Respectful and Equitable Practice**

The registered nurse practices with cultural humility and inclusiveness.

Competencies

The registered nurse:

- Demonstrates respect, equity, and empathy in actions and interactions with all health care consumers.
- Respects consumer decisions without bias.
- Participates in life-long learning to understand cultural preferences, worldviews, choices, and decision-making processes of diverse consumers.
- Reflects upon personal and cultural values, beliefs, biases, and heritage.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

- Applies knowledge of differences in health beliefs, practices, and communication patterns without assigning values to the differences.
- Considers the effects and impact of discrimination and oppression on practice within and among diverse groups.
- Uses appropriate skills and tools for the culture, literacy, and language of the individuals and population served.
- Communicates with appropriate language and behaviors, including the use of qualified health care interpreters and translators in accordance with consumer needs and preferences.
- Serves as a role model and educator for cultural humility and the recognition and appreciation of diversity and inclusivity.
- Identifies the cultural-specific meaning of interactions, terms, and content.
- Advocates for policies that promote health and prevent harm among diverse health care consumers and groups.
- Promotes equity in all aspects of health and health care.
- Advances organizational policies, programs, services, and practice that reflect respect, equity, and values for diversity and inclusion.

Knowledge of the emotional dimension would be important when planning care for **Sara Thurston**, the college freshman described at the beginning of the chapter. The nurse needs to examine how she responds to stress and anxiety.

Intellectual Dimension

The intellectual dimension encompasses cognitive abilities, educational background, and past experiences. Whether or not someone can understand the causes of disease and the importance of healthy lifestyle behaviors can have a huge impact on health and wellness. These influence the person's responses to teaching about health and reactions to nursing care during illness. They also play a major role in health behaviors. Examples involving this dimension include a young college student with diabetes who follows a diabetic diet but drinks beer and eats pizza with friends several times a week, and a middle-aged man who quits taking his high blood pressure medication after developing unpleasant side effects.

Environmental Dimension

The environment has many influences on health and illness. Housing, sanitation, climate, and pollution of air, food, and water are elements in the environmental dimension. Examples of environmental causes of illness include deaths in older adults from inadequate heating and cooling; an increased incidence of asthma and respiratory problems in large cities with smog; and an increased incidence of skin cancer in people who live in hot, sunny areas of the world.

Sociocultural Dimension

Health practices and beliefs are strongly influenced by a person's economic level, lifestyle, family, and culture. In general, low-income groups, racial and ethnic minorities, and other underserved populations are less likely to seek medical care to prevent illness and have fewer treatment options, while high-income groups are more prone to stress-related habits and illness. The family and the culture to which a person belongs influence the person's patterns of living and values about health and illness; such patterns are often unalterable. All of these factors are involved in personal care, patterns of eating, lifestyle habits, and emotional stability. Examples of other sociocultural situations that influence health and illness are an adolescent who sees nothing wrong with smoking or drinking because their parents smoke and drink; and parents of a sick infant who do not seek medical care because they have no health insurance.

Spiritual Dimension

Spiritual beliefs and values are important components of a person's health and illness behaviors (see Chapter 47). It is important that nurses respect these values and understand their importance for the individual patient. Examples of the influences of the spiritual dimension on health care include the Roman Catholic requirement of baptism for both live

births and stillborn babies; kosher dietary laws, prohibiting the intake of pork and shellfish, practiced by Orthodox and Conservative Jews; and opposition to blood transfusion, common to Jehovah's Witnesses. Perhaps most importantly, as noted above, religion allows people to feel as if they are a part of something larger than themselves and more meaningful than their individual lives, which promotes resilience.

Self-Concept

Another variable influencing health and illness is a person's self-concept (see Chapter 42), which incorporates both how they feel about themselves (self-esteem) and the way they perceive their physical self (body image). Self-concept has both physical and emotional aspects and is an important factor in the way a person reacts to stress and illness, follows self-care health practices, and relates to others.

Consider **Sara Thurston**, the college freshman with a suspected eating disorder. Although she has lost a significant amount of weight, she states that she is healthy but just "nuts" about being fit. Her self-concept is most likely one of being overweight. Consequently, she rarely eats. In contrast, people who are overweight may feel that nothing will change the way they look and refuse to follow a diet and exercise program.

A person's self-concept results from a variety of past experiences, interpersonal interactions, physical and cultural influences, and education. It includes perceptions of one's own strengths and weaknesses. Illness can alter a person's self-concept, as it affects roles, independence, and relationships with important others.

Risk Factors for Illness or Injury

A **risk factor** is something that increases a person's chances for illness or injury. Like other components of health and illness, risk factors are often interrelated. Risk factors may be further defined as modifiable (things a person can change, such as quitting smoking) or nonmodifiable (things that cannot be changed, such as a family history of cancer). As a person's number of risk factors increases, so does the possibility of illness. For example, an executive who is overweight and is under pressure to increase sales may smoke and drink alcohol in excess. These factors, combined with a family history of heart disease, place this person at higher risk for illness.

Table 3-1 Major Areas of Risk Factors

RISK FACTOR	EXAMPLES
Age	School-aged children are at high risk for communicable diseases.
	After menopause, females are more likely to develop cardiovascular disease.
Genetic factors	A family history of cancer or diabetes predisposes a person to developing the disease.
Physiologic factors	Obesity increases the possibility of heart disease.
	Pregnancy places increased risk on both the pregnant person and the developing fetus.
Health habits	Smoking increases the probability of lung cancer.
	Poor nutrition can lead to a variety of health problems.
Lifestyle	Multiple sexual relationships increase the risk for sexually transmitted infections (e.g., gonorrhea or AIDS).
	Events that increase stress (e.g., divorce, retirement, work-related

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

	pressure) may precipitate accidents or illness.
Environment	Working and living environments (such as those where hazardous materials and poor sanitation are present) may contribute to disease.

Remember **Daniel Sternman**, the man with schizophrenia. The Mayo Clinic (2019) had identified the following as risk factors for developing mental problems: having a blood relative with a mental illness; stressful life situations, such as financial problems or a loved one's death or divorce; an ongoing chronic medical condition; brain damage as a result of serious injury; traumatic experiences; use of alcohol or recreational drugs; being abused or neglected as a child; having few friends or few healthy relationships; and a previous mental illness.

The six general types of risk factors are described in Table 3-1. Risk factors for each developmental level across the lifespan are included in Unit IV, and cultural influences on risk factors are discussed in Chapter 5.

HEALTH PROMOTION AND ILLNESS PREVENTION

Health promotion is the behavior of a person who is motivated by a personal desire to increase well-being and health potential. In contrast, illness/disease prevention, also called health protection, is behavior motivated by a desire to avoid or detect disease or to maintain functioning within the constraints of an illness or disability (Murdaugh et al., 2019). Health promotion and illness prevention activities are traditionally described as occurring on primary, secondary, and tertiary levels (Leavell & Clark, 1965). Definitions and examples of nursing activities for each level are discussed in the next section and are detailed in Table 3-2.

Table 3-2 Examples of Nursing Activities by Level of Health Promotion and Preventive Care

LEVEL	TOPIC
Primary	Weight loss
	Diet
	Exercise
	Smoking cessation
	Reduced alcohol consumption
	Avoidance of illicit drugs
	Farm safety
	Seat belts and child safety seats
	Immunizations
	Water treatment
	Safer sex practices
	Effective parenting
Secondary	Screenings (blood pressure, cholesterol, glaucoma, HIV, skin cancer)

	Pap smears
	Mammograms
	Testicular examinations
	Family counseling
Tertiary	Medication
	Medical therapy
	Surgical treatment
	Rehabilitation
	Physical therapy
	Occupational therapy
	Job training

Primary Health Promotion and Illness Prevention

Primary health promotion and illness prevention are directed toward promoting health and preventing the development of disease processes or injury. Nursing activities at the primary level may focus on people or groups. Examples of primary-level activities are immunization clinics, family-planning services, providing poison-control information, and accident-prevention education. Other nursing interventions include teaching about a healthy diet, the importance of regular exercise, safety in industry and farms, using seat belts, using social distancing and face masks during the pandemic, and safer sex practices.

Health-risk assessments are an important part of primary health promotion and preventive care. A health-risk assessment is an assessment of the total person. The resulting "picture" of the person indicates areas of risk for disease or injury as well as areas that support health. A variety of formats are used to perform this assessment, but all take a broad approach to health, focusing on lifestyle and behaviors. Box 3-5 (on pages 68–69) contains an example of a health-style self-test the patient completes. As you work with patients in both hospital and community settings to provide care, use this self-test to help your patients assess their state of health and health risks and learn a new health style through recommended lifestyle practices that support health. But first use it to assess your own state of health and health risks.

Box 3-5 **Health-Style Self-Test**

All of us want good health, but many of us do not know how to be as healthy as possible. Health experts now describe *lifestyle* as one of the most important factors affecting health. In fact, it is estimated that as many as 7 of the 10 leading causes of death could be reduced through common-sense changes in lifestyle. That's what this brief test, developed by the Public Health Service, is all about. Its purpose is simply to tell you how well you are doing to stay healthy. The behaviors covered in the test are recommended for most Americans. Some of them may not apply to people with certain chronic diseases or disabilities, or to pregnant people. Such people may require special instructions from their health care providers.

Cigarette Smoking

If you *never smoke* enter a score of 10 for this section and go to the next section on Alcohol and Drugs.

almost always 2 sometimes 1 almost never 0

1. I avoid smoking cigarettes.

2 1 0 2. I smoke only low-tar and nicotine cigarettes *or* I smoke a pipe or cigars.

Smoking score: _____

Alcohol and Drugs

almost always 2 sometimes 1 almost never 0

1. I avoid drinking alcoholic beverages *or* I drink no more than one or two drinks a day.

2 1 0 2. I avoid using alcohol or other drugs (especially illegal drugs) as a way of handling stressful situations or the problems in my life.

2 1 0 3. I am careful not to drink alcohol when taking certain medicines (e.g., medicine for sleeping, pain, colds, and allergies), or when pregnant.

2 1 0 4. I read and follow the label directions when using prescribed and over-the-counter drugs.

Alcohol and drugs score: _____

Eating Habits

almost always 2 sometimes 1 almost never 0

1. I eat a variety of foods each day, such as fruits and vegetables, whole-grain breads and cereals, lean meats, dairy products, dry peas and beans, and nuts and seeds.

2 1 0 2. I limit the amount of fat, saturated fat, and cholesterol I eat (including fat on meats, eggs, butter, cream, shortenings, and organ meats such as liver).

2 1 0 3. I limit the amount of salt I eat by cooking with only small amounts, not adding salt at the table, and avoiding salty snacks.

2 1 0 4. I avoid eating too much sugar (especially frequent snacks of sticky candy or soft drinks).

Eating habits score: _____

Exercise and Fitness

almost always	sometimes	almost never		
2	1	0	1.	I maintain a desired weight, avoiding overweight and underweight.
2	1	0	2.	I do vigorous exercises for 15 to 30 minutes at least three times a week (examples include running, swimming, brisk walking).
2	1	0	3.	I do exercises that enhance my muscle tone for 15 to 30 minutes at least three times a week (examples include yoga and calisthenics).
2	1	0	4.	I use part of my leisure time participating in individual, family, or team activities that increase my level of fitness (such as gardening, bowling, golf, and baseball).

Exercise/fitness score: _____

Stress Control

almost always	sometimes	almost never		
2	1	0	1.	I have a job or do other work that I enjoy.
2	1	0	2.	I find it easy to relax and express my feelings freely.
2	1	0	3.	I recognize early, and prepare for, events or situations likely to be stressful for me.
2	1	0	4.	I have close friends, relatives, or others whom I can talk to about personal matters and call on for help when needed.
2	1	0	5.	I participate in group activities (such as church and community organizations) or hobbies that I enjoy.

Stress control score: _____

Safety

almost always	sometimes	almost never		
2	1	0	1.	I wear a seat belt while riding in a car.
2	1	0	2.	I avoid driving while under the influence of alcohol and other drugs.
2	1	0	3.	I obey traffic rules and the speed limit when driving.
2	1	0	4.	I am careful when using potentially harmful products or substances (such as household cleaners, poisons, and electrical devices).
2	1	0	5.	I avoid smoking in bed.

Safety score: _____

What Your Scores Mean to You

Scores of 9 and 10

Excellent! Your answers show that you are aware of the importance of this area to your health. More important, you are putting your knowledge to work for you by practicing good health habits. As long as you continue to do so, this area should not pose a serious health risk. It's likely that you are setting an example for your family and friends to follow. Because you got a very high test score on this part of the test, you may want to consider other areas where your scores indicate room for improvement.

Scores of 6 to 8

Your health practices in this area are good, but there is room for improvement. Look again at the items you answered with "Sometimes" or "Almost never." What changes can you make to improve your score? Even a small change can often help you achieve better health.

Scores of 3 to 5

Your health risks are showing! Would you like more information about the risks you are facing and about why it is important for you to change these behaviors? Perhaps you need help in deciding how to make the changes you desire. In either case, help is available.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Scores of 0 to 2

Obviously, you were concerned enough about your health to take the test, but your answers show that you may be taking serious and unnecessary risks with your health. Perhaps you are unaware of the risks and what to do about them. You can easily get the information and help you need to improve, if you wish. The next step is up to you.

Suggested Self-Care Behaviors

Start by asking yourself a few frank questions: *Am I really doing all I can to be as healthy as possible? What steps can I take to feel better? Am I willing to begin now?* If you scored low in one or more sections of the test, decide what changes you want to make for improvement. You might pick that aspect of your lifestyle where you feel you have the best chance for success and tackle that one first. Once you have improved your score there, go on to other areas.

Lifestyle practices that promote health include:

- Sleeping regularly, 7 to 8 hours per night
- Eating regular meals, which include recommended food groups
- Maintaining ideal body weight
- Having a regular schedule of exercise
- Using alcohol in moderation, if at all
- Not smoking
- Maintaining positive mental health and self-concept
- Practicing safer sex
- Wearing seatbelts, using car seats for children, and wearing bicycle helmets
- Having recommended screenings and checkups by your medical and dental health care providers

If you already have tried to change your health habits (e.g., to stop smoking or exercise regularly), don't be discouraged if you haven't yet succeeded. The difficulty you have encountered may be due to influences you've never really thought about—such as advertising—or to a lack of support and encouragement. Understanding these influences is an important step toward changing the way they affect you.

There's help available. In addition to personal actions you can take on your own, there are community programs and groups (such as the YMCA or the local chapter of the American Heart Association) that can assist you and your family to make the changes you want to make. If you want to know more about these groups or about health risks, contact the National Health Information Center (https://health.gov/our-work/health-literacy/resources/national-health-information-center).

There's a lot you can do to stay healthy or to improve your health, and there are organizations that can help you. Start a new "health style" today!

The patient-centered assessment method (PCAM) is a tool nurses can use to assess patient complexity using the social determinants of health that often explain why some patients engage and respond well in managing their health, while others with similar health conditions do not experience the same outcomes (see the PCAM tool in Chapter 15, Fig. 15-4). You are best able to recognize factors affecting peoples' ability to manage their health care if you pay attention to their health and well-being (lifestyle behaviors, impact of their physical health on their mental health, and their ability to enjoy daily activities), their social environment (status of employment, housing, transportation, and social networks), and their health literacy and communication skills (understanding of their symptoms and risk factors, language and cultural differences, and learning difficulties).

Concept Mastery Alert

During primary prevention, teaching is an important activity. However, before teaching can be initiated, it is essential that the nurse engage the patient in a discussion about their health risks and the implications of these risks. Then, once the risks are identified, the nurse can develop a patient-specific teaching strategy to help the patient address the risks.

Secondary Health Promotion and Illness Prevention

Secondary health promotion and illness prevention focus on screening for early detection of disease with prompt diagnosis and treatment of any found. The goals of secondary preventive care are to identify an illness, reverse or reduce its severity or provide a cure, and thereby return the person to maximum health as quickly as possible. The Patient Protection and Affordable Care Act (ACA) of 2010, which broadens the scope of preventive care, also helps reduce health disparities so that underserved groups can reach their full health potential. Examples of nursing activities at this level are assessing children for normal growth and development and encouraging regular medical, dental, and vision examinations. Proposals to repeal the ACA are placing these preventive care options in jeopardy. Other activities include

screenings (e.g., blood pressure, cholesterol, skin cancer), recommending gynecologic examinations and mammograms for females at appropriate ages, and teaching testicular self-examination to males. Direct nursing care interventions at the secondary level include administering medications and caring for wounds.

Concept Mastery Alert

Screenings are a major activity involved in secondary health promotion.

Tertiary Health Promotion and Illness Prevention

Tertiary health promotion and illness prevention begins after an illness is diagnosed and treated, with the goal of reducing disability and helping rehabilitate patients to a maximum level of functioning. Nursing activities on a tertiary level include teaching a patient with diabetes how to recognize and prevent complications, using physical therapy to prevent contractures in a patient who has had a stroke or spinal cord injury, and referring a patient to a support group after removal of a breast because of cancer. Nurses play an important role in monitoring the responses of the patient to the prescribed therapy and in providing services to facilitate the patient's recovery or improve quality of life while living with the effects of an illness or injury.

Think back to **Sara Thurston**, the college freshman. If she is diagnosed with an eating disorder, the nurse would use tertiary preventive care by referring the patient to an eating disorders support group. For Ruth Jacobi, the woman being discharged after a mini-stroke, tertiary preventive care would include educating her about the warning signs and symptoms of a major stroke and about measures to reduce her risk.

MODELS OF HEALTH PROMOTION AND ILLNESS PREVENTION

Models of why and how people behave in ways to promote health and prevent illness help health care providers understand health-related behaviors and adapt care to people from diverse economic and cultural backgrounds. This knowledge can be used to overcome barriers to health from disparities in care resulting from such factors as the increasing number of people without health insurance, a predicted increase in underrepresented populations, and a lack of accessible and essential health care services for low-income and rural populations.

Health Belief Model

Free or low-cost screens and health information are available in most areas to help detect disease early and to educate people about healthy living. Why, then, don't more people take advantage of these services or change their lifestyles? This question can be answered with the widely used health belief model, which describes health behaviors.

The health belief model (Rosenstock, 1974) focuses on what people perceive or believe to be true about themselves in relation to their health. This model is based on three components of individual perceptions of threat of a disease: (1) perceived susceptibility to a disease, (2) perceived seriousness of a disease, and (3) perceived benefits of action.

Perceived susceptibility to a disease is the belief that one either will or will not contract a disease. It ranges from being afraid of developing a disease to completely denying that certain behaviors may cause illness. For example, one person who smokes cigarettes may believe they are at risk for lung cancer and may stop smoking, while another person may believe smoking poses no serious threat and continues to smoke.

Perceived seriousness of a disease concerns the person's perception of the threat that disease poses to health and its effects on the person's lifestyle. Perceived seriousness depends on how much the person knows about the disease and can result in a change in health behavior. If a person who smokes knows that lung cancer can cause physical disability or death and therefore affect their ability to work and care for the family, the person is more likely to stop smoking.

The perceived benefits of action are the person's beliefs about how effectively measures will prevent illness. This factor is influenced by the person's conviction that carrying out a recommended action will prevent or modify the disease and by the person's perception of the cost and unpleasant effects of performing the health behavior (compared with not taking any action). For example, the person may believe that stopping smoking will prevent future breathing problems and that the initial withdrawal symptoms can be overcome; therefore, they may stop smoking.

In addition to these three components, a person's health beliefs are affected by modifying factors including

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

demographic variables (such as age and sex assigned at birth), sociopsychologic variables (such as personality and peer group pressure), and structural variables (such as knowledge and prior contact with the disease). These factors interact to influence the perceived benefits of preventive action minus the perceived barriers to preventive action. Another modifying factor is a cue to action, including activities such as others' advice, mass-media campaigns, literature, appointment-reminder telephone calls or postcards, and the illness of a significant other. The likelihood of taking a recommended preventive health action is thus a composite of individual perceptions and modifying factors. We saw this dramatically when research revealed that teens and young adults who vaped were five to seven times more likely to be infected with COVID-19 than those who did not use e-cigarettes (Gaiha et al., 2020). A belief that their youth will protect them or that their symptoms will not be severe (both of which are not true) reduces their likelihood of stopping vaping. Recent research indicates that self-efficacy should be added as another component of the health belief model. Self-efficacy, one's own belief in the ability to reach goals and complete tasks, is a strong influence on a person's choices, particularly regarding health behaviors (Murdaugh et al., 2019).

The health belief model is useful when teaching about health and illness. You can assess the patient's related beliefs and together structure goals to help realistically meet health needs. Teaching and health promotion activities are ineffective, however, unless the patient believes that they are important and necessary. How would you use the health belief model to change teen vaping behaviors?

Consider **Ruth Jacobi**, the woman being discharged after a mini-stroke. The patient indicates that she is positively motivated to achieve health, providing the nurse with valuable information about her health beliefs. Together, the nurse and patient can determine realistic goals. The nurse, then, could use this model to develop the patient's teaching plan, including information about the underlying disease process, risk factors for stroke, and ways to reduce the patient's risk for a major stroke.

Health Promotion Model

The health promotion model (Murdaugh et al., 2019) was developed to illustrate how people interact with their environment as they pursue health. The model incorporates individual characteristics and experiences, as well as behavior-specific knowledge and beliefs, to motivate health-promoting behavior. Nurses can use the components of the model to design and provide interventions to promote health for people, families, and communities.

Individual characteristics and experiences can be useful to predict if a person will incorporate and use health-related behaviors. If a behavior has been used before and becomes a habit, it is more likely to be used again. Personal biologic, psychological, and sociocultural factors—including age, sex assigned at birth, strength, self-esteem, perceived health status, definition of health, acculturation, and socioeconomic status—all help predict a given health-related habit. For example, the person who has high self-esteem, defines self as healthy, and has an adequate income is less likely to use alcohol or tobacco and more likely to follow a healthy diet and take part in regular exercise. Conversely, a person with low self-esteem, a fatalistic attitude toward health, and low socioeconomic status is more likely to have poor nutrition, not exercise, and use addictive substances.

Behavior-specific knowledge, beliefs, and relationships are considered major motivators for health-promoting behaviors. These include the knowledge that that there will be a positive outcome from a specific health behavior, the belief that one has the skill and competence to engage in health behaviors, and the influences of others (especially family, peers, and health care providers). Situational influences, such as no-smoking policies, also influence health behaviors. Barriers to action, which include perceptions of unavailability, inconvenience, expense, difficulty, or time, usually result in avoidance of a behavior.

A revised health promotion model includes three additional variables: activity-related affect, a commitment to a plan of action, and immediate competing demands and preferences. Behaviors may induce either a positive or negative subjective response or affect. If the activity initiates a positive reaction, the behavior will likely be repeated; if the emotional reaction is negative, the person will likely avoid that behavior. A person initiates a health-related behavior by committing to a plan of action, accompanied by developing associated strategies to perform the valued behavior. Failure to sustain the behavior may result from competing demands. For example, a person may begin a low-fat diet but "give in" to the convenience of fast foods. Health-related behavior is the outcome of the model and is directed toward attaining

positive health outcomes and experiences throughout the lifespan (Murdaugh et al., 2019).

Health–Illness Continuum

The health–illness continuum is one way to conceptualize a person's level of health. This model views health as a constantly changing state, with high-level wellness and death at opposite ends of a graduated scale, or continuum (Fig. 3-5). This continuum illustrates the ever-changing state of health as a person adapts to changes in internal and external environments to maintain a state of well-being. For example, patients with cancer may view themselves at different points on the continuum at any given time, depending on how well they believe they are functioning with the illness.

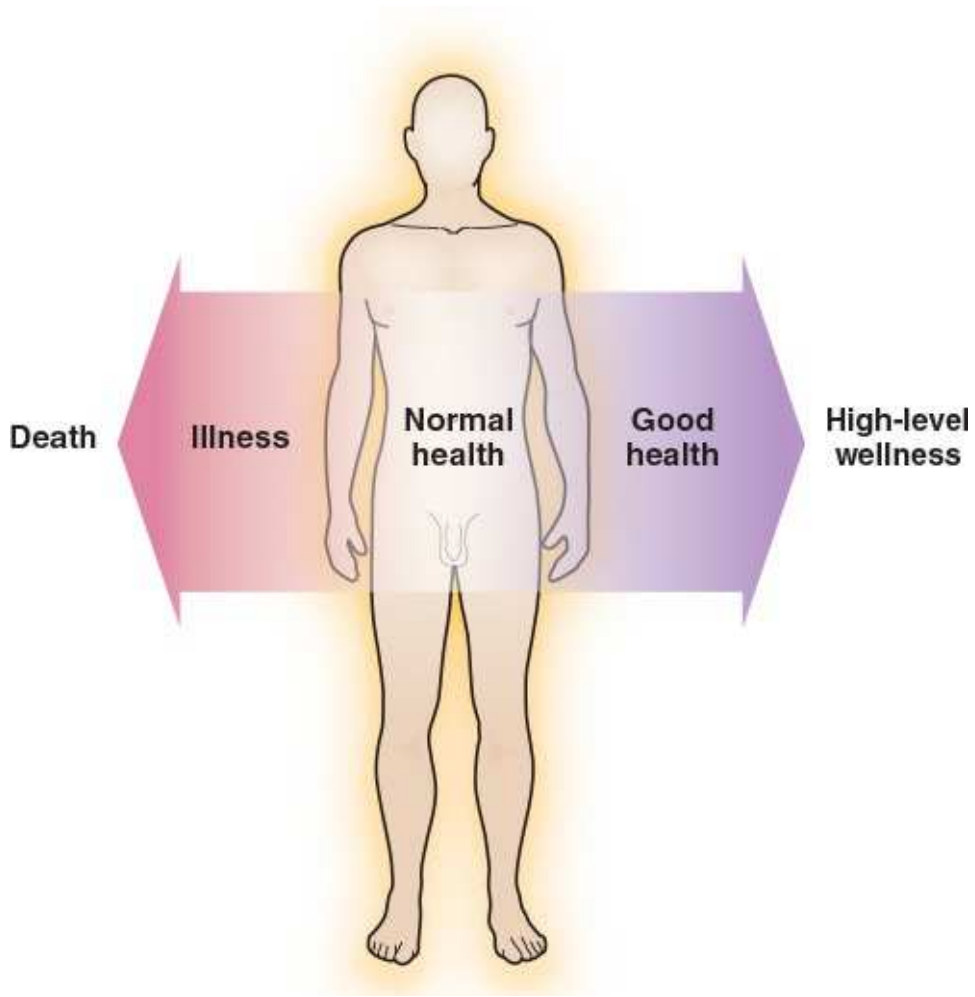

FIGURE 3-5. The health–illness continuum.

Think back to **Sara Thurston**, the college freshman described in the Reflective Practice display. The nurse could apply the health–illness continuum model when assessing this patient, recognizing that the stressors of college life have resulted in a shift along the continuum for this patient away from high-level wellness.

Agent–Host–Environment Model

The agent–host–environment model of health and illness, developed by Leavell and Clark (1965), views the interaction between an external agent, a susceptible host, and the environment as causes of disease in a person. It is a traditional model that explains how certain factors place some people at risk for an infectious disease—a model that is currently helpful in addressing COVID-19. These factors are constantly interacting, and a combination of factors may increase the risk of illness. The use of this model is limited when dealing with noninfectious diseases, and other models have proved more useful.

Stages of Change Model

Prochaska and DiClemente developed the Stages of Change Model in the late 1970s and early 1980s while trying to help people with addictions. The model is widely used today by counselors addressing a broad range of behaviors including injury prevention, overcoming drug and alcohol addictions, and weight loss. Figure 3-6 illustrates stages in the model. As you read brief descriptions of the stages below, think about the communication and interventions nurses might use in

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

each stage to help someone change problematic behaviors.

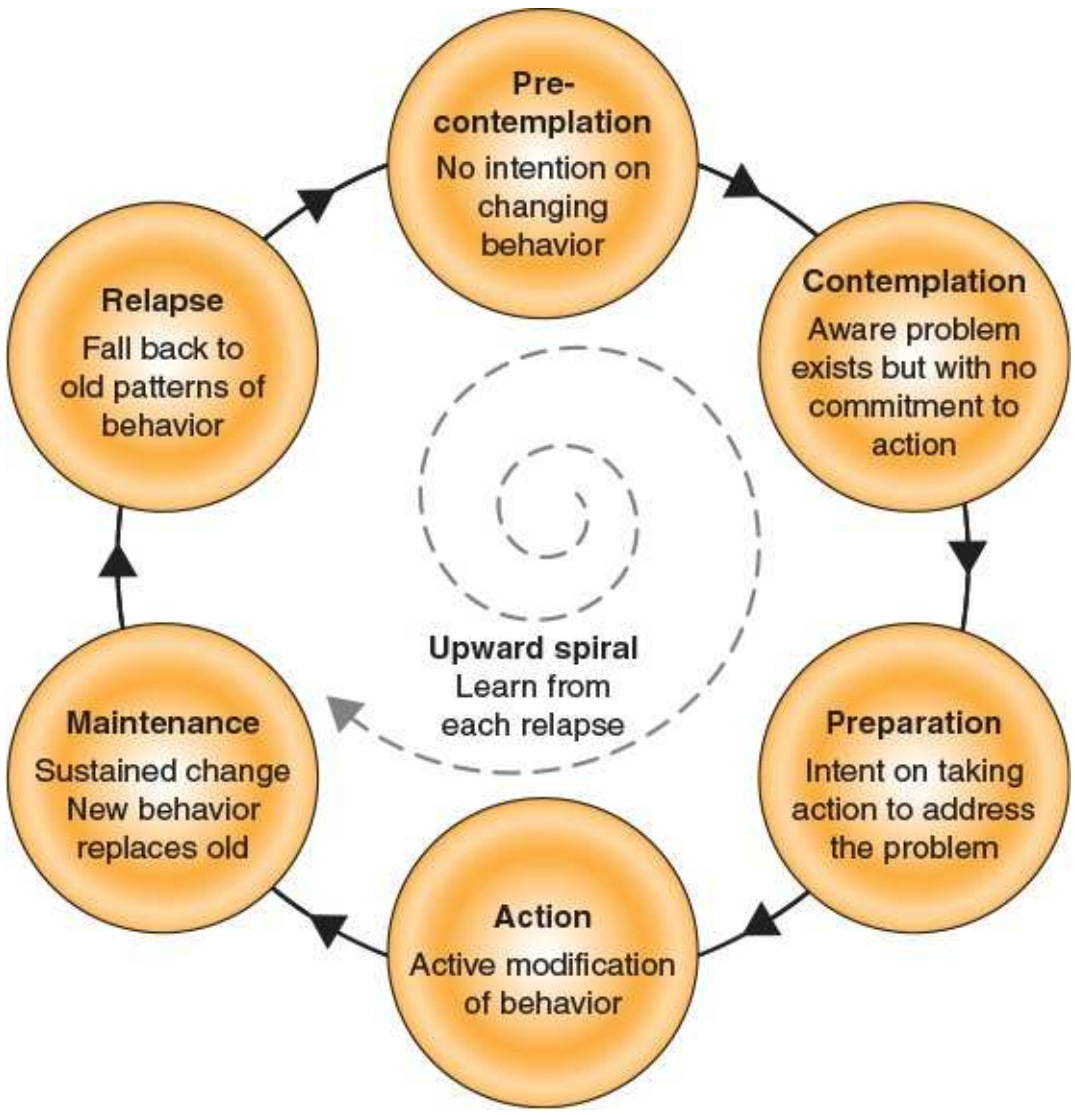

FIGURE 3-6. Prochaska and DiClemente's stages of change model. (*Source:* Adapted from Prochaska, J. O., & DiClemente, C. C. [1983]. Stages and processes of self-change of smoking: toward an integrative model of change. *Journal of Consulting and Clinical Psychology*, *51*[3], 390–395.)

Precontemplation. In this stage, people are not even thinking about trying to change their behavior. DiClemente lists as reasons the four Rs: reluctance, rebellion, resignation, and rationalization. Counselors can validate the lack of readiness to change and encourage self-exploration.

Contemplation. People ambivalently consider the need to change the problematic behavior. Counselors can help by focusing on educating about the pros and cons of the behavior and change, and clarify that the decision to change is one that only the individual can make.

Determination: Commitment to Action. Now the decision is made to move forward and preparation ensues. Counselors are most helpful in this stage by helping people make realistic plans, with small steps that anticipate difficulties, and by identifying creative strategies to address the difficulties. It is helpful to affirm that the individual has the ability to change behaviors.

Action: Implementing the Plan. When someone publicly begins to implement the plan and begins to achieve success, it reinforces the decision to change behavior. If family, friends, and coworkers understand that the person has decided to eat differently or stop drinking, they can become supporters. Counselors can bolster the person's ability to change by reiterating long-term benefits.

Maintenance, Relapse, and Recycling. During this stage, people focus on sustaining the new behavior in a stage that can last from 6 months to 5 years. Counselors can be helpful by exploring strategies to support the new behaviors and by continuing support during relapse.

NURSING CARE TO PROMOTE HEALTH AND PREVENT ILLNESS

The current focus on health promotion and illness prevention at local, state, national, and global levels is important to nursing. Chapter 1 provides information about Healthy People 2030, a national agenda to promote health. The "Healthy People Tools and Resources" page on the Healthy People 2020 website (https://www.healthypeople.gov/2020/tools-resources) identifies tools and evidence-based resources nurses can use to improve the health of their community. See Chapters 4 and 12 for other suggestions. Chapters 23 and 24 discuss recommended screenings, immunizations, and safety practices across the lifespan.

Nurse Self-Care Alert

As emphasized in Chapter 1, nurses must take care of their own health to be able to give effective nursing

care to others. Good personal health enables nurses not only to practice more efficiently but also to serve as role models for patients and families. Nurses can help patients acquire new health behaviors by modeling the very behaviors they are trying to promote. It is difficult for nurses to be sincerely attentive to the needs of patients when their own needs are not being met. Because no one is perfectly healthy all of the time, nurses who are preparing for professional practice should spend time getting to know themselves. From this self-knowledge should come a commitment to actively pursue holistic health. See healthynurse@ana.org and respond to the Healthy Nurse, Healthy Nation Grand Challenge (Dawson, 2017). To help you increase your self-knowledge, complete the health-style self-test in Box 3-5 on pages 68–69.

Concept Mastery Alert

Primary role is not the same as primary prevention. Primary role is individually directed, whereas primary prevention focuses on activities that foster health for individuals, groups, and communities.

The Promoting Health boxes highlighted throughout this text may also be useful to you as well as to your patients. Use these guides to assess and identify both your strengths and risks for alterations in health. The guides can also serve as a basis for teaching self-care to patients.

As we move further into the 21st century, resources for health care practices for self and others, along with knowledge of health care trends, can help promote health and advocacy for patients and families of all ages and in all settings. Eliminating disparities in health care improves the quality of life for all people. Examples of nurse-led interventions that reduce disparities and provide access to quality health care include:

- A nurse-led clinic in an urban area in Milwaukee, Wisconsin, was established to treat low-income uninsured patients with hypertension and diabetes. Interventions include laboratory tests, low-cost medications, free patient education, and consultations as needed. This program was specifically designed "to reduce excessive wait times, inconvenient locations, and a lack of cultural awareness by health care providers" (Melville, 2011).
- A postdischarge, nurse-led clinic in San Francisco, California, helps patients transition from the inpatient to outpatient setting. This bridge clinic serves vulnerable populations including new immigrants, substance abusers, people experiencing homelessness, and mentally ill patients. Outreach activities include review of medications, assessment of new symptoms, health promotion and education, and referrals as needed. Surveys of these patients have demonstrated significant improvement in self-management for these vulnerable populations (Newbold et al., 2012).
- Residents of impoverished communities in Philadelphia, Pennsylvania, can receive a variety of services at one location. The Family Practice and Counseling Network (FPCN) includes three nurse-led health centers that provide immediate and long-term health care coordinated by a team of nurses including registered and advance practice registered nurses. This care coordination facilitates communication and produces quality patient outcomes (Trossman, 2012).

DEVELOPING CLINICAL REASONING AND CLINICAL JUDGMENT

. Identify a family in which someone has a chronic illness. Interview as many of the other family members as possible, and discuss the effect of the illness on them. What do you observe about the effects of the illness in relation to the patient's age, type of illness (e.g., AIDS vs. cancer), sex assigned at birth, and family role?
. List the six human dimensions described in this chapter, and identify your personal strengths and weaknesses in each area. For example, you may have inherited a genetic tendency toward being overweight (a weakness), but have controlled your weight through nutrition and exercise (a strength). After considering your strengths and weaknesses, develop a personal plan for health promotion.
. In what ways can poverty, race or ethnic group, lack of education, and poor social support influence health outcomes? Does current information about the biologic and genetic characteristics of underrepresented and underserved populations explain the health disparities experienced by these groups? For example is race or racism a risk for many different types of health problems? Can you identify additional barriers that interfere with quality health care?
. Not infrequently, nurses become the target of disrespect, racist beliefs, and biases. How would you respond if a White new father asked you to post a sign in the nursery stating that no Black nurses were to touch his baby? What if a patient told you that they didn't want you to be their nurse because of your race, ethnicity, gender, or any other aspect of your identity?
. Review your institution's policies on sexual misconduct and assault. One in 5 women and 1 in 16 men will face sexual assault while in college, according to a government report. What is your perception of your risk for sexual assault or misconduct? Describe the model of health professional nurses might use to reduce sexual misconduct on campus. What is it about this model that makes it ideal for addressing this challenge?

PRACTICING FOR NCLEX

. A nurse working in an ambulatory care center provides care for patients experiencing varying levels of health and

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

illness. The nurse bases care on which concepts of health and illness? Select all that apply.

a. Health and illness are the same for all people.
b. Health and illness are individually defined by each person.
c. People with acute illnesses may consider themselves healthy.
d. People with chronic illnesses have poor health beliefs.
e. Health is more than the absence of illness.
f. Illness is the response of a person to a disease.

. A community health nurse is developing a support group for patients coping with chronic health problems. What chronic health conditions does the nurse anticipate group members might want to discuss? Select all that apply.

a. Diabetes mellitus
b. Bronchial pneumonia
c. Rheumatoid arthritis
d. Ulcerative colitis
e. Fractured hip
f. Otitis media

. Nurses from hospital in a low-income area of the city are developing educational materials and programs focused on health care for vulnerable populations. When planning community outreach, which members of the community will the nurses include? Select all that apply.

a. White male diagnosed with HIV
b. Black teenager who is 6 months pregnant
c. Hispanic male who has type 2 diabetes
d. Low-income family living in rural America
e. Middle-class teacher living in a large city
f. White infant born with cerebral palsy

. A nurse has volunteered to give influenza immunizations at a local health clinic. In which level of health promotion and illness prevention is the nurse participating?

a. Tertiary
b. Secondary
c. Primary
d. Promotive

. A community health nurse cares for vulnerable populations. What problem will the nurse prioritize for a patient who is homeless?

a. Love and belonging
b. Safety
c. Self-esteem
d. Self-actualization

. A clinic nurse works with a population experiencing health disparities. Which patient does the nurse identify as having the highest risk for postponing annual breast examinations and mammograms?

a. Patient whose best friend had a benign breast lump removed
b. Patient who lives in a low-income neighborhood
c. Patient who has a family history of breast cancer
d. Patient whose family encourages regular physical examinations

. A nursing student is writing a paper about nurses performing health promotion activities at the tertiary level. Which nursing actions will the student include? Select all that apply.

a. Running an immunization clinic in a lower-income area of a city
b. Teaching a patient with an amputation how to care for the residual limb
c. Providing range-of-motion exercises for a patient who is paralyzed
d. Teaching parents of toddlers how to childproof their homes
e. Providing screening for scoliosis for school students
f. Teaching new parents how to choose and use an infant car seat

. A nurse is caring for a patient who has been managing their chronic spasticity well for 10 years. The patient states having had increasing spasticity and few falls due to unremitting muscle spasms. The nurse, patient, and health care provider discuss the possibility the patient may be experiencing which phase of illness?

a. Acute onset of illness
b. Permanent complication
c. Need for hospice care
d. Exacerbation of disease

. A nurse incorporates concepts from current models of health when providing health promotion classes for patients. What is a key concept of both the health–illness continuum and the high-level wellness models?

a. Illness as a fixed point in time
b. The importance of family
c. Wellness as a passive state
d. Health as a dynamic state

. A public health nurse is planning interventions for a community and plans to determine the frequency of diseases in the area. What information will best guide the nurse?

a. Morbidity table
b. Disease eradication statistics
c. Mortality rates
d. Annual hospital admissions

ANSWERS WITH RATIONALES

. **b, c, e, f.** Each person defines health and illness individually, based on a number of factors. Health is more than just the absence of illness; it is an active process in which a person moves toward their maximum potential. An illness is the response of the person to a disease.

. **a, c, d.** Diabetes, arthritis, and ulcerative colitis are chronic diseases causing permanent, irreversible alterations in normal anatomy and/or physiology. They require a lengthy period of care, support, and patient education. Pneumonia, fractures, and otitis media are acute illnesses, characterized by a rapid onset and typically short duration.

. **b, c, d, f.** National trends in the prevention of health disparities are focused on vulnerable populations, such as racial and ethnic minorities, those living in poverty, women, children, older adults, residents of rural areas and lower-income areas of cities, and people with disabilities and special health care needs.

. **c.** Giving influenza injections is an example of primary health promotion and illness prevention. Secondary prevention includes early detection of disease with prompt diagnosis and treatment. Tertiary prevention focuses on reducing disability and providing rehabilitation to a maximum level of functioning.

. **b.** Safety is the most appropriate focus as adults and children experiencing homelessness do not have a regular and appropriate place to sleep; they may be sheltered or unsheltered. After meeting safety needs, the nurse can focus on love and belonging, self-esteem, or self-actualization.

. **b.** Healthy People 2020 defines health disparity as a "particular type of health difference that is closely linked with social, economic, and/or environmental disadvantage." Disparities are influenced by race and ethnicity, poverty, sex assigned at birth, age, mental health, educational level, disabilities, sexual orientation, health insurance, and access to health care.

. **b, c.** Tertiary health promotion and disease prevention begins after an illness is diagnosed and treated to reduce disability and to help rehabilitate patients to a maximum level of functioning. Tertiary interventions include providing ROM exercises and patient teaching for residual limb care. Providing immunizations and teaching parents how to childproof their homes and use an appropriate car seat are primary health promotion activities. Providing screenings is a secondary health promotion activity.

. **d.** Exacerbation of a chronic illness occurs when the symptoms of a disease reappear after having been absent for a time.

. **d.** Both these models view health as a dynamic (constantly changing state).

. **a.** Morbidity refers to how frequently a disease occurs; mortality is the number of deaths resulting from a disease. These statistics may be placed in tables as a reference for others.

Health of the Individual, Family, Community, and Environment

Rolanda Simpkins

Rolanda, a 16-year-old adolescent who is sexually active, comes to the clinic seeking information about contraception. She states, “My mother would ‘kill me’ if she knew I was asking about this.”

Samuel Kaplan

Samuel is the 80-year-old husband of a 76-year-old woman who was diagnosed with Alzheimer disease 1 year ago. Visibly tearful, he states, “I don’t think that I can continue to care for my wife at home anymore. But how can I even consider putting her in a nursing home?”

Carlotta Rios

Carlotta is a 17-year-old girl who was brought to the mental health–psychiatric unit because of attempted suicide. She is not fluent in English and lives with her sister because of the recent death of her mother.

Carlotta expresses a desire to “disappear” and not return to her sister’s home. Further assessment reveals possible verbal abuse by her sister.

Learning Outcomes

After completing the chapter, you will be able to accomplish the following:

. Describe each level of Maslow’s hierarchy of basic human needs.
. Explain nursing care necessary to meet needs in each level of Maslow’s hierarchy.
. Discuss family concepts, including family roles, structures, functions, developmental stages, tasks, and health risk factors.
. Identify aspects of the community that affect individual and family health.
. Describe nursing interventions to promote and maintain health of the individual as a member of a family and as a member of a community.
. Explain why every nurse should be committed to environmental health, building a culture of health, and promoting the United Nations Sustainable Development Goals.

Nursing Concepts

Health, wellness, and illness
Family

Key Terms

basic human needs
blended family
climate change/crisis
community
environmental health
extended family
family
love and belonging needs
nuclear family
physiologic needs
safety and security needs
self-actualization needs
self-esteem needs

Humans are complex organisms, influenced by and responsive to both internal and external environments. Our behaviors, feelings about ourselves and others, values, and the priorities we set for ourselves all relate to our physiologic and psychosocial needs. These needs are common to all people, and meeting these needs is essential for the health and survival of all people; therefore, they are called **basic human needs**. Basic human needs can be met or unmet in a variety of ways. A person can meet some needs independently, but most needs require relationships and interactions with others for partial or complete fulfillment. Satisfying one’s needs often depends on the physical and social environment, especially one’s family and community.

Holistic nursing care, which is based on considering all human dimensions affecting how the patient’s basic human needs are met in health and in illness, allows the nurse to provide thoughtful, person-centered, health-oriented care. This chapter discusses how basic human needs, the family, the community, and the environment affect the health of every individual. (For an example, see the accompanying Reflective Practice box.)

Concept Mastery Alert

A holistic framework of care involves not just the individual patient but all those around the patient, most importantly the family and their active participation in promoting health.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

THE INDIVIDUAL

In nursing, we consider the physical, safety, psychosocial, and spiritual needs of each individual patient. Abraham Maslow (1968) developed a hierarchy of basic human needs that describes which needs of a person are the most important at any given time (Fig. 4-1). Certain needs are more basic or essential than others and must be at least minimally met before other needs can be considered.

Maslow's hierarchy is useful for understanding relationships among basic human needs and for establishing priorities of care. The hierarchy is based on the theory that something is a basic need if it has the following characteristics:

- Its lack of fulfillment results in illness.
- Its fulfillment helps prevent illness or signals health.
- Meeting it restores health.
- It takes priority over other desires and needs when unmet.
- The person feels something is missing when the need is unmet.
- The person feels satisfaction when the need is met.

Nursing care is often directed toward meeting unmet or threatened needs. Maslow's hierarchy provides a framework for nursing assessment and for understanding the needs of patients at all levels, so that interventions to meet priority needs become a part of the care plan. Many nursing interventions are aimed at meeting patients' basic human needs. The following sections describe each level of need in more detail.

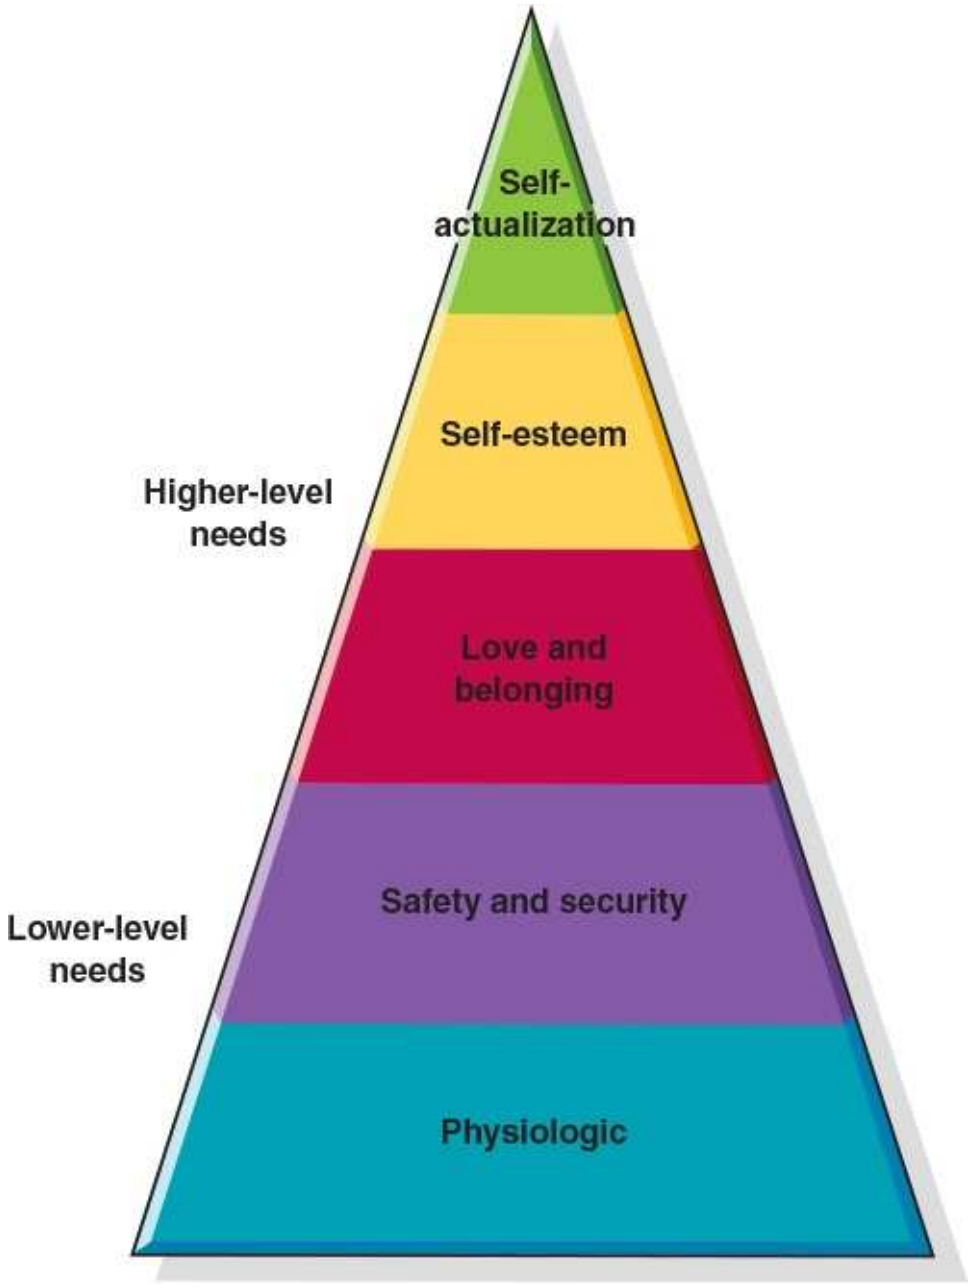

FIGURE 4-1. Maslow's hierarchy of basic human needs.

QSEN Reflective Practice: Cultivating QSEN Competencies

CHALLENGE TO ETHICAL AND LEGAL SKILLS

Junior year was full of excitement and new experiences. I was both nervous and excited about our mental health clinical rotation. Although the staff was very helpful and cooperative to provide as great an experience as they could, I found this clinical rotation to be difficult. I was going to be speaking with patients who had mental health problems and developing nurse–patient relationships that were different from the ones that I'd had in the past. To tell the truth, I was fearful. I was afraid I would say the wrong thing, causing the person to react, possibly injuring himself or others.

One patient really made an impression on me—Carlotta Rios, a 17-year-old girl who was brought to the

unit because of attempted suicide. Her first language was Spanish and she was not fluent in English, and she lived with her sister because her mother had recently passed away. The nurses asked me to speak with her because I spoke Spanish.

When talking with her, I found out that Carlotta did not like living with her sister because the sister verbally abused her, always putting her down and constantly reminding Carlotta that the only reason she was here was because of her sister. Carlotta reported that her sister constantly told her about all of the sacrifices that she was making just so that Carlotta could be with her. According to Carlotta, her sister said that Carlotta did not appreciate everything that her sister was doing. The sister constantly reminded Carlotta of everything she bought for her, keeping a record so that Carlotta would pay her back. Carlotta said that she was not happy and figured that the only way she would stop feeling bad and that her sister would be happy again would be if Carlotta disappeared. Carlotta no longer wanted to exist.

Talking with Carlotta further, I found out that she did not want to return to her sister's home. Unfortunately, this was a problem because legally she was not considered an adult. Therefore, Carlotta's sister would have to be contacted. Yet, it seemed that Carlotta's current family and living situation was not the safest. It also seemed to be the cause of Carlotta's desperate attempt to take her life. If she chose not to return to her sister's house, Carlotta would be taken to court in handcuffs and placed in a foster home. Although this placement would only be until she turned 18 years old, which was at the end of the month, it also meant that once she was 18 years old, she would be on her own. It was apparent that she was not ready for such a drastic change.

Thinking Outside the Box: Possible Courses of Action

- Call Carlotta's sister and have her pick Carlotta up, because she is legally responsible for the patient.
- Gain the trust of the patient by speaking to her as an adult and informing her of all the options, ultimately assisting her with carrying them out.
- Call someone with whom she felt comfortable to provide support and also to hear the options available; in this way, the patient would have the opinion of someone she knew and trusted before she made a decision on which course of action to take.

Evaluating a Good Outcome: How Do I Define Success?

- Patient's safety is ensured.
- Patient benefits from the course of action decided on.
- The patient's human dignity is respected.
- No violations of the American Nurses Association's Code of Ethics occur.
- Patient makes the most appropriate decision, resulting in the best outcome for her.
- My ethical and legal obligations and those of the hospital are met.

Personal Learning: Here's to the Future!

I figured the best way to approach this situation was to develop a trusting relationship. So, after getting Carlotta up, we went to a brighter, better-lit room, where we had breakfast. I started by asking simple questions, eventually progressing to those that pertained to why she was in the hospital. Throughout our talks, I reinforced that her sister was considered the person legally responsible for Carlotta, explaining that if Carlotta decided not to call home, she would be taken in handcuffs to court and then would be placed in a foster home. I told her that this would only be until she turned 18 years old; upon turning 18, she then would be on her own. After listening to all of her options, she decided that she would call her sister to let her know where she was. She also told her sister that she would be staying with a best friend until she had figured things out. For Carlotta, this was the best decision to make because she felt safest. As a result of informing her sister, Carlotta would not have to go to court. Subsequently, any upset or disruption for her sister would be minimized, further adding to Carlotta's feelings of being safe. The priority for Carlotta was a safe environment. We were able to establish a trusting relationship and work together toward this end.

Stephanie Cuellar, Georgetown University

QSEN SELF-REFLECTION ON QUALITY AND SAFETY COMPETENCIES DEVELOPING KNOWLEDGE, SKILLS, AND ATTITUDES FOR CONTINUOUS IMPROVEMENT

How do you think you would respond in a similar situation? Why? What does this tell you about yourself and about the adequacy of your skills for professional practice? Can you think of other ways to respond? What *knowledge, skills,* and *attitudes* do you need to develop to continuously improve quality and safety when caring for patients like Carlotta?

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Patient-Centered Care: What additional information would be important for the nursing student to obtain from Carlotta to provide a more complete picture of the family situation? What family risk factors were evident here? Have these factors been addressed? What is the best way to communicate emotional support to Carlotta?

Teamwork and Collaboration/Quality Improvement: What communication skills do you need to continue to function as a resource and advocate for Carlotta? Would collaboration with your instructor or her nurse have resulted in additional alternatives or another approach with Carlotta? Are there community resources that might prove helpful to Carlotta? Do you think some form of family therapy might prove helpful to Carlotta and her sister?

Safety/Evidence-Based Practice: Is there anything more you could have done to acknowledge that you understood Carlotta's concern about the future? How do you think your response contributed to a safe environment for Carlotta? What evidence in nursing literature provides guidance for decision making regarding ensuring a safe environment and giving Carlotta the support that she needs?

Informatics: Can you identify essential information that must be documented in Carlotta's electronic record regarding communication that you had with her? Is it important to document your assessment of Carlotta's current mental status? Can you identify any additional information that supports safe patient care and coordination of care?

Physiologic Needs

Physiologic needs—for oxygen, water, food, elimination, temperature, sexuality, physical activity, and rest—must be met at least minimally to maintain life. These needs are the most basic in the hierarchy of needs and the most essential to life, and therefore have the highest priority. Most healthy children and adults meet their physiologic needs through self-care, but meeting physiologic needs is often a major part of the nursing care plan for young, old, disabled, and ill people who require assistance in meeting them.

Oxygen is the most essential of all needs because all body cells require oxygen for survival. Oxygenation of body cells is carried out primarily by the respiratory and cardiovascular systems; any alteration in the structure or function of these systems can result in an increased need for oxygen. This need may be acute (such as when cardiopulmonary resuscitation is needed) or chronic (requiring special positioning, treatments, and teaching). Nurses evaluate patients' oxygen needs by assessing skin color, vital signs, anxiety levels, responses to activity, restlessness, and mental responsiveness.

A balance between the intake and elimination of fluids is also essential to life. Healthy people drink fluids to satisfy thirst, and they maintain fluid balance through various physiologic processes. Disruption in the water balance of the body results in either dehydration or edema (the collection of fluid in body tissues). Dehydration results from conditions such as severe diarrhea or vomiting, whereas edema is caused by diseases of the cardiovascular or renal system, trauma, and other factors. Measuring intake and output, testing the resiliency of the skin, checking the condition of the skin and mucous membranes, and weighing the patient help assess a patient's water balance.

Food and elimination are related physiologic needs, with a balance maintained through digestive and metabolic processes. The need for food is manifested through hunger. Insufficient nutrient intake results in nutrient and electrolyte imbalances and weight loss. Waste products are eliminated from the body through the skin, lungs, kidneys, and intestines. A patient's nutritional status is assessed with a variety of indicators, including weight, muscle mass, strength, and laboratory values.

The human body functions best within a narrow temperature range, usually considered as plus or minus 98.6°F (37°C). Homeostatic mechanisms and adaptive responses, such as sweating or shivering, help maintain this temperature. Nurses assess body temperature as a vital sign (see Chapter 26).

Sexuality is an integral component of each person and may be affected by physical and emotional illnesses. Sexual practices depend on a variety of factors, such as a person's age, sociocultural background, self-esteem, and level of health. Health care providers are increasingly aware that consideration of sexuality is a vital part of holistic care.

Recall **Rolanda Simpkins**, the 16-year-old girl described at the beginning of the chapter requesting information about contraception. The nurse can use knowledge about Rolanda's sexuality and sexual practices to help determine the most appropriate method of contraception for her.

Physical activity and rest are also basic physiologic needs. Physical activity depends on intact and functioning neuromuscular and skeletal systems. Rest and sleep allow time for the body to rejuvenate and be free of stress. Individual requirements for rest and sleep vary widely, but the adverse health effects of deprivation have been well documented. Factors that influence sleep include age, environment, exercise, stress, and drug use.

Think back to **Samuel Kaplan**, the 80-year-old man caring for his wife with Alzheimer disease at home. The nurse assesses the effect of providing this care on Mr. Kaplan's activity, rest, and sleep patterns, thereby developing an appropriate care plan for him to ensure that his needs are met as well.

Safety and Security Needs

Safety and security needs come next in priority after physiologic needs, and have both physical and emotional components. Physical safety and security means being protected from potential or actual harm. Nurses carry out a wide variety of activities to meet patients' physical safety needs, such as the following:

- Using proper hand hygiene and sterile techniques to prevent infection
- Using electrical equipment properly
- Administering medications knowledgeably
- Skillfully moving and ambulating patients
- Teaching parents about household chemicals that are dangerous to children

Specific safety interventions are discussed in Chapter 28.

Emotional safety and security involves trusting others and being free of fear, anxiety, and apprehension. Patients entering the health care system often fear the unknown and may have significant emotional security needs. Nurses can help meet such needs by encouraging spiritual practices that provide strength and support, by allowing as much independent decision making and control as possible, and by carefully explaining new and unfamiliar procedures and treatments.

Remember **Carlotta Rios**, the adolescent described in the Reflective Practice display. The nurse fosters the development of a trusting relationship to promote emotional safety and security. Doing so assists Carlotta in her decision-making process about going home.

Love and Belonging Needs

All humans have a basic need for love and belonging. After physiologic and safety and security needs, this is the next priority, and is often called a higher-level need. **Love and belonging needs** include the understanding and acceptance of others in both giving and receiving love, and the feeling of belonging to groups such as families, peers, friends, a neighborhood, and a community.

People who believe that their love and belonging needs are unmet often feel lonely and isolated. They may withdraw

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

physically and emotionally, or they may become overly demanding and critical. Often, these behaviors signal that the person has unmet love and belonging needs. Nurses should always consider love and belonging needs (Fig. 4-2) when developing a care plan, including nursing interventions such as:

- Including family and friends in the care of the patient
- Establishing a nurse–patient relationship based on mutual understanding and trust (by demonstrating care, encouraging communication, and respecting privacy)
- Referring patients to specific support groups (such as a cancer support group or Alcoholics Anonymous)

FIGURE 4-2. By providing time for the mother and newborn to bond, the nurse is helping to fulfill the need for love and belonging of both mother and child.

Think back to **Samuel Kaplan**, the man caring for his wife with Alzheimer disease. The nurse could refer Mr. Kaplan to a support group for caregivers of people with Alzheimer disease to help meet Mr. Kaplan's needs for love and belonging.

Self-Esteem Needs

The next highest priority on the hierarchy is **self-esteem needs**, which include the need for a person to feel good about themselves, to feel pride and a sense of accomplishment, and to believe that others also respect and appreciate those accomplishments. Positive self-esteem facilitates the person's confidence and independence.

Many factors affect self-esteem. When a person's role changes (e.g., through illness or the death of a spouse), self-esteem can be seriously altered because the person's responsibilities and relationships also change. A change in body image, such as the loss of a breast, an injury, or a growth spurt during puberty, may also affect self-esteem. Nurses must remember that the person's perception of the change—rather than the actual change itself—is what affects that person's self-esteem. Nurses can help meet patients' self-esteem needs by respecting their values and beliefs, encouraging patients to set attainable goals, and facilitating support from family, friends, or significant others. These actions promote a sense of worth and self-acceptance.

Self-Actualization Needs

The highest level on the hierarchy of needs is **self-actualization needs**, which include the need for people to reach their full potential through development of their unique capabilities. In general, each lower level of need must be met to some degree before this need can be satisfied. The process of self-actualization continues throughout life. Maslow lists the following qualities that indicate achievement of individual potential:

- Acceptance of self and others as they are
- Focus of interest on problems outside oneself
- Ability to be objective
- Feelings of happiness and affection for others
- Respect for all people
- Ability to discriminate between good and evil

- Creativity as a guideline for solving problems and pursuing interests

To help meet patients' self-actualization needs, the nurse focuses on the person's strengths and possibilities rather than on problems. The following is an example of a nurse assisting a patient to meet self-actualization needs:

> During a clinic visit, a patient with diabetes expresses difficulty with his prescribed dietary recommendations, but also recognizes that he needs to be more careful or "I'll end up losing a leg or having trouble seeing because of this disease." A nurse coach recognizes that the patient is the best expert about his own health, and listens carefully as he reviews his eating habits and discusses what he thinks he needs to do differently. Based on assessment data and the patient's desire to change his behavior, the nurse and patient together create an action plan to begin the process of change and move toward the optimal way for him to achieve his goals.

Nursing interventions are aimed at providing a sense of direction and hope and providing teaching that is aimed at maximizing potentials.

Recall **Carlotta Rios**, the 17-year-old who had attempted suicide. By focusing on her strengths as well as helping her explore alternatives to her current lifestyle, the nurse helps to meet Carlotta's self-actualization needs by fostering personal growth and assisting her to find meaning to her life.

Applying Maslow's Theory

Nurses can apply Maslow's hierarchy of basic needs in the assessing, diagnosing, planning, implementation, and evaluation phases of patient care. The hierarchy can be used with patients at any age, in all settings where care is provided, and in both health and illness. It helps the nurse identify unmet needs as they become health care needs. The hierarchy of basic needs allows the nurse to locate the patient on the health–illness continuum and to incorporate the human dimensions and health models into meeting needs (Table 4-1).

As the nurse identifies and carries out interventions to help meet patients' needs, it is important to remember that Maslow's hierarchy is only a framework or guideline, and that, in actuality, each person sets their own priorities for needs. In addition, basic human needs are interrelated, and may require nursing actions at more than one level at a given time. For example, in caring for a person coming into the emergency department with a heart attack, the nurse's immediate concern is the patient's physiologic needs (e.g., oxygen and pain relief). At the same time, safety needs (e.g., for oxygen use precautions and for ensuring that the person does not fall off the examining table) and love and belonging needs (e.g., for having a family member nearby if possible) are still major considerations. You will learn how nurses meet basic human needs throughout the rest of this book.

Table 4-1 The Human Dimensions and Basic Human Needs

	BASIC HUMAN NEED	EXAMPLES
Physical dimension	Physiologic needs	Breathing Circulation Temperature Intake of food and fluids Elimination of wastes Movement
Environmental dimension	Safety and security needs	Housing Community/neighborhood Climate
Sociocultural dimension	Love and belonging needs	Relationships with others

		Communications with others Support systems Being part of a community Feeling loved by others
Emotional dimension	Self-esteem needs	Fear Sadness Loneliness Happiness Accepting self
Intellectual and spiritual dimensions	Self-actualization needs	Thinking Learning Decision making Values Beliefs Fulfillment Helping others

THE FAMILY

Almost every person is a member of a number of groups, such as family, friends, professional colleagues, a church congregation, or a school class. Each of these groups involves a specific part of the person's life and is important to the person. However, only one group—the family—is typically concerned with all parts of a person's life and with meeting the individual's basic human needs to promote health.

A **family** can be defined simply as any group of people who live together and depend on one another for physical, emotional, and financial support. Families are essential to the health and survival of the individual family members, as well as to society as a whole. The family is a buffer between the needs of the individual member and the demands and expectations of society. The role of the family is to help meet the basic human needs of its members while also meeting the needs of society (Pender et al., 2019).

Family Structures

A family may consist of two or more people who may be related or unrelated either biologically or legally; members may be of the same assigned sex or different assigned sex, and members may be of the same or various generations. A family may include unmarried people with a meaningful commitment to each other (Pender et al., 2019). Nurses must remember that there are no absolute "rights" or "wrongs" about what makes a family, and one person's values must not be imposed on another person. Respect for all kinds of family members and relationships is essential to person-centered, individualized patient care.

Nuclear Family

The **nuclear family**, also called the traditional family, is composed of two parents and their children. Contemporary descriptions of a nuclear family vary. Pender et al. (2019) define a nuclear family as "two or more persons who depend on one another for emotional, physical, or financial support."

There is great variability in nuclear family structure in today's "postmodern families." The parents may be of any sexual orientation and are usually either married or in a committed relationship; family members live together until the children leave home as young adults. The nuclear family may be composed of biologic parents and children, adoptive parents and children, surrogate parents and children, or step-parents and children. Multiple research studies have concluded that family processes, such as the quality of parenting and harmony between parents, rather than family structures, contribute to a child's well-being (American Academy of Pediatrics).

In the past, the traditional nuclear family typically consisted of a breadwinner husband and caregiver wife. In contemporary nuclear families, both parents may work for pay while sharing roles in providing physical and emotional safety and security. The two major causes of this change are increased education and career opportunities for women, and changes in our economy resulting in a need for additional income to maintain a desired standard of living. The contemporary nuclear family often lives in close geographic proximity to relatives, such as aunts, uncles, and grandparents, who are a part of the **extended family**. Couples without children and couples with grown children who no longer live at home are considered nuclear families as well. The **blended family** is another form of a nuclear family, formed when parents bring unrelated children from previous relationships together to form a new family.

Single-Parent Family

For decades, the share of U.S. children living with a single parent has been rising, accompanied by a decline in marriage rates and a rise in births outside of marriage. A new Pew Research Center study of 130 countries and territories shows

that the United States has the world's highest rate of children living in single-parent households (Kramer, 2019).

Many single-parent families are headed by women. Single parents often have special problems and needs, including financial concerns and role shifts (i.e., having the roles of both parents), and they may remarry or enter into new relationships. The situation and needs of the single-parent family are important considerations when planning and implementing nursing care.

Other Family Structures

In addition to traditional and single-parent families, cohabiting adults and single adults are other family structures. Cohabiting families are people who choose to live together for a variety of reasons, including relationships, financial need, or changing values. Cohabiting families include unmarried adults living together (they may be of any age, including retired people who choose not to marry because it would impose financial hardship) and communal or group marriages. Other family structures include binuclear (where divorced parents assume joint custody of children) and dyadic nuclear (in which the couple chooses not to have children).

Single adults may not be living with others, but they are part of a family of origin, may have a social network with significant others, or may even regard a pet as family. Most single adults living alone are either young adults who achieve independence and enter the workforce or older adults who never married or are left alone after the death of a spouse.

With changes in family structure have come other influences on the basic human needs of family members. Considerations for the family, and for nursing care, include support systems (in our mobile society, family members may live hundreds or thousands of miles away), availability of childcare, time for leisure and recreation, struggles to meet financial commitments, and changing role models. During the COVID-19 pandemic, numerous family stressors taxed families, including the need for working parents to assume responsibility for their children's online learning and the need to socially distance to protect high-risk family members—which included grandparents no longer having visits from their children and grandchildren and some frontline nurses sleeping in hotels to avoid transmitting COVID-19 to a dependent family member. Not all was negative about the pandemic; this author's niece, an attorney with three children ages 7 and younger, wrote: "Yes, the pandemic has been a challenge. Huge challenge! But facing and overcoming challenges with dignity and grace is what life is all about! From a work/life balance, this has turned out to be a blessing to spend more quality time with the kids."

Family Functions

Families have important functions that affect how individual family members meet their basic human needs and maintain their health. The family provides the individual with an environment for development and social interactions. Families also are important to society as a whole because they provide new and socialized members for society.

Family functions occur in five major areas. Physically, the family provides a safe, comfortable environment necessary for growth, development, and rest or recuperation. Economically, the family provides financial aid to family members and also helps meet society's needs. The reproductive function of many families is to have and raise children. The affective and coping functions of the family provide emotional comfort to family members and help members establish their identity and maintain it in times of stress. Finally, through socialization, the family teaches; transmits beliefs, values, attitudes, and coping mechanisms; provides feedback; and guides problem solving (Friedman et al., 2003).

Developmental Tasks of Families

Duvall and Miller (1984) identified critical family developmental tasks and stages in a family life cycle. Duvall's theory, based on Erikson's theory of psychosocial development (described in Chapter 23), states that all families have certain basic tasks for survival and continuity, as well as specific tasks related to developmental stages throughout the life of the family. These stages and developmental tasks are outlined in Table 4-2. If the family does not meet certain developmental tasks, societal disapproval may lead to intervention by children's services, social services, police departments, welfare facilities, or health departments. The successful mastery of each developmental stage is important to the family's adaptation and growth through successive stages. See the accompanying Vulnerable Population Alert.

Table 4-2 Family Stages, Tasks, Health Risk Factors, and Nursing Interventions to Promote Health

Family Stage[a]	TASKS	STAGE-SPECIFIC RISK FACTORS	STAGE-SPECIFIC NURSING INTERVENTIONS/REFERRALS
Couple and family with young children	Establish a mutually satisfying marriage/relationship Plan to have or not to have children Have and adjust to infant	Inadequate knowledge of contraception and family planning Inadequate knowledge of sexual and marital roles	Family planning clinics Prenatal classes Well-child clinics Vision and hearing screenings Dental health information Parent support groups

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

	Support needs of all family members Adjust to cost of family life Adapt to needs and activity of children Cope with loss of energy and privacy Encourage and support growth and development and educational achievements	Lack of knowledge about child safety and health Child abuse and neglect First pregnancy before age 16	Safety in the home, daycare, school, neighborhood, and community
Family with adolescents and young adults	Maintain open communications Support moral and ethical family values Balance teenagers' freedom with responsibility Maintain supportive home base Strengthen marital relationships	Family of origin Family value of aggressiveness Inadequate problem-solving abilities Conflict between family members Physical or sexual abuse Sexually transmitted diseases	Accident prevention programs Sex education Mental health programs Screening for chronic illness
Family with middle-aged adults	Maintain ties with younger and older generations Prepare for retirement	Depression Exposure to environmental or work-related health risks, such as sunlight, asbestos, radiation, coal dust, and air or water pollution	Blood pressure screenings Screening for chronic illness
Family with older adults	Adjust to retirement Adjust to loss of spouse May move from family home	Increasing age with loss of physical function Chronic illness Depression Death of spouse	Screening for chronic illness Home safety information Retirement information Pharmacology information

[a]Family includes all forms: nuclear, extended, single-parent, etc.

Vulnerable Population Alert: Children During the Pandemic

How aware are you of all the ways children in the communities you serve are being affected by the pandemic? Talk with your classmates about how this knowledge might impact your ability to diagnose actual and potential health problems and needs and target your interventions to better health outcomes for children.

Households with children continue to be hit harder by the financial pressures caused by the COVID-19 pandemic, according to the latest results of the U.S. Census Bureau's experimental Household Pulse Survey. Nationally, 24.7 million adults in mortgaged or rented households reported a later or deferred housing payment in May, 2020. Children especially affected by the negative economic impacts of the pandemic are facing both living in households where the rent or mortgage payments were late and where there was not enough food (https://www.census.gov/library/stories/2020/06/the-risks-children-face-during-pandemic.html).

Lockdown measures intended to keep people safe from COVID-19 in the United States may have some school children in danger says Margo Lindauer, director of the Domestic Violence Institute at Northeastern.

Seven months into the pandemic, Lindauer worries that the closure of schools, along with the added stress of balancing work, child care, and distance learning, has led to a rise in child abuse. And it's little wonder: People have spent more time insides their homes, some have lost jobs, and some have contracted the virus. All of these factors together are causing a perfect storm of increased rates of violence and decreased reporting of child abuse. The detrimental impacts of isolation and potential exposure to abuse, neglect, and food insecurity in many instances is worse than figuring out safe ways to get kids, at least temporarily or periodically, back in the classroom. The longer the pandemic goes on, the worse it's going to get (https://news.northeastern.edu/2020/10/13/closed-schools-could-be-putting-children-at-risk-during-the-covid-19-pandemic/).

With many schools still closed during the pandemic, educators worry that students without access to technology and no way to access online instruction will fall behind. The digital divide disproportionately impacts students of color, according to an analysis from USAFacts, which shows that 37% of American Indian and Alaska Native children, 19% of Black children, and 17% of Hispanic children lack access to the internet compared to 12% of White and Asian children (https://www.usnews.com/news/education-news/articles/2020-04-01/schools-rush-to-get-students-internet-access-during-coronavirus-pandemic).

The Family in Health and Illness

People learn health care activities, health beliefs, and health values in the family. When patients enter the health care system, they bring their own personal behaviors and needs, but they also bring (in a sense) their family too.

Friedman and associates (2003) identified the importance of family-centered nursing care in four ways. First, the family is composed of interdependent members who affect one another. If some form of illness occurs in one member, all other members become involved in the illness. Second, because there is a strong relationship between the family and the health status of its members, the role of the family is essential in every level of nursing care. Third, the level of health of the family and in turn each of its members can be significantly improved through health promotion activities. Finally, illness of one family member may suggest the possibility of the same problem in other members. Through assessment and intervention, the nurse can assist in improving the health status of all family members.

Illness may precipitate a health crisis in a family. If an illness is relatively minor, such as a viral infection in a child, changes in family tasks may be minor and brief. But if a family member's injury or illness is serious, the roles and responsibilities, as well as functions, of other family members change. This is especially true if the illness is chronic and long term, results in disability, or decreases the person's time to live. Some families find it difficult to adapt to the stress of changes in financial, social, and caregiving resources, whereas other families experience renewed family closeness and stability. Regardless of how the family adapts, members of the family must constantly adjust roles and responsibilities to manage the needs of the ill family member and the family.

Remember **Mr. Kaplan**, the 80-year-old man caring for his wife with Alzheimer disease. Now the primary caregiver, Mr. Kaplan's role has changed. The disease and family role changes may affect the family's ability to function. The nurse would incorporate knowledge of this when developing the most appropriate plan for Mr. Kaplan and his wife.

Nursing interventions for a family in a health crisis include providing teaching that is honest, open, and respectful; using therapeutic communication skills; applying knowledge of family dynamics; and making referrals to community health care and financial resources to support realistic hope. In addition, it is important to involve family members in planning and implementing care. Review the content on caring for family caregivers in Chapter 3.

Family Risk Factors

Family patterns of behavior, the environment in which the family lives, and genetic factors can all place family members at risk for health problems. Nurses should assess these factors before developing nursing care plans. Typical questions in a family assessment include the following (Pender et al., 2019):

- What is the family's structure?
- What is the family's socioeconomic status?
- What are family members' cultural background and religious affiliation?
- Who cares for children if both parents work?

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

- What are the family's health practices (e.g., types of foods eaten, meal times, immunizations, bedtime, exercise)?
- How does the family define health?
- What habits are present in the family (e.g., do any family members smoke, drink to excess, or use drugs)?
- How does the family cope with stress?
- Is any family member the primary caregiver for another family member?
- Do close friends or family members live nearby and can they help if necessary?

These questions are extremely important to ask when assessing **Carlotta Rios**, the adolescent described in the Reflective Practice display; Rolanda Simpkins, the 16-year-old wanting contraceptive counseling; and Samuel Kaplan, the older adult caring for his ill wife at home. Each person's answers provide the nurse with valuable information to help determine the best way to meet their needs. For Rolanda, understanding more about her relationship with her mother will guide the education and counseling. For Carlotta, this includes information about viable options for her living arrangements, including physical and emotional safety. For Mr. Kaplan, this assessment provides information about available sources of help so that he can continue to care for his wife at home or, if necessary, to ease the transition and adjustment to moving his wife to a long-term care facility.

The health assessment for a family should also consider the risk factors for altered health described in Box 4-1.

Nursing Interventions to Promote Family Health

The nurse can help reduce risk factors with activities that promote health for all family members at any level of development. Recall that each person has their own definition of health, based in part on family beliefs and values about health and illness. The nurse assists both the person and the family to meet basic human needs. Examples of stage-specific risk factors and nursing interventions to promote health in the family are shown in Table 4-2 (on page 84). Nurses may carry out such activities themselves or may refer the individual or family to other health care providers. Health promotion activities and nursing actions can reduce the risk for illness and facilitate healthy behaviors at any age within the family life cycle.

Consider **Rolanda Simpkins**, the adolescent seeking contraceptive information. The nurse needs to evaluate further her statement that her mother would "kill her," questioning Rolanda further to determine the family's health beliefs and practices.

Box 4-1 **Risk Factors for Altered Family Health**

Lifestyle Risk Factors

- Lack of knowledge about sexual and marital roles, leading to teenage marriage and pregnancy; divorce; sexually transmitted infections; child, spouse, or elder abuse; and lack of prenatal or child care

- Alterations in nutrition—either more or less than body requirements at any age
- Chemical dependency, including the use of alcohol, drugs, and nicotine
- Inadequate dental care and hygiene
- Unsafe or unstimulating home environment

Psychosocial Risk Factors

- Inadequate childcare resources, when both parents work, for preschool and school-aged children
- Inadequate income to provide safe housing, food, clothing, and health care
- Conflict between family members

Environmental Risk Factors

- Lack of knowledge or finances to provide safe and clean living conditions
- Work or social pressures that cause stress
- Air, water, or food pollution

Developmental Risk Factors

- Families who have new babies, especially if support systems are unavailable
- Older adults, especially those living alone or on a fixed income
- Unmarried adolescent parents who lack personal, economic, and educational resources

Biologic Risk Factors

- Birth defects
- Intellectual disability
- Genetic predisposition to certain diseases, including cardiovascular diseases and cancer

THE COMMUNITY

A person, as an individual and as a member of a family, is also a member of a community. The most basic definition of a **community** is a specific population or group of people living in the same geographic area under similar regulations and having common values, interests, and needs. A community may be a small neighborhood within a city or a large rural area, including a small town. Communities are based on shared characteristics of people, the area, social interaction, and familial, cultural, or ethnic heritage and ties. Within a community, people interact and share resources. The community environment affects the ability of the person to meet basic human needs. This section discusses the relationship of the community to basic human needs, including influences on health and illness. Be sure to check out the content on social determinants of health in Chapter 3.

The physical and social environments of communities have been implicated by the Institute of Medicine (renamed the National Academy of Sciences, Engineering, and Medicine as of 2015) and the National Research Council as possible contributing factors to health disadvantages in the United States as compared to other high-income countries (Woolf & Aron, 2013). Americans die younger and have a consistent pattern of poor health and death and suffering from illness and injuries compared to the other wealthiest nations in the world. Designing healthier community environments is one of the recommended strategies to promote more favorable health outcomes in the United States. See Chapter 3 for additional explanations of and implications for this U.S. health disadvantage.

Many community factors affect the health of residents. A healthy community enables people to maintain a high quality of life and productivity. For example, a healthy community:

- offers access to health care services for all members of the community, which provide both treatment for illnesses and activities to promote health.
- has roads, schools, playgrounds, and other services to meet needs of the people in the community.
- maintains a safe and healthy environment.

The Robert Wood Johnson Foundation (n.d.) has identified healthy communities as one of its four focus areas. See the foundation's website (http://www.rwjf.org/en/our-focus-areas/focus-areas/healthy-communities.html) for examples of programs to build healthy communities. Similarly, the Division of Community Health (DCH) and Partnerships to Improve Community Health (PICH) support the implementation of evidence-based strategies to improve the health of communities and reduce the prevalence of chronic disease. The DCH focus areas are tobacco use and exposure, poor nutrition, physical inactivity and lack of access to opportunities for chronic disease prevention, risk reduction, and disease management.

The health of a community's residents is affected by the social support systems, the community health structure, environmental factors, and facilities providing assistance for those in need of shelter, housing, and food. Examples of community factors affecting health are listed in Box 4-2 and are discussed further in the following sections.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Box 4-2 Examples of Community Factors Affecting Health

- Number and availability of health care institutions and services
- Housing codes
- Police and fire departments
- Nutritional services for low-income infants, parents, school-aged children (e.g., lunch programs), and older adults
- Zoning regulations separating residential and industrial areas
- Waste disposal services and locations
- Air and water pollution
- Food sanitation
- Health education services and dissemination
- Employment opportunities
- Recreational opportunities
- Violent crimes or drug use

Social Support Systems

A person's social support systems are made up of all the people who help meet financial, personal, physical, and emotional needs. In most instances, family, friends, and neighbors provide the best social support within a community. To understand the social support systems of a community, it is important to know who provides support (such as family, neighbors, friends, church, and organizations).

Community Health Care Structure

The health care structure of a community directly affects the health of the people living within it. The size and location of the community often determine what services are available. For example, urban residents may have public transportation to a variety of health care providers, whereas rural residents may need to travel long distances on their own for care. County and state funding for community health care services also determines the type and number of available health care institutions and facilities.

Economic Resources

Personal finances and health care insurance coverage affect a person's access to health care services within a community. As private health insurance costs continue to escalate, fewer citizens have optimal insurance. Many part-time and service-industry jobs provide no insurance benefits at all, resulting in a substantial number of citizens without any financial assistance for health care screenings or care for illnesses.

Signed in March 2010, the Patient Protection and Affordable Care Act (PPACA), often referred to simply as the Affordable Care Act, aims to provide improved health security and access to health care for all Americans through comprehensive health insurance reforms being implemented in stages over several years. Major provisions of the act provide a right to coverage for Americans with preexisting conditions, allow young adults up to 26 years of age to continue to be covered under their parents' plan, and end lifetime limits on coverage. In addition, the act expands Medicaid coverage to millions of low-income Americans and makes numerous improvements to the Children's Health Insurance Program, or CHIP (Affordable Care Act, n.d.; HealthCare.gov). The PPACA has many more provisions to facilitate health insurance coverage and help care for underserved populations and eliminate disparities in health care. As this text goes to publication, efforts are underway to repeal the PPACA, which could result in many more citizens losing their insurance and access to basic health care services. Chapter 11 further discusses the costs of health care.

Effect on Individuals and Families

The community has a strong influence on health promotion and illness-prevention activities of individuals and families in the community (Fig. 4-3 on page 88). Just as there are family risk factors for the health of individual members, so are there community risk factors involving resources, economics, and services. For nursing assessments and interventions to be comprehensive and individualized, the nurse must consider the community's influence.

FIGURE 4-3. Many characteristics of a community influence the health of its members. This diagram shows six categories of characteristics that influence the health of a member of a community.

Consider the following examples of how the community can affect the individual's and family's needs:

Tara, 20 years old, lives in a two-room apartment with her 6-month-old daughter in a lower-income area of a major city. The apartment lacks adequate heat and plumbing. Tara has no family living nearby, and she and her husband are separated and no longer live together. Tara rarely leaves her apartment because she fears for her safety due to the neighborhood's high crime rate. She is on a public assistance program but has never taken her baby to a local clinic for checkups because of her concerns that the neighborhood is not safe.

Anne, 22 years old, lives in a small house in a rural area. Her 4-year-old son is in a community preschool program with afterschool care. She is a single mother and works as an assistant at an insurance facility. Anne often sees her family members, who live nearby. Anne and her son have regular health assessments.

These two different examples illustrate that the community plays a major role in the health of people who live there. Tara and her baby are at much greater risk for illness than are Anne and her son. Even if the two women had identical health care needs, their care plans would include different interventions because of their different community environments.

Nursing in the Community

In contrast to community health nursing, which focuses on whole populations within a community, community-based nursing is centered on the health care needs of individuals and families. Nurses practicing community-based nursing provide interventions to manage acute or chronic health problems, promote health, and facilitate self-care. Nursing care provided within a community must be culturally competent and family centered.

Concept Mastery Alert

Community health nursing focuses on whole populations; *community-based nursing* focuses on the members of the population, specifically the individuals and families within the population.

Nurses providing community-based care must know about the location and specialties of health care providers, the availability and accessibility of services and supplies, and other public health services. Additional considerations include facilities (such as daycare or long-term care), housing, and the number and type of facilities providing services.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

QSEN PATIENT-CENTERED CARE

QSEN urges nurses to understand how diverse cultural, ethnic, and social backgrounds function as sources of patient, family, and community values. Nurses working in the community are ideally positioned to collect data on traditions that affect different members of the community and to communicate patient values, preferences, and expressed needs to other members of the health care team.

The Future of Nursing, an Institute of Medicine report, emphasizes nursing as a vital component in all efforts to reform the health care system (Institute of Medicine, 2011; National Academies of Sciences, Engineering, and Medicine, 2021). The Affordable Care Act further reaffirms that nurse-managed centers in communities offer high-quality care to underserved populations in a cost-effective manner (Domrose, 2012). More than 250 nurse-managed health centers in the United States are improving health outcomes in communities because they understand community needs (Collins, 2012). Nurses in these centers carry out a variety of activities that focus on wellness and prevention, including immunizations, prenatal care, health education, and medication supervision. Nurses promote health as individuals, as caregivers within institutional settings, and as community-based health care providers. Nurses also provide community services as volunteers in health-related activities (e.g., screenings, educational programs, and blood drives) and as role models for health practices and lifestyles.

Nurses working in a variety of health care settings consider community influences when developing individualized nursing care plans and when making referrals to community facilities and support groups. Community-based nurses are employed in many different kinds of practice settings, including home care (Fig. 4-4), community health centers, school nursing, occupational nursing, and independent nursing practice. Community-based care is discussed in more detail in Chapter 12.

FIGURE 4-4. A nurse at work in a home health care setting. (*Source: Photo by Monkey Business Images/Shutterstock*.)

THE ENVIRONMENT

All nurses are to be aware of the principles of environmental health for nursing (American Nurses' Association, 2007). Provision 9.4 of the ANA Code of Ethics for Nurses with Interpretive Statement (2015) counsels that social justice extends beyond human health and well-being to the health and well-being of the natural world:

> Consistent with Florence Nightingale's historic concerns for environmental influences on health, … the profession's advocacy for social justice extends to ecojustice. Environmental degradation, aridification, earth resources exploitation, ecosystem destruction, waste, and other environmental assaults disproportionately affect the health of the poor and ultimately affect the health of all humanity. As nursing seeks to promote and restore health, prevent illness and injury, and alleviate pain and suffering, it does so within the holistic context of healing the world (p. 37).

See Box 4-3 for the top 10 reasons why nurses and environmental health go together. ANA's *Nursing: Scope and Standards of Practice* (2021) includes Standards 17, Resource Stewardship and 18, Environmental Health.

The community environment in which a person lives and works can have either helpful or harmful effects on health. **Environmental health** may be defined as that aspect of human health determined by physical, chemical, biologic, and psychosocial factors in the environment. Environmental barriers to accessing health care within a community may include lack of transportation, distance to services, and location of the services.

Box 4-3 Top 10 Reasons Why Nurses and Environmental Health Go Together

1. Nurses provide healing and safe environments for people.
2. Nurses are trusted sources of information.
3. Nurses are the largest health care occupation.
4. Nurses work with persons from a variety of cultures.
5. Nurses effect decisions in their own homes, work settings, and communities.
6. Nurses are good sources of information for policy makers.
7. Nurses translate scientific health literature to make it understandable.
8. Nurses with advanced degrees are engaged in research about the environment and health.
9. Health organizations recognize nurses' roles in environmental health.
10. Nursing education and standards of nursing practice require that nurses know how to reduce exposures to environmental health hazards.

Source: Reprinted with permission from Smith, C. M. (2016). Why nurses are involved with environmental health. In J. Leffers C. M. Smith, K. Huffling, R. McDermott-Levy, & B. Sattler (Eds.), *Environmental health in nursing, Alliance of nurses for healthy environments* (pp. 2–5).

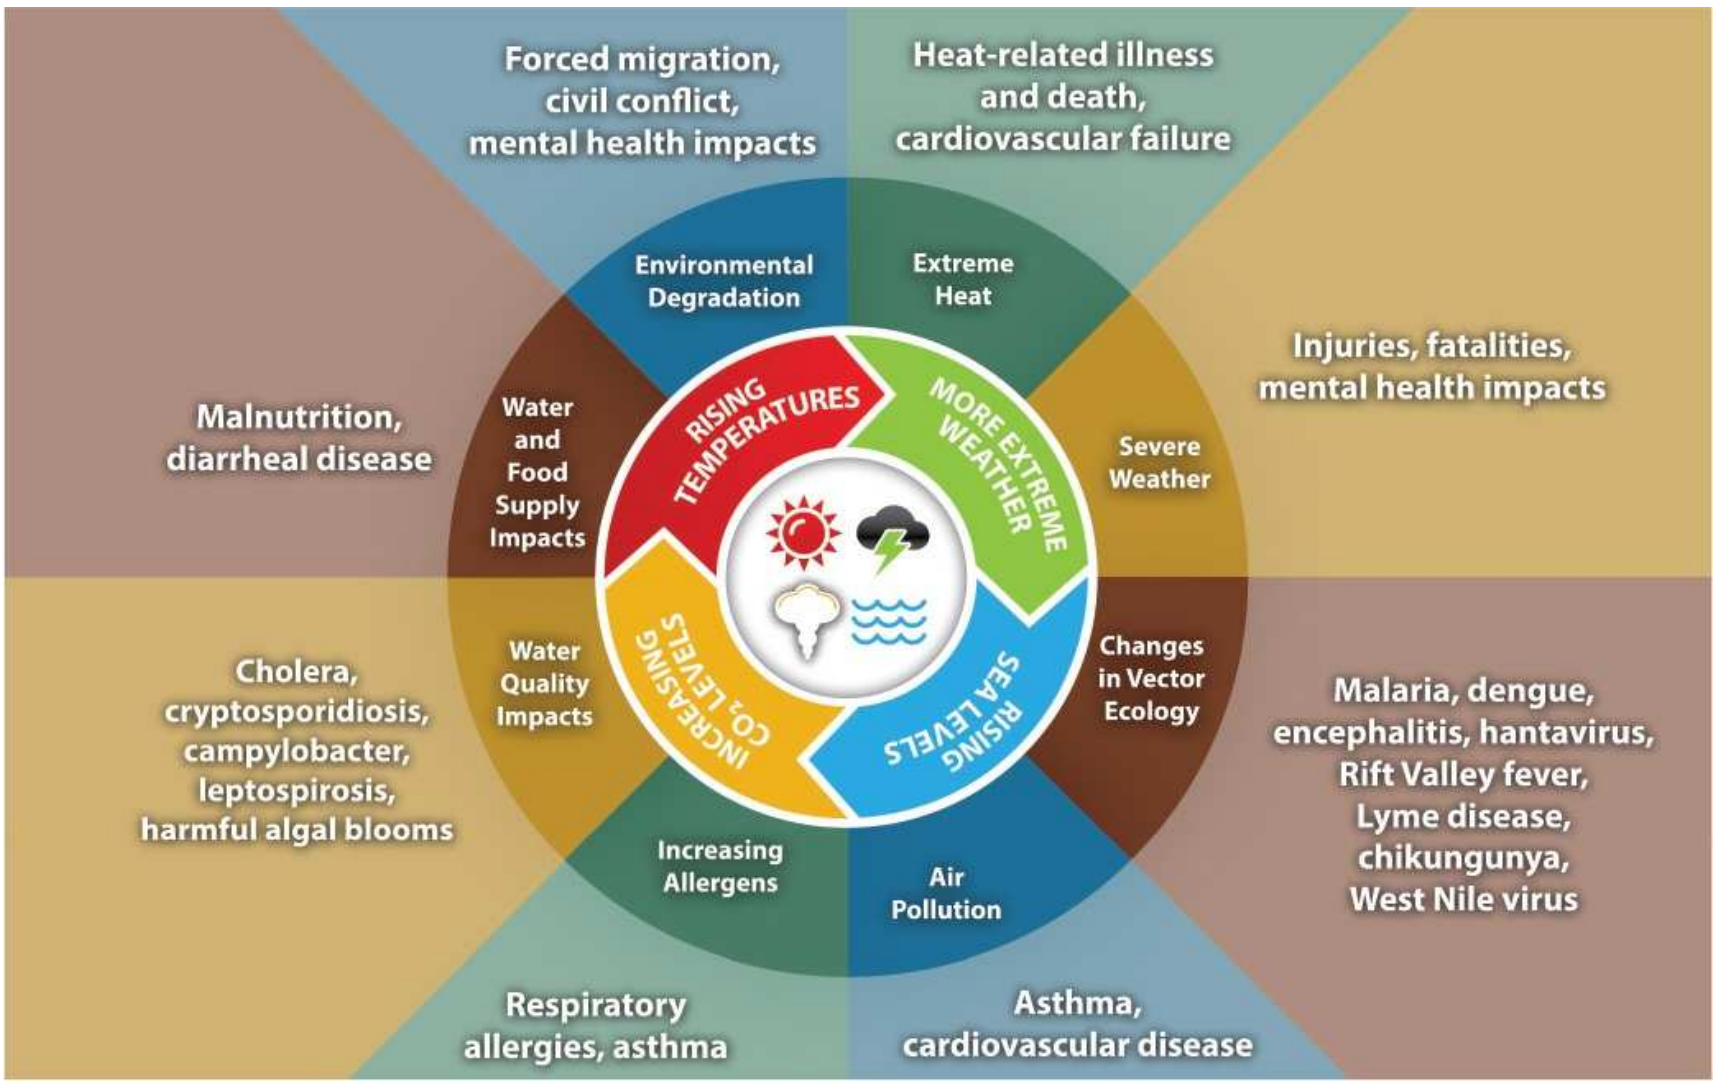

FIGURE 4-5. Impact of climate change on human health. (*Source:* Used with permission from Centers for Disease Control and Prevention. Climate effects on health. https://www.cdc.gov/climateandhealth/effects/default.htm.)

The quality of air and water differs across communities. Large urban areas are often affected by air pollution, whereas many smaller communities are at risk for water pollution from run-off of chemical or livestock wastes. Aging infrastructure also exacerbates these challenges. Read about the water crisis in Flint Michigan and its long-term effects. There is also increasing concern about how global warming and a growing potential for natural disasters affect health. As this chapter is being written, fires are raging in California, Oregon, and Colorado, and parts of Louisiana and Texas are suffering the devastating effects of hurricanes. The United Nations reports that no corner of the globe is immune from the devastating consequences of **climate change/crisis**:

> Rising temperatures are fueling environmental degradation, natural disasters, weather extremes, food and water insecurity, economic disruption, conflict and terrorism. Sea levels are rising, the Artic is melting, coral reefs are dying, oceans are acidifying, and forests are burning. It is clear that business as usual is not enough. As the finite costs of climate change reaches irreversible highs, now is the time for bold collective action (https://www.un.org/en/un75/climate-crisis-race-we-can-win).

See Figure 4-5 for an illustration of the impact of climate change on human health.

Climate Actions

ACT NOW is the United Nations campaign for individual action on climate change and sustainability. ACT NOW issued a call with particular urgency for nurses:

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Every one of us can help limit global warming and take care of our planet. By changing our habits and making choices that have less harmful effect on the environment, we have the power to confront the climate challenge and build a more sustainable world. Our lives depend on a healthy planet. Let's seize the moment and change course—toward more sustainable lifestyles.

How many of the 10 simple climate actions they recommend do you already practice?

. Take a 5-minute shower
. Use a reusable coffee mug
. Eat a plant-based meal
. BYOB—bring your own bag
. Turn off your lights when leaving the room
. Recycle your plastic waste
. Drive less
. Try zero-waste fashion
. Unplug your appliances
. Buy local

FIGURE 4-6. The United Nations Sustainable Development Goals. (*Source:* Reprinted with permission from the United Nations Sustainable Development Goals. https://www.un.org/sustainabledevelopment/student-resources/.)

Check the ACT NOW website and download their app to measure your impact at actnow.aworld.org. Your class may want to download their poster to educate your classmates.

Reducing Waste in Clinical Settings

Read the article in your bibliography about reducing waste in the clinical setting and be sure to assess what is happening in your practice sites (Saber, 2020; Wohlford et al., 2020). How committed are the frontline caregivers you observe to improving environmental sustainability and to realizing cost savings? Be sure to check out the Alliance of Nurses for Healthy Environments (https://envirn.org/) and Sustainable Solutions for Health Care (https://www.practicegreenhealth.org/). Would you use the label "environmentally 'woke' nurse" to describe yourself?

SUSTAINABLE DEVELOPMENT GOALS

"Since the inception of modern nursing, our leaders have continuously recognized social and environmental determinants as substantive forces in creating and sustaining health…. The [United Nations] Sustainable Development Goals represent an inspired transnational humanitarian agenda" (Rosa & Hasmiller, 2020, p. 69). See Figure 4-6. Rosa and Hasmiller offer a distinctive invitation for the nursing profession to innovate, collaborate, and lead in making improvements toward collective health and well-being while capitalizing on the gains of the past century. After carefully reviewing the 17 Sustainable Development Goals and the Robert Wood Johnson Foundation's principles to build a culture of health in Box 4-4, talk with your classmates about a class project you can do locally to achieve one of the goals that will link your project to global health efforts and contribute to the legacy of our profession. You may want to check out Sustainable Solutions for Health Care (https://www.practicegreenhealth.org/).

We know the contributions Florence Nightingale and other nurse leaders made to global health. What will your

contributions be?

Box 4-4 10 Principles for a Culture of Health

1. Good health flourishes across geographic, demographic, and social sectors.
2. Attaining the best health possible is valued by our entire society.
3. Individuals and families have the means and the opportunity to make choices that lead to the healthiest lives possible.
4. Business, government, individuals, and organizations work together to build healthy communities and lifestyles.
5. No one is excluded.
6. Everyone has access to affordable, quality health care because it is essential to maintain, or reclaim, health.
7. Health care is efficient and equitable.
8. The economy is less burdened by excessive and unwarranted health care spending.
9. Keeping everyone as healthy as possible guides public and private decision making.
10. Americans understand that we are all in this together.

Source: Used with permission, Robert Wood Johnson Foundation. (2019). *Building a culture of health: How we got here*. https://www.rwjf.org/en/cultureofhealth/about/how-we-got-here.html.

DEVELOPING CLINICAL REASONING AND CLINICAL JUDGMENT

. What do you believe to be the most important basic human need that is actually or potentially unmet in the following situations? How will this affect your assessment and diagnosis of actual or potential health problems and needs?

- A toddler falls into a swimming pool.
- An older woman falls at home and is not found for 3 days.
- A preschooler is admitted to the hospital with multiple bruises and burn marks.
- A teenager is constantly told "you are no good" by his parents.
- A long-term care facility resident says, "I never did anything right in my life."

. Our own family experiences often affect the way we relate to the families of our patients. Describe at least two possible responses to the families described below.

- Suspecting child abuse, a nurse asks a mother about her child's bruises. The woman says, "In our family, we believe in 'spare the rod and spoil the child.' "
- A single woman wants to have a child and comes to a fertility clinic for information on artificial insemination.
- Several members of a patient's large extended family are in the patient's long-term care facility room and are trying to do everything for the patient.

. If a natural disaster were to strike your town (e.g., tornado, earthquake, flood, fire), leaving many homeless, what priorities would guide your rescue efforts? What needs should take priority, and how could these best be met?

. Use the Pender, Murdaugh, and Parsons questions in the text to facilitate assessing a family's risk factors for health problems. Ideally, you will assess families in two or more sections of your town or city. How do you explain the differences you discover? How will you use these to plan care for these families?

. Reading your local newspaper, you learn that local rivers and creeks are not infrequently full of raw sewage, given the high-intensity rain storms affecting your neighborhood. What is surprising is that few seem to know this, and on any given day, you are likely to see numerous people jogging, biking, fishing, and walking kids and dogs along the waterways, not to mention boating, kayaking, and paddleboarding within them. You read that while volunteers have found dangerous levels of *Escherichia coli* in local waterways, the city has no plans for formal testing or notifying the public. How might you work to address this challenge as a proponent for environmental health?

PRACTICING FOR NCLEX

. Nurses in a long-term care facility use Maslow's hierarchy of basic human needs to plan care for their patients. What is the expected outcome when using this hierarchy?

a. Accurate nursing diagnoses
b. Clear priorities of care
c. Concerns communicated concisely
d. Integration of science into nursing care

. A nurse is prioritizing nursing care for patients on a medical-surgical unit. Which nursing interventions address patients' physiologic needs? Select all that apply.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

a. Preventing falls during admission
b. Administering oxygen to a patient with shortness of breath
c. Providing a magazine for a patient without visitors
d. Assisting a patient who had a stroke eat their dinner
e. Facilitating a visit from the patient's significant other
f. Referring a patient to a cancer support group

. A nurse provides care for postoperative patients using meticulous hand hygiene and aseptic technique. Which of Maslow's basic human needs is the nurse addressing?

a. Physiologic
b. Safety and security
c. Self-esteem
d. Love and belonging

. A nurse caring for patients in a long-term care facility develops strategies to help patients achieve Maslow's highest level of needs: self-actualization. Which concepts will the nurse incorporate when planning care? Select all that apply.

a. Humans are born with a fully developed sense of self-actualization.
b. Self-actualization needs are met by depending on family, friends, and others for help.
c. No matter the patient's age, the self-actualization process continues throughout life.
d. Loneliness and isolation occur when self-actualization needs are unmet.
e. A person achieves self-actualization by focusing on problems outside self.
f. Self-actualization needs may be met by creatively solving problems.

. A nurse in a family-centered health clinic is assessing a new family composed of two parents and three preschool children. Which value does the nurse include in a family-centered approach to health care?

a. Each person in the family will be evaluated and treated independently of the others.
b. Time will be saved as there is only one clinic to contact for health problems.
c. All members of the family can be part of health-related decisions.
d. Interdependence of family members affects them in illness and health.

. A nurse performs an assessment of a family consisting of a single parent, a grandparent, and two children. What interview questions will the nurse direct toward the mother to best determine the family's affective and coping functions? Select all that apply.

a. Who is the person you depend on for emotional support?
b. Who is the person you depend on for financial support in your family?
c. Do you plan on having any more children?
d. Who keeps your family together in times of stress?
e. What family traditions do you pass on to your children?

. A nurse caring for families in a free health care clinic assesses for psychosocial risk factors for altered family health. Which example best describes one of these risk factors?

a. The family does not have dental care insurance or resources to pay for it.
b. Both parents work and leave a 12-year-old child to care for his younger brother.
c. Both parents and their children are considerably overweight.
d. The youngest member of the family has cerebral palsy and needs assistance from community services.

. A nurse working in an "Aging in Place" facility interviews a married couple in their late 70s. Based on Duvall's Developmental Tasks of Families, what developmental task is most appropriate for the nurse to assess?

a. Maintenance of a supportive home base
b. Strength of the marital relationship
c. Ability to cope with loss of energy and privacy
d. Adjustment to retirement years

. A nurse working in a new community performs an assessment to determine the health of the community. What finding indicates a healthy community?

a. Meets all the needs of its inhabitants
b. Mixes residential and industrial areas
c. Offers access to health care services
d. Consists of modern housing and condominiums

. A nurse is practicing community-based nursing in a mobile health clinic. Which example best demonstrates

community-based nursing?

a. Caring for a mother and her child who have diabetes
b. Providing shelter for vulnerable populations within the community
c. Providing local same-day surgery facilities
d. Assisting families in crisis and overseeing the crisis hotline

. After receiving a change-of-shift report, the nurse on a medical-surgical unit sets initial priorities for care. According to Maslow's hierarchy of needs, which patient requires immediate assessment?

a. Patient requesting help to phone family to ask them to visit
b. Patient who needs education on changing their wound dressing prior to discharge
c. Patient who calls for assistance because they are breathing fast and feel faint
d. Patient who needs assistance to walk to the bathroom to void

ANSWERS WITH RATIONALES

. **b.** Maslow's hierarchy of basic human needs is useful for establishing priorities of care.

. **b, d.** Physiologic needs—oxygen, water, food, elimination, temperature, sexuality, physical activity, and rest—must be met at least minimally to maintain life. Providing food and oxygen are examples of interventions to meet these needs. Preventing falls helps meet safety and security needs; providing art supplies may help meet self-actualization needs; facilitating visits from loved ones helps meet self-esteem needs; and referring a patient to a support group helps meet love and belonging needs.

. **b.** By using meticulous hand hygiene and aseptic technique, nurses prevent infection, which falls under safety. An example of a physiologic need is clearing a patient's airway. Self-esteem needs may be met by allowing an older adult to talk about a past career. An example of helping meet a love and belonging need is contacting a hospitalized patient's family to arrange a visit.

. **c, e, f.** Self-actualization, or reaching your full potential, is a process that continues throughout life. A person achieves self-actualization by focusing on their unique capabilities, being creative, and demonstrating the capacity for happiness and affection for others. Humans are not born with a fully developed sense of self-actualization, and self-actualization needs are not met specifically by depending on others for help. Loneliness and isolation are not always the result of unmet self-actualization needs.

. **d.** Families likely share beliefs and values about health and illness. The nurse can help reduce risk for all family members at any level of development and recognizes interdependence of families affect one another in illness and health promotion.

. **a, d.** The five major areas of family function are physical, economic, reproductive, affective and coping, and socialization. Affective areas of function include feelings and coping, assessed by determining who provides emotional support in times of stress. Assessing the financially responsible individual focuses on the economic function. Inquiring about having more children assesses the reproductive function, asking about family traditions assesses the socialization function, and checking the environment assesses the physical function.

. **b.** Inadequate childcare resources are a psychosocial risk factor. Not having access to dental care and obese family members are lifestyle risk factors. Having a family member with birth defects is a biologic factor.

. **d.** The developmental tasks of the family with older adults are to adjust to retirement and possibly to adjust to the loss of a spouse and loss of independent living. Maintaining a supportive home base and strengthening marital relationships are tasks of the family with adolescents and young adults. Coping with loss of energy and privacy is a task of the family with children.

. **c.** A healthy community offers access to health care services to treat illness and to promote health. A healthy community cannot usually meet all the needs of its residents, but should be able to help with health issues such as nutrition, education, recreation, safety, and zoning regulations to separate residential sections from industrial areas. The age of housing is irrelevant as long as residences are maintained according to code.

. **a.** Community health nursing focuses on whole populations within a community, and community-based nursing is centered on the health care needs of individuals and families. Nurses practicing community-based nursing provide interventions to manage acute or chronic health problems, promote health, and facilitate self-care.

. **c.** The nurse prioritizes the patient with rapid breathing who feels faint, who may need oxygen or additional assistance with physiologic needs. Family visits help meet love and belonging needs, while assisting the patient to prevent falls and proper dressing change technique meets safety and security needs.

5

Culturally Respectful Care

Danielle Dorvall

Danielle is an immigrant from Haiti who has been in the United States for approximately 8 months. She recently had surgical repair of a fractured femur and is now confined to a hospital bed in skeletal traction. She asks that a Haitian folk healer from her neighborhood be allowed to come to the hospital to help heal her broken leg.

Khalifa Abdul Hakim

Khalifa, the husband of a Muslim patient, requests that only female health care providers care for his wife. In the Muslim culture, it is deemed immodest for a married woman's body to be seen by any male other than her husband.

Janice Goldberg

Janice, a 23-year-old woman of Jewish ancestry, comes to the women's health clinic for a routine examination. During the visit, she asks, "I've been dating this man who also is Jewish, and we're thinking about getting married and having children. But I've heard about a hereditary disorder called Tay-Sachs

disease that occurs in Jewish people. Should I be concerned?”

Learning Outcomes

After completing the chapter, you will be able to accomplish the following:

. Explain concepts of cultural diversity and respect.
. Describe influences that affect culturally respectful health care.
. Discuss examples of how diversity affects health and illness care, including culturally based traditional care.
. Identify factors commonly included in a transcultural assessment of health-related beliefs and practices.
. Practice cultural respect when assessing and providing nursing care for patients from diverse cultural groups.
. Discuss factors in the health care system and in nursing that facilitate or impede culturally competent nursing care.

Nursing Concepts

Identity (including culture/diversity)

Key Terms

cultural assimilation
cultural blindness
cultural competence
cultural diversity
cultural humility
cultural imposition
cultural respect
culturally competent care
culture
culture conflict
culture shock
ethnicity
ethnocentrism
implicit bias
intersectionality
linguistic competence
personal space
stereotyping
subcultures
transcultural nursing

Analysis of the 2010 U.S. census data reveals sweeping changes over the last 20 years. The U.S. population is bigger, older, more Hispanic and Asian, and less inclined toward marriage and traditional families than in 1990. Other trends reveal that the United States is more embracing of several generations living under one roof, more inclusive of same-sex couples, more aware of multiracial identities, more suburban, and less rural. “The end of the first decade of the 21st century marks a turning point in the nation’s social, cultural, geographic, racial and ethnic fabric. It’s a shift so profound that it reveals an America that seemed unlikely a mere 20 years ago—one that will influence the nation for years to come in everything from who is elected to run the country, states and cities to what types of household will be built and where” (El Nassar & Overberg, 2011).

An essay in *The Economist* in 2020 noted that baby boomers (born between 1946 and 1964) have dominated American politics since the 1990s, when they became the largest living generation and started to cast the largest number of votes. The year 2020, however, might be called the year of the young, in which protesters against racial injustice have mostly been in their 20s. The young have also been hardest hit by the consequences of the COVID-19 virus (losing jobs

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

or taking a significant pay cut). "America is moving from largely white, baby-boomer-dominated politics and culture in the second half of the 20th century to a more racially diverse country fuelled by younger generations: millennials [born between 1981 and 1996], Gen Z-ers and their juniors." This report continues:

> Younger generations differ from their elders in attitudes, ethnicity, and education…. millennials and Gen Z-ers are most likely to say governments should do more to solve problems, that same-sex marriage is good for society, that climate change is caused by human activity and that blacks are treated less fairly than whites (*The Economist*, 2020).

The essential knowledge and skills for understanding cultural diversity and providing thoughtful, person-centered culturally respectful care have become essential components of nursing practice. For an example, see the accompanying Reflective Practice display. This chapter focuses on concepts of cultural diversity and cultural respect and discusses their influence on nursing care.

CONCEPTS OF CULTURAL DIVERSITY AND RESPECT

Cultural diversity is the coexistence of different ethnic, sex assigned at birth, racial, and socioeconomic groups within one social unit. These groups include, but are not limited to, people of varying religion, language, physical size, sexual orientation, age, disability, occupational status, and geographic location. Culture is an integral component of both health and illness because of the cultural values and beliefs that we learn in our families and communities. Nurses and other health care providers must be familiar with the concepts of cultural diversity in order to understand characteristics common to certain populations.

Nurses must also be sensitive to cultural factors in order to provide culturally respectful care to people from diverse backgrounds. The concept of **cultural respect** enables nurses to deliver services that are respectful of and responsive to the health beliefs, practices, and cultural and linguistic needs of diverse patients. Moreover, cultural respect is critical to reducing health disparities and improving access to high-quality health care (National Institutes of Health [NIH], 2017).

It is also vital to remember that each person may be a member of multiple cultural, ethnic, and racial groups at one time. Therefore, different cultural values may guide a person in different situations based on what is most important to that person at the time. In addition, any person should be viewed foremost as an individual, not as a representative of a cultural group. **Intersectionality** refers to the simultaneous experience of categorical and hierarchical classifications including, but not limited to, race, class, gender, sexuality, and nationality. It also refers to the fact that what is often perceived as disparate forms of oppression, such as racism, classism, sexism, and xenophobia, are actually mutually dependent and intersecting in nature, and together they compose a unified system of oppression. Thus, the privileges we enjoy and the discrimination we face are a product of our unique positioning in society as determined by these social classifiers (https://www.thoughtco.com/intersectionality-definition-3026353).

Culture

Culture is a shared system of beliefs, values, and behavioral expectations that provides social structure for daily living. The NIH defines culture as the combination of a body of knowledge, a body of belief, and a body of behavior. Elements include personal identification, language, thoughts, communications, actions, customs, beliefs, values, and institutions that are specific to ethnic, racial, religious, geographic, or social groups. For nurses who practice thoughtful, person-centered care, these elements influence beliefs and belief systems surrounding health, healing, wellness, illness, disease, and delivery of health services.

QSEN Reflective Practice: Cultivating QSEN Competencies

CHALLENGE TO INTELLECTUAL SKILLS

I had thought that I was pretty much used to all sorts of questions from patients about why a guy like me would go into nursing. Today, however, I was surprised when Khalifa Abdul Hakim, the husband of a newly admitted patient, demanded that I leave his wife's room immediately. Stepping into the corridor with me, he explained that he and his family were Muslim and that in their culture it was deemed immodest for the body of a married woman to be seen by any male other than her husband. He asked me to make sure it was clear in his wife's chart that there should be no male nurses. He also asked about female physicians. Since we were short-staffed and all trying to cover for one another to get through the day, I wasn't sure that I could make that promise, especially since our unit has three or four male nurses. I wasn't clear if this was just a personal preference or a religious or cultural matter or both, or if it really mattered at all. I had absolutely no clue how to respond. I understood the importance of culturally appropriate care, but couldn't remember learning how to respond to a request like this. I also wasn't sure if the hospital had a policy about something like this.

Thinking Outside the Box: Possible Courses of Action

- Find someone to swap patients with me and just not have to deal with the situation (probably the simplest response).
- Use the opportunity to research Muslim culture and talk with the patient's male family members about what is important to them. Since we are seeing more Muslim patients, suggest an in-service program on this topic for everyone.
- Explain to Mr. Hakim that his wife is in a U.S. hospital, and that while here, they should observe U.S. customs, meaning she may have male nurses or other male health care providers.
- Check the hospital's policy about this request and then follow it.

Evaluating a Good Outcome: How Do I Define Success?

- I know enough to do whatever is necessary to ensure the patient's health and well-being as well as respect the integrity of all participants involved.
- The patient and her family feel sufficiently comfortable in our environment (culturally appropriate care) for healing to be maximized.
- I know more at the end of the experience than when I started.

Personal Learning: Here's to the Future!

I was pretty surprised when two of the older, more experienced nurses said they had never encountered such a request and they didn't know if the hospital had a policy about it. Luckily, one of them referred me to our patient-advocate person, and she came right up to the unit. I had never met her before, but I was impressed with her knowledge and her strong commitment to patient advocacy. She showed me the hospital policy that obligates all workers to respect the beliefs and values of patients unless this entails compromising their own integrity or the safety of other persons. She said that we will be seeing more Muslim patients in the future and recommended a website to get more information. I haven't checked it out yet, but I did talk some with the patient's family and have a better understanding why this matters to them. So now I'm trying to cultivate the attitude that each patient and family could be an important learning opportunity for me if I'm open to what they have to teach!

QSEN SELF-REFLECTION ON QUALITY AND SAFETY COMPETENCIES DEVELOPING KNOWLEDGE, SKILLS, AND ATTITUDES FOR CONTINUOUS IMPROVEMENT

How do you think you would respond in a similar situation? Why? Do you agree with the criteria this nursing student used to evaluate a successful outcome? Why or why not? What *knowledge, skills,* and *attitudes* do you need to develop to improve the quality and safety of care for families like the Hakims?

Patient-Centered Care: What role does the nurse's cultural sensitivity, respect, and accommodation play in creating a successful person-centered partnership with the Hakims? What lessons did the student learn about the importance of cultural humility and competence?

Teamwork and Collaboration/Quality Improvement: What communication skills do you need to improve to ensure that you function as a valuable member of the patient-care team and to obtain assistance when needed? What did you learn about the importance of a referral—in this case to the patient advocate? How could this experience be used to improve care for other Muslim families?

Safety/Evidence-Based Practice: What role should safety considerations play in evaluating whether or not there was adequate staff to meet Mr. Hakim's request? Are there research studies about how best to accommodate cultural beliefs and preferences?

Informatics: Can you identify the essential information that must be available in Ms. Hakim's electronic record to support safe patient care and coordination of care? Can you think of other ways to respond to or approach the situation?

Culture influences roles and interactions with others as well as within families and communities and is apparent in the attitudes and institutions unique to particular groups (Andrew et al., 2020). The characteristics of culture include the following:

- Culture helps shape what is acceptable behavior for people in a specific group. It is shared by, and provides an identity for, members of the same cultural group.
- Culture is learned by each new generation through both formal and informal life experiences. Language is the primary

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

means of transmitting culture.

- The practices of a particular culture often arise because of the group's social and physical environment.
- Cultural practices and beliefs may evolve over time, but they mainly remain constant as long as they satisfy a group's needs.
- Culture influences the way people of a group view themselves, have expectations, and behave in response to certain situations. Because a culture is made up of people, there are differences both within cultures and among cultures.

Recall **Mr. Hakim**, the Muslim man described in the Reflective Practice display. The nurse's knowledge of his culture and beliefs are important for ensuring culturally respectful care as well as staffing needs. The nurse needs to understand actions and behaviors that would be acceptable to Mr. Hakim and his wife.

Within most cultures are **subcultures**. A subculture is a large group of people who are members of the larger cultural group but who have certain ethnic, occupational, or physical characteristics that are not common to the larger culture. For example, nursing is a subculture of the larger health care system culture, and teenagers and older adults are often regarded as subcultures of the general population in the United States.

Most societies include both dominant culture groups and minority culture groups. The dominant group has the most ability to control the values and sanctions of the society. It usually is (but does not have to be) the largest group in the society. Minority groups usually have some physical or cultural characteristic (such as race, religious beliefs, or occupation) different from those of the dominant group.

When a minority group lives within a dominant group, many members may lose the cultural characteristics that once made them different, and they may take on the values of the dominant culture. This process is called **cultural assimilation** or acculturation. For example, when people immigrate and encounter a new dominant culture as they work, go to school, and learn the dominant language, they often move closer to the dominant culture. The process and the rate of assimilation are individualized.

Mutual cultural assimilation also occurs, with both groups taking on some characteristics of the other. For example, many Hispanic immigrants to the United States learn to speak English, and many Americans learn to cook and enjoy traditional Hispanic foods. We all gain from the many cultures with which we live. Although we seldom think about it, the clothes we wear, the foods we eat, the music we enjoy, many of the words we use, and the leisure activities we practice are all influenced by acculturation.

A person may experience **culture shock** when placed in a different culture they perceive as strange. Culture shock may result in psychological discomfort or disturbances, because the patterns of behavior a person found acceptable and effective in their own culture may not be adequate or even acceptable in the new culture. The person may then feel foolish, fearful, incompetent, inadequate, or humiliated. These feelings can eventually lead to frustration, anxiety, and loss of self-esteem.

Ethnicity

Ethnicity is a sense of identification with a collective cultural group, largely based on the group members' common heritage. One belongs to a specific ethnic group or groups either through birth or through adoption of characteristics of that group. People within an ethnic group generally share unique cultural and social beliefs and behavior patterns, including language and dialect, religious practices, literature, folklore, music, political interests, food preferences, and employment patterns. Ethnicity largely develops through day-to-day life with family and friends within the community.

Race

Although the term *ethnicity* is often used interchangeably with race, these terms are not the same. Racial categories are typically based on specific physical characteristics such as skin pigmentation, body stature, facial features, and hair texture. Because of the significant blending of physical characteristics through the centuries, however, race is becoming harder to define using simple classifications, and physical characteristics are not considered a reliable way to determine a person's race. Federal standards for race classification provide five categories, Native American or Alaska Native, Asian, Black or African American, Native Hawaiian or Other Pacific Islander, and White, and provide the opportunity for people to identify themselves in multiple categories.

In recent years, the concept of "race" has become increasingly controversial (Park et al., 2021). The authors contrast the historical thinking that racial categories reflect our genetic composition, making it a *biologic* concept with the more

recent thinking of race as a *socially constructed* concept. If the more recent thinking is correct, "using a racial category as an attributing factor for undesirable health conditions may reinforce racism and that such attribution may not be scientifically warranted because association isn't causation" (p. 5). See also Chadha et al. "Toward the abolition of biological race in medicine" (2020).

Factors Inhibiting Sensitivity to Diversity

A variety of factors may affect a person's sensitivity to others. When one assumes that all members of a culture, ethnic group, or race act alike, **stereotyping** is at work. Stereotyping may be positive or negative. Negative stereotyping includes racism, ageism, and sexism. These are mistaken beliefs that certain races, an age group, or one biologic sex is inherently superior to others, leading to discrimination against those considered inferior. Take a moment to look carefully at the images in Figure 5-1. What assumptions might you bring to your encounters with these people? Are you aware of any personal biases that could influence the way you respond to them? Many of us aren't even aware of biases that influence our ability to create respectful, trusting relationships. When we hold attitudes toward people or associate stereotypes with them without our conscious knowledge it is called **implicit bias**. If you have never taken the implicit bias test, check it out: https://implicit.harvard.edu/implicit/takeatest.html. What did you learn about any personal biases that you may not have recognized that you hold?

FIGURE 5-1. Identifying our own prejudices is the first step toward eliminating them. Think about the assumptions you make regarding the people in these images. (*Source:* Used with permission from Shutterstock. Top row, from left to right: *Photos by Fotos593*, *FabrikaSimf*, *pixelheadphoto digitalskillet*, *Hagen Production*, *fizkes*. Bottom row, far right: *Photo by wavebreakmedia*.)

Also affecting cultural sensitivity are **cultural imposition**, which is the belief that everyone else should conform to your own belief system, and **cultural blindness**, which occurs when one ignores differences and proceeds as though they do not exist. Cultural imposition and cultural blindness can be observed within the health care system, especially in regard to nonmainstream methods of care. **Culture conflict** occurs when people become aware of cultural differences, feel threatened, and respond by ridiculing the beliefs and traditions of others to make themselves feel more secure about their own values (Andrews et al., 2020).

CULTURAL INFLUENCES ON HEALTH CARE

The United States is multicultural, multiethnic, and multiracial. The U.S. Census Bureau (2019a) projected that net international migration is expected to add one person to the U.S. population every 34 seconds. Therefore, nurses must be aware of, and sensitive to, the needs of a diverse patient population. Most people interpret the behaviors of others in terms of their own familiar culture. This process usually works both ways; for example, in a health care setting, the patient evaluates the attitudes and actions of the health care provider at the same time the health care provider interprets the behavior of the patient. What may seem reasonable and important to a patient may seem ridiculous and irrelevant to an insensitive nurse. The reverse is also true: practices a nurse perceives as logical and effective may seem senseless or even dangerous to a patient.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Consider **Danielle Dorvall**, described at the beginning of the chapter. She might view skeletal traction as worthless, while the nurse may view her request for a folk healer in the same way. The nurse needs to be aware of these possible attitudes and beliefs to ensure maximum effective care while still meeting the patient's cultural needs.

The following sections describe general considerations in providing **culturally competent care**.

Physiologic Variations

Studies have shown that certain racial and ethnic groups are more prone to being diagnosed with certain diseases and conditions. For example, a hereditary disorder, Tay-Sachs disease, is associated with people of Eastern European Jewish descent. Although the incidence of this disorder has declined over the years owing to improved and earlier testing, it is still a concern. Use knowledge of such risk factors when interviewing a patient to complete a health history. Table 5-1 provides examples of diseases that are more often diagnosed in specific populations. This is not a comprehensive list.

Remember, according to the newer understanding of race as a socially constructed concept, the fact that cirrhosis of the liver and fetal alcohol syndrome are found more frequently in Native Americans and Alaska Natives does not mean that these individuals have a genetic propensity for these diseases, but rather that structural racism in the United States and elsewhere has produced living circumstances that promote these disorders more frequently in these communities—a critical distinction.

Table 5-1 Examples of Common Health Problems in Specific Populations

POPULATION	COMMON HEALTH PROBLEMS
Native American and Alaska Native	Heart disease Cirrhosis of the liver Diabetes mellitus Fetal alcohol syndrome
African American	Hypertension Stroke Sickle cell anemia Lactose intolerance Keloids
Asian	Hypertension Cancer of the liver Lactose intolerance Thalassemia
Hispanic	Diabetes mellitus Lactose intolerance
White	Breast cancer Heart disease Hypertension Diabetes mellitus Obesity
Eastern European Jewish	Cystic fibrosis Gaucher disease Spinal muscular atrophy Tay-Sachs disease

Recall **Janice Goldberg**, the young woman described at the beginning of the chapter. Knowledge of the Tay-Sachs disorder and screening and early detection methods would be important for the nurse to use as a foundation when counseling and teaching Janice.

Reactions to Pain

Health care researchers have discovered that many of the expressions and behaviors exhibited by people in pain are culturally prescribed. Some cultures allow or even encourage the open expression of emotions related to pain, whereas other cultures encourage suppression of such emotions.

You should not assume that a patient who does not complain of pain is not having pain. If you make this assumption, you may overlook the pain-reduction needs of a patient who deals with pain quietly and stoically. To avoid this error, be sensitive to nonverbal signals of discomfort, such as holding or applying pressure to the painful area, avoiding activities that intensify the pain, and uncontrollable, spontaneous expressions of discomfort, such as facial grimacing and moaning. You also should not consider patients who freely express their discomfort as constant complainers with excessive requests for pain relief. Pain is a warning from the body that something is wrong. Pain is what the patient says it is, and every complaint of pain should be assessed carefully.

Nursing care for a patient in pain is always individualized (see Chapter 36), but important culture-sensitive considerations include the following:

- Recognize that culture is an important component of individuality, and that each person holds (and has the right to hold) various beliefs about pain.
- Respect the patient's right to respond to pain in their own manner.
- Never stereotype a patient's perceptions of or responses to pain based on the person's culture.

Finally, if you study the history of medicine, you will find that professional caregivers held many incorrect beliefs about the pain patients perceived. For a long time, the belief that infants did not feel pain led to many painful procedures, such as the insertion of chest tubes or a circumcision being performed without any type of analgesia. Similarly, the longstanding beliefs that Black people did not experience pain like White people, routinely led to the undermanagement of their pain during painful procedures.

Mental Health

Most mental health data originated in research and observations made of White, middle-class people. But many ethnic groups have their own respectable patterns of behavior for psychological well-being as well as different psychological reactions to certain situations. For example, many Hispanic people deal with problems within the family and consider it inappropriate to tell problems to a stranger. Some Chinese people consider mental illness a stigma and seeking psychiatric help a disgrace to the family. In times of high stress or anxiety, some Puerto Rican individuals may demonstrate a hyperkinetic seizurelike activity known as *ataques*; this behavior is a culturally accepted reaction. Be aware of these variations and accept them as culturally appropriate (Giger & Davidhizer, 2020).

Assigned Sex Roles

In some cultures, the man is the dominant figure and generally makes decisions for all family members. For example, if approval for medical care is needed, the man may give it regardless of which family member is involved. In male-dominant cultures, women are often passive. On the other hand, in some cultures, women are dominant.

Knowing who is dominant in the family is important when planning nursing care. For example, if the dominant member is ill and can no longer make decisions, the whole family may be anxious and confused. If a nondominant family member is ill, the person may need help in verbalizing needs, particularly if the needs differ from those the dominant member perceives as being important.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Think back to **Mr. Hakim**, the Muslim man concerned about his wife's care providers being male. Because Mr. Hakim—not his wife—made the request about no male care providers, the nurse would interpret this as indicating that Mr. Hakim is the dominant family member. This assumption, however, would need to be tested.

Language and Communication

When people from another part of the world where English is not the dominant language move to the United States, they may speak their own language fluently but have difficulty speaking English. This is especially true for people in the family who do not work outside the home and for people who live in proximity to others who speak their primary language. Assimilation is likewise slower for people who stay at home, especially if they live in communities of their ethnic and cultural background. Children usually assimilate more rapidly and learn the language of the dominant culture quickly if they leave home each day to go to school and make new friends in the dominant culture. Wage earners also tend to learn a new language more quickly through the work setting. Language acquisition is thus tied to necessity and assimilation rather than to degree of difficulty.

Because the United States has such a diverse population, with many languages spoken, communication problems can arise during health care activities. This problem is not unique to non–English-speaking patients; even in different regions of the country, certain dialects or word meanings can cause differences in understanding. Consider how difficult it must be to describe symptoms or give a personal health history when you do not understand the questions being asked. In addition, patients may forget English words or revert to their more familiar language when experiencing the stress of an injury, illness, or pain. Imagine for a moment finding yourself in an emergency room with crushing chest pain in a foreign country where no one speaks your language. **Linguistic competence** refers to the ability of caregivers and organizations to understand and effectively respond to the linguistic needs of patients and their families in a health care encounter.

Nurses who work in a geographic area with a high population of residents who speak a language other than English should learn pertinent words and phrases in that language. (See the accompanying Through the Eyes of a Student account on page 102.) Many facilities also have a qualified interpreter, or one can be found in the community. To avoid misinterpretation of questions and answers, it is important to use an interpreter who understands the health care system. Sometimes a family member or friend can translate for the nurse, but such a person may be protective and not the most reliable means of transferring information; thus, guidelines discourage using family members or friends as translators.

QSEN PATIENT-CENTERED CARE

Be sure you are familiar with the resources available in your agency and policies for interacting with people who do not speak English. You should know that not infrequently professional caregivers are reluctant to secure the assistance of trusted interpreters because this involves more time than usual.

Keep in mind that talking more loudly to someone who does not understand what you are saying is not helpful. Remember that language difference is a communication problem, not a hearing problem. Make sure you are familiar with the linguistic resources available in your practice settings and pertinent policies.

The U.S. Department of Health and Human Services Office of Minority Health created a health care language services implementation guide to help health care organizations implement effective language access services to meet the needs of their patients with limited English proficiency, thereby increasing their access to health care. You will find this guide, along with many other helpful resources at the website http://www.minorityhealth.hhs.gov. Also see Marcus, MacMillan, Ketchie, and Clark (2020) for a study of how nurses perceive technology used in language interpretation for patients with limited English proficiency.

Through the Eyes of a Student

I was doing my maternity rotation and was assigned to labor and delivery. I was caring for a woman who spoke no English—she and her husband were from Central America and had been in the United States for only 2 months.

When I arrived at 7 AM, the night nurse was giving a report about my patient to the day nurse. The night nurse was frantic—no one understood the couple, all efforts to locate a translator had come up empty, and, quite frankly, she had

no idea exactly what condition this woman was in.

I quickly began to think back on my 2 years of Spanish. Could I be of any help to this couple? I wondered. Would I remember enough to communicate with them about giving birth? Then I decided that any little bit of communication at this point was better than none, so I spoke up. I told both nurses that I spoke some Spanish and asked if I could be of any help. The night nurse literally hugged me!

I began by telling the expectant couple that I was a nursing student and that I spoke some Spanish. We exchanged introductions and then I asked the woman some assessment questions. Nothing I said was complicated—all of my sentences were short and simple, but who needed more than that?

Then the couple asked me some questions. They had heard about "cutting open the stomach" to deliver a baby. I naturally assumed that they meant a cesarean delivery. They looked so afraid but I had to be honest. They wanted to know how it was done and why. The words I could not remember or did not know I acted out. They looked so relieved when I was finished.

The man said that they thought all babies were born this way in our country. He said that they had never heard of this procedure until coming to the United States. No wonder they were so frightened!

The doctor came in, examined the woman, and said she was fully dilated. The doctor asked if I could teach a crash course in Lamaze breathing to the woman. She also asked me if I would stay throughout the delivery because she would need assistance in translating directions to the woman. Of course, I said yes.

The woman was terrified. I told her that it was normal to be afraid and that I would be with her during the delivery. She took my hand and whispered, "Muchas gracias." I never felt more useful than I did at that moment.

—A. Kelly Gaylor, *Holy Family College*, *Philadelphia*

One of the most culturally variable forms of nonverbal communication is eye contact. The American-dominant culture emphasizes eye contact while speaking, but many other cultures regard this behavior in different ways. For example, direct eye contact may be considered impolite or aggressive by many people who are Asian, Native American, Indochinese, Middle Eastern and North African (MENA), and Appalachian; people from these groups may avert their eyes while speaking. Hispanic people may look downward in deference to age, assigned sex, social position, economic status, or authority. Muslim–Arab women often indicate modesty by avoiding eye contact with men, and Hasidic Jewish men may avoid direct eye contact with women (Andrews et al., 2020). Although the above examples are not true of all members of a group, they provide some general guidelines.

When caring for a patient from a cultural or ethnic group different from your own, it is important to perform a transcultural assessment of communication (Andrews et al., 2020):

- What language does the patient speak during usual activities of daily living?
- How well does the patient speak and write in English?
- Does the patient need an interpreter? Are there people the patient would not want to serve as an interpreter?
- How does the patient prefer to be addressed?
- What cultural values and beliefs of the patient (such as eye contact, personal space, or social taboos) may change your techniques of communication and care?
- How does the patient's nonverbal behavior affect the responses of members of the health care team?
- What are the cultural characteristics of the patient's communications with others?

Chapter 8 provides additional information on communicating with non–English-speaking patients. Box 5-1 illustrates two mnemonics which may be helpful if you are intent on developing culturally sensitive medical interviewing skills.

Orientation to Space and Time

Personal space is the area around a person regarded as part of the person. This area, individualized to each person and to different cultures and ethnic groups, is the area into which others should not intrude during personal interactions. If others do not consider a person's personal space, that person may become uncomfortable or even angry. When providing nursing care that involves physical contact, you should know the patient's cultural personal space preferences. For example, people from some Middle Eastern and African cultures commonly sit and stand close to one another when talking, whereas people of from some Asian and European cultures may be more comfortable with more distance between themselves and others.

Box 5-1 Culturally Sensitive Medical Interviewing Tools

Ethnic

E. Explanation (How do you explain your illness?)
T. Treatment (What treatment have you tried?)
H. Healers (Have you sought any advice from folk healers?)

N. Negotiate (mutually acceptable options)
I. (Agree on) intervention
C. Collaboration (with patient, family, and healers)

Learn Model

L. Listen to the patient's perspective
E. Explain and share your own perspective
A. Acknowledge differences and similarities between these two perspectives
R. Recommend a treatment plan
N. Negotiate a mutually agreed-on treatment plan

Source: Cultural Competency, College of Medicine, Medical University of South Carolina, http://etl2.library.musc.edu/cultural/communication/communication_4.php

Many people and almost all institutions in the United States value promptness and punctuality. When arriving for an appointment, doing a job, or carrying out an activity, being on time and getting the job done promptly are viewed as important. This is not true in some other cultures. For example, in some South Asian cultures, being late is considered a sign of respect. In addition, while some cultures are future oriented (including activities that promote future good health), other cultures are more concerned with the present or the past. Understanding the patient's orientation to time is important as you communicate, for example, the need to be on time for appointments for health care procedures and when taking medications.

Food and Nutrition

Food preferences and preparation methods often are culturally influenced. Certain food groups serve as staples of the diet based on culture and remain so even when members of that culture are living in a different country.

Patients in a hospital or long-term care setting often do not have much choice of foods. This means that people with cultural food preferences may not be able to select appealing foods and thus may be at risk for inadequate nutrition. When assessing the possible causes of a patient's decreased appetite, try to determine whether the problem may be related to culture. It may be possible for family or friends to bring in foods that satisfy the patient's nutritional needs while still meeting dietary restrictions. Dietary teaching must be individualized according to cultural values about the social significance and sharing of food.

Family Support

In many cultural and ethnic groups, people have large, extended families and consider the needs of any family member to be equal to or greater than their own. They may be unwilling to share private information about family members with those outside the family (including health care providers). Other cultural groups have great respect for the elders in the family and would never consider institutional care for them. Including the family in planning care for any patient is a major component in nursing care to meet individualized needs, especially if those needs can be met only through consideration of all members of the family.

Socioeconomic Factors

Low income is a major problem in the United States and is often described as having created a culture of poverty. A report from the U.S. Census Bureau (2019b) noted that an estimated 11.8% of the U.S. population had an income below the poverty threshold. Of that population, the lowest income was found in African Americans, Native Americans, and Alaska Natives. In 2018, 16.2% of all children lived in poverty—that's about one in every five children. On a single night in January 2016:

- An estimated 194,716 people in families, or 61,265 family households were identified as homeless. See Macenroe-Petitte (2020) for a comprehensive article on care for patients who are homeless.
- More than 19,000 were living on the street, in a car, or in another place not meant for human habitation.
- 120,819 were children under the age of 6 (National Alliance to End Homelessness, n.d.).

At the time of writing this chapter, data are not available to see how the pandemic has affected poverty rates in the United States and homelessness. We do know that children and adults face poverty and hunger in every county across the United States. Feeding America reported in 2021 that:

- In 2019, 34 million people lived in poverty in America. For a family of four, that means earning just $25,000 per year.
- Before the coronavirus pandemic, more than 35 million people struggled with hunger in the United States, including more than 10 million children.
- A household that is food insecure has limited or uncertain access to enough food to support a healthy life.
- Children are more likely to face food insecurity than any other group in the United States.
- The coronavirus pandemic has left millions of families without stable employment. More than 50 million people, including 17 million children, may experience food insecurity (https://www.feedingamerica.org/hunger-in-america/facts).

There has been much debate about how to define poverty. In terms of economics, a person or family whose income falls below an established threshold is considered to be experiencing poverty. The U.S. Census Bureau defines poverty according to money or income guidelines that vary by family size and composition. If the family's total income is less than a set threshold, all members of the family are considered to be experiencing poverty. Others have stated that poverty is a relative term that reflects a judgment based on community standards. Such standards vary at different times and in different places; what is judged to be poverty in one community might be regarded as wealth in another (Spector, 2017). No matter how poverty is defined, it is an increasingly devastating epidemic, fueled by real estate foreclosures and credit debt that has evolved into a culture of its own. At highest risk are children, older people, families headed by single mothers, and the future generations of those now living in poverty. Access to financial resources affects how individuals and families meet their basic needs and maintain their health. Poverty often leads to problems such as lack of health insurance, inadequate care of infants and children, lack of access to basic health care services, and homelessness. All these are of concern to nursing.

The feminization of poverty threatens to increase the number of people who are living at poverty level. The number of female-headed households is increasing as a result of divorce, abandonment, unmarried motherhood, and changes in abortion laws. Because it is now common that two incomes are required in a household for economic survival, a single woman supporting a household is at a financial disadvantage. The number of single-parent families headed by women is associated closely with the increasing number of children living in poverty and the number of homeless families with children.

The increasing population of older people has also raised problems associated with poverty. Many older people live on fixed incomes that often do not keep up with inflation, and many (particularly widows) are on the borderline of poverty or have already slipped below the poverty level. Socioeconomic status often differs by the cultural group of the older adult. For example, Pacific/Asian, African American, Native American, and Hispanic elders generally have lower incomes than elders in the majority population. The work history of the cultural group, especially those who have labored all their lives as agricultural workers, often means that a person has no Social Security or Medicare benefits.

In some cases, the culture of poverty is passed from generation to generation. This appears to be especially true in such groups as migrant farm workers, families living on public assistance, and people who live in isolated areas such as Appalachia. Poverty cultures often have the following characteristics:

- Feelings of despair, resignation, and fatalism
- "Day-to-day" attitude toward life, with no hope for the future
- Unemployment and need for financial or government aid
- Unstable family structure, possibly characterized by abusiveness and abandonment
- Decline in self-respect and retreat from community involvement

Poverty has long been a barrier to adequate health care. It prevents many people from consistently meeting their basic human needs. The lack of affordable or adequate housing is a problem experienced frequently by those in poverty. When low-income housing is available, it sometimes lacks such necessities as running water, heat, and electricity. To stretch their available money and to pool resources, many people live in crowded conditions, with several families living together in one household.

Research has demonstrated that crowded living conditions foster depersonalization, correlate with higher crime rates, and lead to psychological problems such as schizophrenia, alienation, and feelings of worthlessness (Spector, 2017). Such conditions also contribute to an increased incidence and severity of disease and illness because of the closer proximity of people, the sharing of utensils and belongings, poor sanitation, and poor health habits.

Accessing health care facilities frequently requires transportation, which often is neither affordable nor available to people experiencing poverty. Their access to health insurance also is frequently limited, and they often must choose between purchasing food and obtaining health care. Those in upper-income groups tend to live longer and to experience less disability than those in lower-income groups. Other barriers to health care include isolation, language or communication difficulties, seasonal occupations, migration patterns, depersonalization, and institutional prejudice (Spector, 2017).

Concept Mastery Alert

The increase in the number of single-parent female families (also known as the feminization of poverty), has had the greatest potential for increasing the number of people living in poverty.

Health Disparities

The term *health disparities* refers to health differences between groups of people; they can affect how frequently a disease affects a group, how many people get sick, or how often the disease causes death. You can read more about disparities in Chapters 3 and 4. Many different populations are affected by disparities, including racial and ethnic minorities; residents of rural areas; women, children, and older adults; and persons with disabilities.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

CULTURAL INFLUENCES ON HEALTH AND ILLNESS

People's values and beliefs about health, illness, and health care are influenced by cultural, ethnic, or religious groups. For example, in some groups, illnesses are classified as either natural or unnatural. "Natural illnesses" are caused by dangerous agents, such as cold air or impurities in the air, water, or food. "Unnatural illnesses" are punishments for failing to follow God's rules, resulting in evil forces or witchcraft causing physical or mental health problems.

In some cultures, the power to heal is thought to be a gift from God bestowed on certain people. People in these cultures believe that these folk or traditional healers know what is wrong with them through divine intervention and experience. A patient accustomed to traditional healers may think that health care providers are incompetent because they have to ask many questions before they can treat an illness. Traditional healers speak the patient's primary language, often are more accessible, and are usually more understanding of the patient's cultural and personal needs.

Think back to **Danielle Dorvall**, the immigrant from Haiti asking for a folk healer. Respecting her use of a folk healer, as appropriate, would demonstrate an understanding of her cultural beliefs.

People from different cultures may also have different beliefs about the best way to treat an illness or disease. For example, herbs are a common method of treatment in many cultures. In fact, many medications used today have a basis in herbs or other plant sources that have been used for centuries to cure illnesses. If a patient traditionally drinks an herbal tea to alleviate symptoms of an illness, there is no reason that both the herbal tea and prescribed medications cannot be used, as long as the tea is safe to drink and the ingredients do not interfere with or exaggerate the action of the medication.

Other traditional therapies include the use of cutaneous stimulation, therapeutic touch, acupuncture, and acupressure. Cutaneous stimulation by massage, vibration, heat, cold, or nerve stimulation reduces the intensity of the sensation of pain. Therapeutic touch is an intentional act that involves an energy transfer from the healer to the patient to stimulate the patient's own healing potential. Acupuncture, long used in China, is a method of preventing, diagnosing, and treating pain and disease by inserting special needles into the body at specified locations. Acupressure involves a deep-pressure massage of appropriate points of the body. Read more about these therapies in Chapter 29.

CULTURALLY RESPECTFUL NURSING CARE

Providing culturally respectful nursing care means that care is planned and implemented in a way that is sensitive to the needs of individuals, families, and groups from diverse populations within society. Among the elements of **cultural competence** (Purnell, 2014) are the following:

- Developing an awareness of your own existence, sensations, thoughts, and environment to prevent them from having an undue influence on those from other backgrounds
- Demonstrating knowledge and understanding of the patient's culture, health-related needs, and culturally specific meanings of health and illness
- Accepting and respecting cultural differences in a manner that facilitates the patient's and family's abilities to make decisions to meet their needs and beliefs
- Not assuming that the health care provider's beliefs and values are the same as the patient's
- Resisting judgmental attitudes such as "different is not as good"
- Being open to and comfortable with cultural encounters
- Accepting responsibility for your own education in cultural competence by attending conferences, reading professional literature, and observing cultural practices

These elements suggest that becoming culturally competent is a life-long challenge, and that nurses should strive to be culturally humble—recognizing what we don't yet know about those entrusted to our care and being willing to learn what we need to know. The Office of Minority Health of the U.S. Department of Human Services created "Think Cultural Health" (https://www.thinkculturalhealth.hhs.gov), an online service whose goal is to advance health equity at every point of contact through the development and promotion of culturally and linguistically appropriate services. Nurses who recognize and respect cultural diversity are better equipped to exhibit cultural sensitivity and provide

nursing care that accepts the significance of cultural factors in health and illness. See Box 5-2 for other helpful web resources.

The health care system is itself a culture with customs, rules, values, and a language of its own, with nursing as its largest subculture. As you progress through your education, you will be acculturated into the culture of the health care system and will develop values related to health and health care. Box 5-3 (on page 106) lists some common cultural norms of the health care system.

Although nursing as a whole is actively recruiting more diverse members, many nurses are members of, and have the same value systems as, the dominant U.S. middle-class culture. When a nurse with a particular set of cultural values about health interacts with a patient with a different set of cultural values about health, the following factors affect this interaction (Andrews et al., 2020):

Box 5-2 **Multicultural Web Resources**

Diseases and Conditions, Centers for Disease Control and Prevention

www.cdc.gov/DiseasesConditions

Provides information on all diseases but concentrates on infectious disease topics. Available in English and Spanish.

EthnoMed

www.ethnomed.org

Provides information on cultural beliefs, medical issues, and related topics pertinent to the health care of immigrants in Seattle and throughout the United States. It focuses on Cambodian, Ethiopian, Hispanic, Oromo, Somali, Tigrean, and Vietnamese cultures.

Health Information Translations

www.healthinfotranslations.org

Health education resources in multiple languages for diverse populations. Searchable by keyword, topic, and language.

Healthy Roads Media

www.healthyroadsmedia.org

A source of health information on over 100 topics and patient education materials in many formats. Search by topic or language.

MedlinePlus

https://medlineplus.gov/languages/languages.html

Allows users to browse for authoritative health information in over 50 languages.

U.S. Committee for Refugees and Immigrants

http://refugees.org/research-reports

Culturally appropriate material for consumers and health care professionals. Search by topic or language.

Box 5-3 **Cultural Norms of the Health Care System**

Beliefs

- Standardized definitions of health and illness
- Omnipotence of technology
- Critical importance of safety and quality measures

Practices

- Maintenance of health and prevention of illness
- Annual physical examinations and diagnostic procedures

Habits

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

- Documentation
- Frequent use of jargon
- Use of a systematic approach and problem-solving methodology

Likes

- Promptness
- Neatness and organization
- Compliance

Dislikes

- Tardiness
- Disorderliness and disorganization

Customs

- Professional deference and adherence to the pecking order found in autocratic and bureaucratic systems
- Use of certain procedures attending birth and death

- The cultural background of each participant
- The expectations and beliefs of each about health care
- The cultural context of the encounter (e.g., hospital, clinic, home)
- The extent of agreement between the two persons' sets of beliefs and values

The ESFT model (**E**xplanatory model of health and illness, **S**ocial and environmental factors, **F**ears and concerns, **T**herapeutic contracting) is a cross-cultural communication tool that helps health care professionals strengthen communication and identify potential threats to treatment adherence (Box 5-4). Nurses can use this model to improve health care outcomes and address health disparities.

Nursing care can become complicated when the patient and the nurse have distinctly different cultural norms. Cultural imposition in health care is the tendency for health personnel to impose their beliefs, practices, and values on people of other cultures. Closely related to cultural imposition is **ethnocentrism**, the belief that the ideas, beliefs, and practices of one's own culture are superior to those of another's culture. When health professionals assume that they have the right to make choices and decisions for patients of another culture, patients may respond in the same way that minority cultures often respond to such an attitude by the dominant culture: by becoming passive, resistive, angry, or resistant to treatment.

Box 5-4 The ESFT Model

The ESFT model guides providers in understanding a patient's explanatory model (a patient's conception of their illness), social and environmental factors, and fears and concerns, and also guides providers in contracting for therapeutic approaches.

E—Explanatory Model of Health and Illness

- What do you think caused your problem?
- Why do you think it started when it did?
- How does it affect you?
- What worries you most?
- What kind of treatment do you think you should receive?

S—Social and Environmental Factors

- How do you get your medications?
- Are they difficult to afford?
- Do you have time to pick them up?
- How quickly do you get them?
- Do you have help getting them if you need it?

F—Fears and Concerns

- Does the medication sound okay to you?
- Are you concerned about the dosage?
- Have you heard anything about this medication?

- Are you worried about the adverse effects?

T—Therapeutic Contracting

- Do you understand how to take the medication?
- Can you tell me how you will take it?

Source: The U.S. Department of Health and Human Services, Office of Minority Health. A physician's practical guide to culturally competent care. https://cccm.thinkculturalhealth.hhs.gov

Unless nurses are willing to examine carefully and clarify their own attitudes and values and to be sensitive to others who are "different," their use of cultural concepts when providing care will be unsuccessful. The nurse's role is to understand the patient's needs and to adapt care to respectfully meet those needs. A careful merging of modern and traditional cultural beliefs is a necessary prerequisite for safe, considerate, and successful nursing care of all patients.

National standards issued by the Office of Minority Health (2001) were developed to ensure that all people entering the health care system be provided equitable and effective treatment in a culturally and linguistically appropriate manner. Examples of these standards are provided in Box 5-5. The Office of Minority Health (2016) has now released The National Standards for Culturally and Linguistically Appropriate Services in Health and Health Care.

Theory of Cultural Humility

Foronda (2021) defines **cultural humility** as "the recognition of diversity and power imbalances among individuals, groups or communities, with the action of being open, self-aware, egoless, flexible, exuding respect and supportive interactions, focusing on both self and other to formulate a tailored response. Cultural humility is a process of critical self-reflection and lifelong learning, resulting in mutually positive outcomes" (p. 9). The accompanying "Through the Eyes of a Nurse: I am the Jewish Nurse" which is found on p. 110, is an excellent example of cultural humility. You may also want to check out Foronda's Rainbow Model of Cultural Humility (2020). Foronda (2021) also offers a guide to debriefing for cultural humility created to help learners critically reflect on past events with the lens of better recognizing and understanding diversity and cultural humility.

Box 5-5 **Assuring Cultural Competence in Health Care**

- Ensure that all patients/families receive from all staff members effective, understandable, and respectful care that is provided in a manner compatible with their cultural health beliefs and practices and preferred language.
- Implement strategies to recruit, retain, and promote at all levels of the organization a diverse staff and leadership that are representative of the demographic characteristics of the service area.
- Ensure that staff at all levels and across all disciplines receive ongoing education and training in culturally and linguistically appropriate service delivery.
- Offer and provide language assistance services, including bilingual staff and interpreter services, at no cost to each patient/family with limited English proficiency at all points of contact, in a timely manner during all hours of operation.
- Make available easily understood patient-related materials and post signs in the language of the commonly encountered groups and/or groups represented in the service area.
- Ensure that data on the individual patient's/family's race, ethnicity, and spoken and written language are collected in health records, integrated into the organization's management information systems, and periodically updated.
- Maintain a current demographic, cultural, and epidemiologic profile of the community, as well as a needs assessment, to accurately plan for and implement services that respond to the cultural and linguistic characteristics of the service area.

Source: The Office of Minority Health, Public Health Service, U.S. Department of Health and Human Services. (2001). Assuring cultural competence in health care: Recommendations for national standards and an outcomes-focused research agenda. *Federal Register*, *65*(247), 80865–80879.

Cultural Assessment

The National Center for Cultural Competence urges health care professionals who value cultural competence to enhance their understanding of the following:

- Beliefs, values, traditions, and practices of a culture
- Culturally defined, health-related needs of individuals, families, and communities
- Culturally based belief systems of the etiology of illness and disease and those related to health and healing
- Attitudes toward seeking help from health care providers

When caring for patients from a different culture, it is important to first ask how they want to be treated based on

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

their values and beliefs. An effective way to identify specific factors that influence a patient's behavior is to perform a cultural assessment. The primary informant should be the patient, if possible. If the patient is not able to respond to the questions, a family member or a friend can be consulted. A useful tool for this is the Andrews et al. (2020), part of which is included in Box 5-6. See also the Giger and Davidhizar (2013) and Purnell models for transcultural competence (Figs. 5-2 and 5-3). The Giger and Davidhizar model takes into account six cultural phenomena: communication, space, social orientation, time, environmental control, and biologic variations. The Campinha-Bacote Model of Cultural Competence (2011) emphasizes becoming culturally competent and integrating cultural awareness, cultural knowledge, cultural skill, cultural encounters, and cultural desire.

Box 5-6 Transcultural Assessment: Health-Related Beliefs and Practices

- To what cause(s) does the patient attribute illness and disease (e.g., divine wrath, imbalance in hot/cold or yin/yang, punishment for moral transgressions, hex, soul loss, pathogenic organism)?
- What are the patient's cultural beliefs about the ideal body size and shape? What is the patient's self-image compared to the ideal?
- What name does the patient give to their health-related condition?
- What does the patient believe promotes health (e.g., eating certain foods; wearing amulets to bring good luck; sleep; rest; good nutrition; reducing stress; exercise; prayer; rituals to ancestors, saints, or intermediate deities)?
- What is the patient's religious affiliation (e.g., Judaism, Islam, Pentecostalism, West African voodooism, Seventh-Day Adventism, Catholicism, Mormonism)? How actively involved in the practice of this religion is the patient?
- Does the patient rely on cultural healers (e.g., *curandero*, shaman, spiritualist, priest, minister, monk)? Who determines when the patient is sick and when the patient is healthy? Who influences the choice/type of healer and treatment that should be sought?
- In what types of cultural healing practices does the patient engage (e.g., use of herbal remedies, potions, massage; wearing of talismans, copper bracelets, or charms to discourage evil spirits; healing rituals, incantations, prayers)?
- How are biomedical/scientific health care providers perceived? How do the patient and the patient's family perceive nurses? What are the expectations of nurses and nursing care?
- What comprises appropriate "sick role" behavior? Who determines what symptoms constitute disease/illness? Who decides when the patient is no longer sick? Who cares for the patient at home?
- How does the patient's cultural group view mental disorders? Are there differences in acceptable behaviors for physical versus psychological illnesses?

Source: Adapted from Andrews, M., Boyle, J., & Collins Transcultural Nursing Assessment Guide. (2020). *Transcultural concepts in nursing care* (8th ed.). Wolters Kluwer.

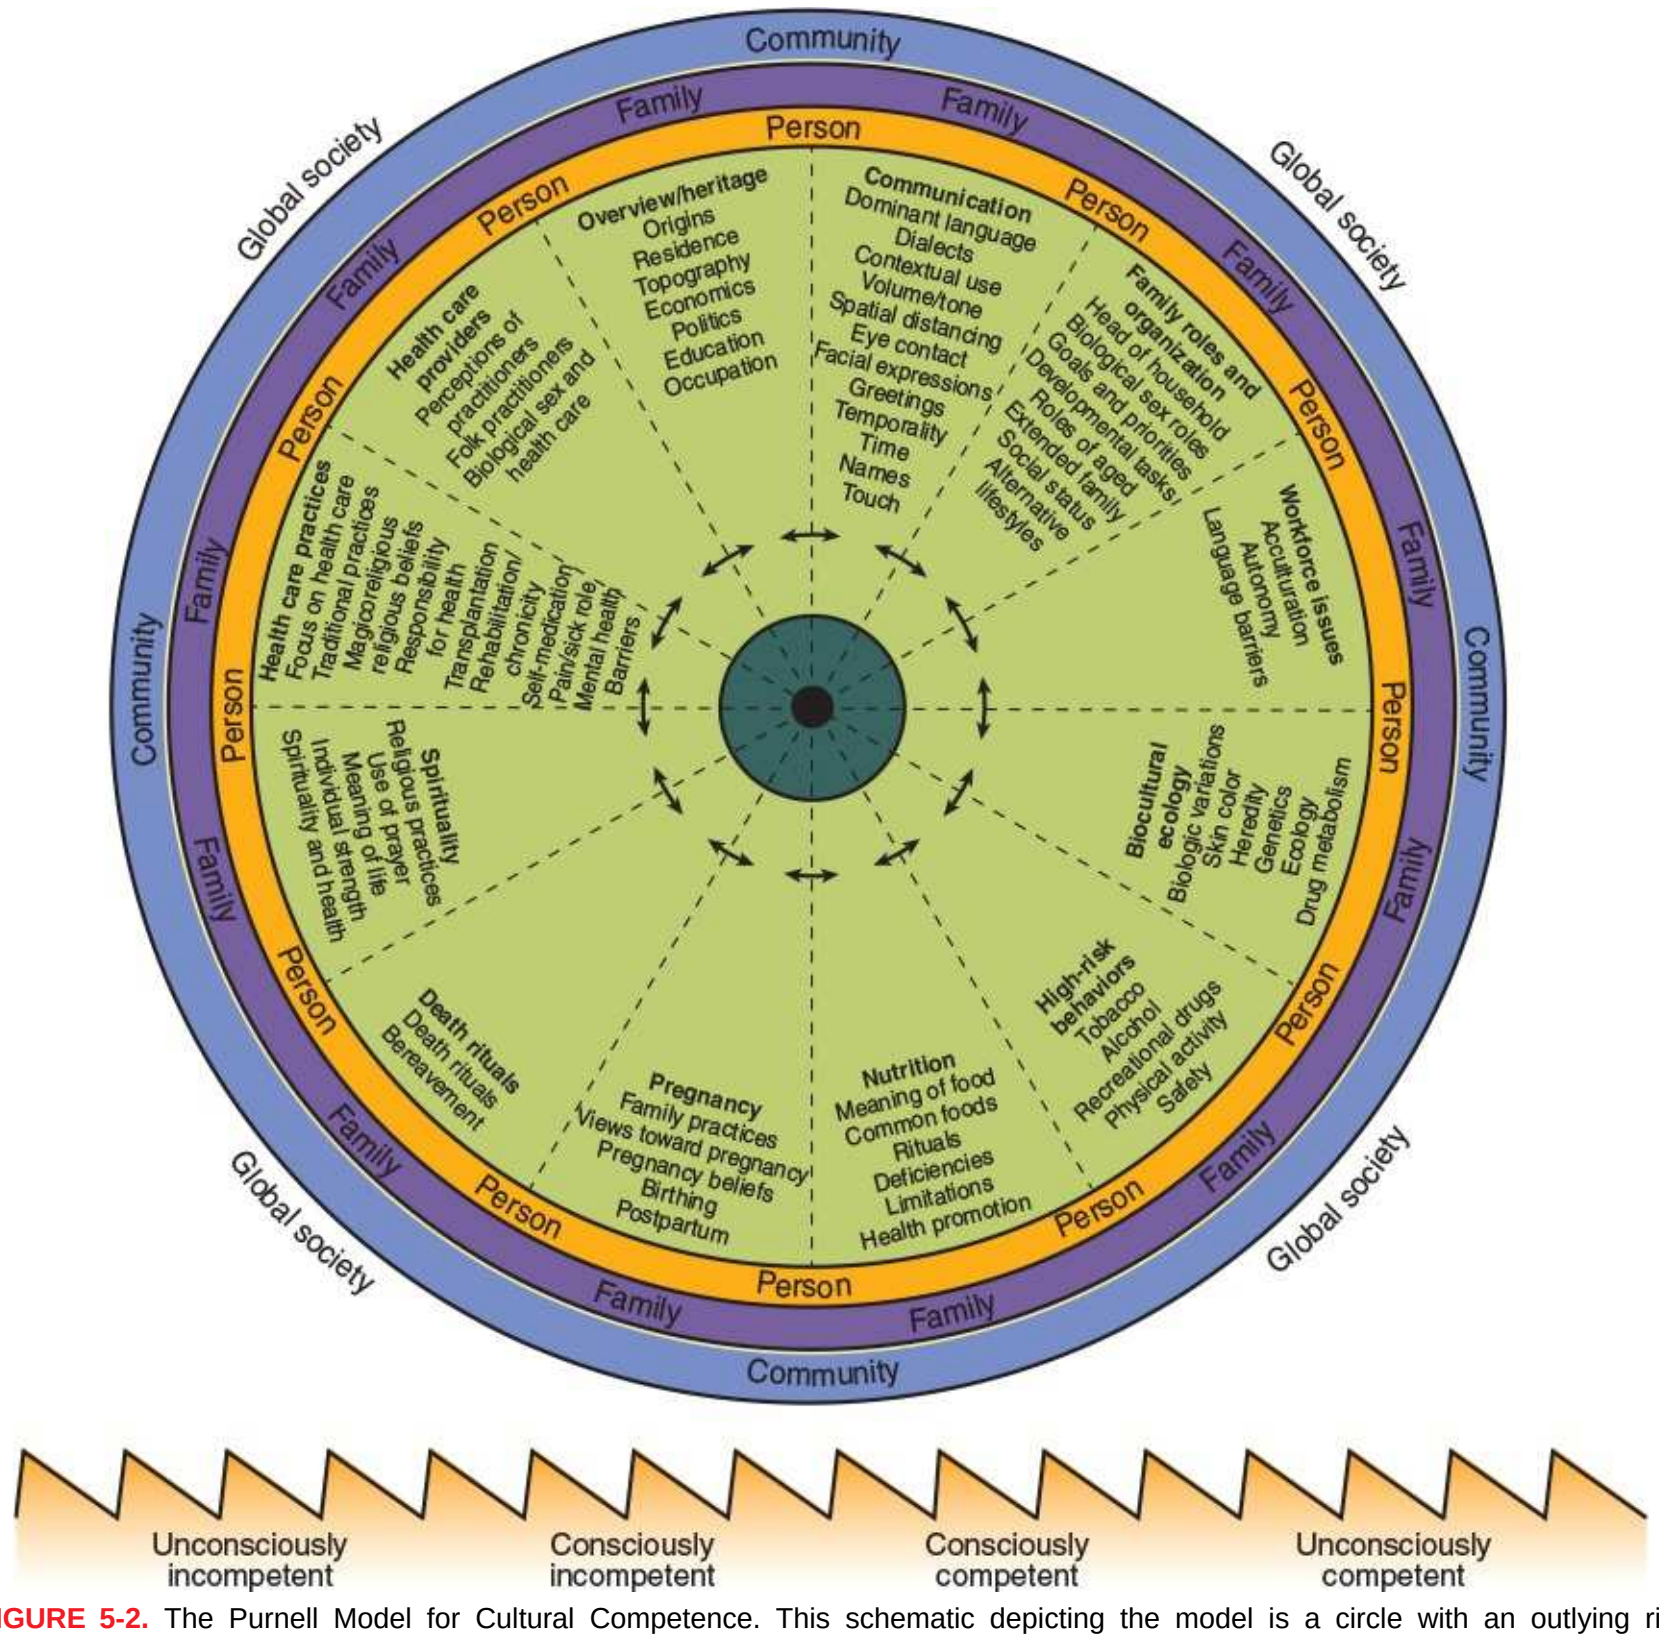

FIGURE 5-2. The Purnell Model for Cultural Competence. This schematic depicting the model is a circle with an outlying rim representing global society, a second rim representing community, a third rim representing family, and an inner rim representing the person. The interior of the concentric circles is divided into 12 pie-shaped wedges depicting cultural domains (constructs) and their concepts. The center of the model is empty, which represents unknown aspects about the cultural group. Along the bottom of the model is a saw-toothed line representing the concept of cultural consciousness. This line relates primarily to the health care provider, although organizations may also be represented on this nonlinear line according to their stage of cultural competence as an organization. (*Source:* Reprinted by permission of SAGE Publications. From Purnell, L. [2002]. The Purnell model for cultural competence. *Journal of Transcultural Nursing*, *13*[3], 193–196; discussion 200–201.)

You can also anticipate a patient's cultural needs by obtaining this information through research before initiating contact with the patient. Remember, however, that *information about any culture is general, and that it must be individualized for the specific patient once the actual interaction begins.*

Guidelines for Nursing Care

Transcultural nursing, now both a specialty and a formal area of practice, originated from work by Dr. Leininger (1991), a nurse–anthropologist. Her Theory of Cultural Care Diversity and Universality provides the foundation for providing culturally respectful care for patients of all ages, as well as families, groups, and communities. A nurse who is culturally respectful has the knowledge and skills to adapt nursing care to cultural similarities and differences. Cultural competence takes time. It involves developing awareness, acquiring knowledge, and practicing skills. Each patient must be considered a unique person. What is true of one person may not be true of another, even if they are from the same cultural background.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

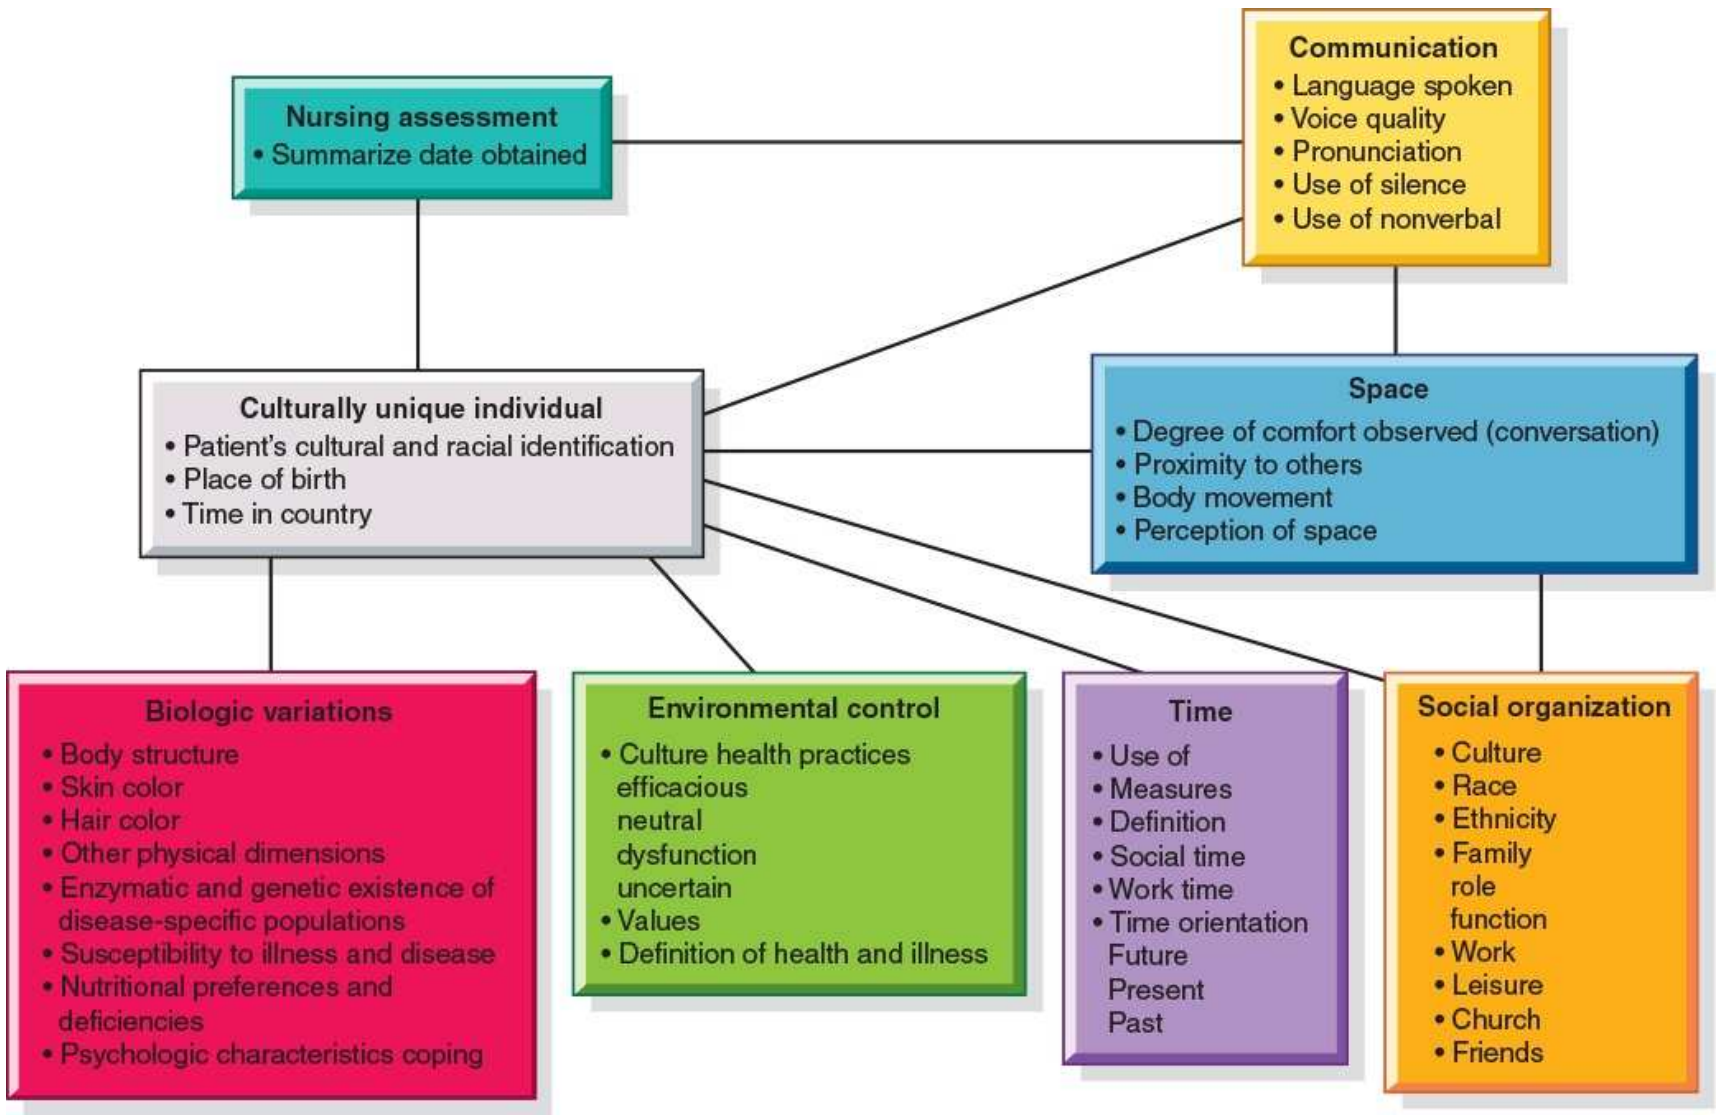

FIGURE 5-3. Schematic of Giger and Davidhizar's Transcultural Assessment Model. (*Source:* From Giger, J. N., & Davidhizar, R. [2013]. *Transcultural nursing: Assessment and intervention* [6th ed., p. 7]. Elsevier/Mosby.)

Concept Mastery Alert

Regardless of the culture background of the patient, nurses need to assess each patient individually to provide culturally respectful care. Asking open-ended questions provides an opportunity to obtain specific information from the patient about their beliefs related to health care.

When providing care to a person from a culture that is different from your own or the dominant culture, you may use past experiences with members of that culture as a guide but never as the answer to all cultural issues. Learn from your mistakes and do not repeat them. All nurses make mistakes at some time when caring for patients from different cultures. Inadvertent mistakes are just that, but repeated mistakes are careless and disrespectful; they will adversely affect your interaction with patients and coworkers. The following sections provide additional guidelines for providing culturally appropriate nursing care.

Develop Cultural Self-Awareness

Before you can provide culturally competent care to patients from diverse backgrounds, you'll need to become aware of the role of cultural influences in your own life. Objectively examine your own beliefs, values, practices, and family experiences. As you become more sensitive to the importance of these factors, you'll also become more sensitive to cultural influences in others' lives. Identify your biases. How do they affect your feelings about others? How could they affect your nursing care of others? For a powerful example of how one nurse transcended possible cultural biases, read the accompanying Through the Eyes of a Nurse on page 110.

Develop Cultural Knowledge

Learn as much as possible about the belief system and practices of people in your community and of patients in the area in which you work. Practice techniques of observation and listening to acquire knowledge of the beliefs and values of patients for whom you provide care. Some people, especially those of minority cultures, may have been belittled or ridiculed and may be hesitant to discuss their beliefs and practices. Approach this topic with patients carefully. If you are motivated by sincerity, respect, and concern, your attitude will convey this, and most patients will respond positively. On the other hand, if you are motivated merely by curiosity and have a condescending attitude, most patients will respond negatively.

Through the Eyes of a Nurse

"I am the Jewish Nurse": RN Who Treated Synagogue Shooter Shares Story

In a country that is no longer shocked by mass murders and random shootings at places that should feel safe, from schools to synagogues to yoga studios, there is one act that has risen out from among the violence that is perhaps the most shocking act of all:

Kindness and Compassion

Ari Mahler, an ER nurse from Pittsburg, was one of three Jewish doctors and nurses who cared for Robert Bowers, the shooter who killed 11 Jewish worshipers and injured 6 at the Tree of Life Congregation on October 27, 2018. After Bowers, who had a long history of anti-Semitism and posted "I'm going in," stormed into the synagogue and began shooting, a police shoot-out occurred, and it's thought that Bowers was shot by officers.

As a result of his wounds, Bower was taken to Allegheny General Hospital to be treated, where he continued his tirade against Jewish people, even reportedly shouting, "Death to Jews" as he was wheeled into the hospital. It was at that moment, when a man so filled with hate that he murdered, that Mahler could have chosen so many paths in his role as a nurse. He could have declined the patient assignment, he could have hurled cruel words back, or he could have taken the patient but failed to care for him properly.

Instead, Mahler chose to rise above hate and instead, cared for Bowers, in his own words, with "empathy."

In a revealing Facebook post, Mahler described how he was the Jewish nurse who cared for one of the country's most hate-filled shooters and how the interaction with Bowers was a deliberate one meant to honor the lives that had been lost, not add to the hate that took them.

"I am The Jewish Nurse," Mahler began his post. "Yes, that Jewish Nurse. The same one that people are talking about in the Pittsburgh shooting that left 11 dead. The trauma nurse in the ER that cared for Robert Bowers who yelled, 'Death to all Jews,' as he was wheeled into the hospital. The Jewish nurse who ran into a room to save his life."

Mahler went on to describe how he was nervous for writing up a post on what happened with Bowers, noting his past growing up Jewish, with a father who was a Rabbi, and experiencing anti-Semitism.

"I found drawings on desks of my family being marched into gas chambers, swastikas drawn on my locker, and notes shoved inside of it saying, 'Die Jew. Love, Hitler.'," Mahler explained. "It was a different time back then, where bullying was not monitored like it is now. I was weak, too. Rather than tell anyone, I hid behind fear. Telling on the people who did this would only lead to consequences far worse."

He then stated that sadly, he was not shocked by the fact that this shooting took place, mentioning today's climate as one that "doesn't foster nurturing, tolerance, or civility … I don't know why people hate us so much, but the underbelly of anti-Semitism seems to be thriving," he added.

"I wanted him to feel compassion. I chose to show him empathy."

And despite the fact that Mahler has been lauded a hero for his care of Bowers, he challenged the public sentiment who praised him because he is Jewish.

"I'm sure he had no idea I was Jewish," he wrote. "Why thank a Jewish nurse, when 15 minutes beforehand, you'd shoot me in the head with no remorse? I didn't say a word to him about my religion. I chose not to say anything to him the entire time. I wanted him to feel compassion. I chose to show him empathy. I felt that the best way to honor his victims was for a Jew to prove him wrong. Besides, if he finds out I'm Jewish, does it really matter? The better question is, what does it mean to you?"

He Didn't See "Evil"

Citing [HIPAA], Mahler also added that he couldn't reveal the specifics of his interaction with Bowers, but did say that when he looked into his eyes, he didn't see "evil," and, like the professional nurse that he is, he didn't base his care for Bowers on who he was or what he had done.

"I can tell you that as his nurse, or anyone's nurse, my care is given through kindness, my actions are measured with empathy, and regardless of the person you may be when you're not in my care, each breath you take is more beautiful than the last when you're lying on my stretcher," he went on to say.

Love

In the comment section of his post, Mahler received an outpouring of love and support for his actions and his care of the mass murderer, including from his fellow Jewish nurses. "As a Jewish nurse I applaud you for doing the right thing," wrote Janet. "It is what we do. We may crumble later but we do our job and do it well."

For those who are wondering just why Mahler acted the way he did and chose to go public with his decision to treat a murderer with any shred of kindness at all, the nurse minced no words in explaining exactly why he did what he did:

"Love," he said. "That's why I did it."

"Love as an action is more powerful than words, and love in the face of evil gives others hope. It demonstrates humanity. It reaffirms why we're all here. The meaning of life is to give meaning to life, and love is the ultimate force that connects all living beings. I [couldn't] care less what Robert Bowers thinks, but you, the person reading this, love

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

is the only message I wish to instill in you. If my actions mean anything, love means everything."

Thoughtful, Person-Centered Practice: Challenging Topics

Respecting Cultural and Religious Beliefs

As students, we quickly learn to respect the cultural and religious beliefs of our patients and their families. While cultural "competence" is an elusive goal, we learn the benefits of cultural humility and respect. That said, our primary commitment to patients entails working with them and their surrogates to identify and choose the treatment goals and plans of care best able to secure their physical health and well-being, which at times, becomes good dying. In the following scenario, the nurse must decide whether to support or challenge the beliefs of the patient's oldest daughter.

Read the scenario and see if you can articulate what you believe, why you believe it, and how these beliefs are likely to inform the decisions you make and your behavior, especially when you are confronted with competing obligations. Based on Tanner's Clinical Judgment Model (2006), consider reflection-in-action and reflection-on-action (Nielson et al., 2007):

Reflection-in-Action

As you read, consider what the nurse is thinking in the moment—what is happening? Why do the patient's two daughters want different things? How should the nurse respond? What is nursing's role?

Scenario

You are caring for a 78-year-old male patient from West Africa who came to the United States to visit his youngest daughter, who is studying at the state university. He is accompanied by his oldest daughter who lives with him in West Africa. His wife is deceased. There are four other sons, all living in West Africa. He presents to the emergency department after 8 days of suffering from fever, chills, nausea, and vomiting. His daughter reports that he's been unable to hold fluids. A computed tomography (CT) scan of the abdomen shows a small bowel obstruction with a dilated bowel. He has a history of other comorbidities (hypertension, type 2 diabetes, and kidney disease stage III). Deemed not to be a good candidate for surgery, he is in the intensive care unit with multiorgan failure. He is now unresponsive with a worsening prognosis. Both daughters are acting as his spokesperson. The critical care intensivist believes it is time to transition to purely palliative goals and to stop the "life-sustaining" interventions that now seem to be "death-prolonging." His oldest daughter is horrified and insists that we do not stop any treatments. She is denying his condition and bleak prospects. She explains that the family's role in their culture is to try everything or "he will know that we didn't do all we could and he will follow us after death." She continues, "It is important to live a fulfilling life and to die of natural causes. The goal of life is to become an ancestor after death. After death, an individual lives in a spirit world, receiving a new body that is identical to the earthly body, with the capacity to move about as an ancestor. Having life cut short through an accident or by an unnatural death may prevent this from occurring."

Effective Noticing (Cues)

1. What did you notice about the situation initially? What information/observations are significant? What information deviates from what is expected/normal/usual?

Effective Interpreting

2. How would you prioritize this data? What other assessment data, evidence, and/or information would you need to consider the situation? How would you obtain this additional information?
3. What do you think about this situation? Consider personal and previous nursing experiences that you have had and formal knowledge (physiology, psychology, communication skills) that may be of assistance in providing care in this situation.
4. Once the nurse finds herself caught in the three-way dilemma of respecting the family's culture, helping the family help the patient die well, and supporting the recommendation of the critical care intensivist, she is less certain of how to proceed because she has never been in a situation like this before. What sort of "fact finding" would you recommend and what resources can you tap? How could you best learn what you need to know about this family's culture? Are there hospital policies or other resources you can consult?
5. Now see if you can articulate what you believe, why you believe this, and how these beliefs are likely to inform the decisions you make and your behavior, especially when you are confronted with competing obligations.

Effective Responding

6. How would you describe and prioritize the obligations you have in this scenario to advocate for your patient being allowed to die well—which, in the team's analysis, means transitioning to purely palliative goals, versus your obligation to respect this family's cultural beliefs and continue to do everything medically possible?
7. If you cannot fulfill each of these obligations, how will you prioritize them? What basis/rationale do you use for prioritization? What counsel does the ANA *Code of Ethics for Nurses* offer?
8. If you want to learn more about West African culture, what resources would you use? If you want to educate the oldest daughter about how end-of-life decisions are made in the United States, what resources would you use?

Scenario

The patient's youngest daughter, who has been living in the United States for 2 years, understands the advice the critical care team is offering and is willing to change the treatment goals to prepare her father for a comfortable and dignified death. The nurse decides it is important to support this daughter while trying to be respectful of the older daughter's wishes.

Effective Reflecting

9. Which statement below best captures your beliefs?
    a. Respecting the patient's culture trumps imposing our U.S. medical culture—even when this is oriented to securing a respectful and peaceful death for the patient.
    b. Helping this patient die well is more important than respecting the family's culture. Think Maslow's hierarchy.
10. Do you agree with the choice the nurse made? Would you have made the same choice? Why or why not? What would inform your decision?
11. Whether you decide to advocate for the critical care intensivist or the oldest daughter—both of whom want to do right for the patient—how might you use reflective practice to evaluate your decision so you can respond more confidently in similar situations in the future? What criteria will you use to evaluate a good response?
12. What personal attributes and competencies are most likely to lead to a good response?

Reflection-on-Action

Then look back at the nurse's decisions and reflect on your learning—how did your knowledge and/or skills expand based on this scenario? What attitude, value, or belief shifts did you experience (if any) after reading this scenario? What would you do differently if you were in this situation? What more do you need to know to be able to manage this or a similar situation in the future?

Accommodate Cultural Practices in Health Care

Incorporate factors from the patient's cultural background into health care whenever possible if the practices would not be harmful to the patient's health. To ignore or contradict the patient's background may result in the patient refusing care or failing to follow prescribed therapy. Modify care to include traditional practices and practitioners as much as possible, and be an advocate for patients from diverse cultural groups.

Accommodate the cultural dietary practices of patients as much as possible. Dietary departments in many hospitals and long-term care facilities can provide meals that are consistent with special dietary practices. Families may be encouraged to bring food from home for patients with particular preferences when this practice does not violate policy. Teaching patients and families about therapeutic diets may also be appropriate within the framework of particular cultural practices.

Respect Culturally Based Family Roles

Consider the cultural role of the family member who makes most of the important decisions. In some cultures, it is the husband or father, whereas in others it may be a grandmother or another respected elder. To disregard this person's role or to proceed with nursing care that is not approved by this person can result in conflict or in disregard for the patient's and family's values. Be careful to involve this person in the nursing care planning. See the accompanying Challenging Topics (on pages 111–112) feature to read about the struggles of one family to make decisions that honored their father.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Avoid Mandating Change

Keep in mind that health practices are part of the overall culture and that changing them may have widespread implications for the person. Provide support and reinforcement for the patient if it is necessary to change a health practice with a cultural basis.

Do not force patients to participate in care that conflicts with their values. If a patient is forced to accept such care, resulting feelings of guilt and alienation from a religious or cultural group are likely to threaten that patient's well-being.

Seek Cultural Assistance

Seek assistance from a respected family member, member of the clergy, or traditional healer, as appropriate, so that the patient is more likely to accept health care services. Acknowledging the role of the person's traditional healer can be an important way of building trust. Folk medicine practitioners can work closely with professional health practitioners in the interest of the patient and family. Such efforts promote mutual understanding, respect, and cooperation.

DEVELOPING CLINICAL REASONING AND CLINICAL JUDGMENT

. Analyze the following situations, identifying potential sources of cultural imposition:

- A young Ethiopian woman with terminal breast cancer requests that her uncle, who is the family elder, make all treatment decisions. Her primary nurse is an active feminist.
- A Native American woman refuses a life-saving amputation of her leg because she believes it is essential to enter the next world "whole." Her attending believes she is being foolish because he can "save her life."

. Interview family members or friends who have recently received health care, such as for a health screening, diagnostic testing, emergency care, routine checkup, office or clinic visit, or hospitalization. What aspects of the health care culture were most distressing to them? What factors were most helpful? Do their answers vary according to the setting for care or the attitudes of the health care providers involved? If so, why do you think they felt as they did?

. College students have their own culture. What in your school's culture is influencing your health positively and negatively? If you don't want to be the passive recipient of negative cultural forces, what choices do you have?

. Visit the Georgetown University National Center for Cultural Competence website (http://nccc.georgetown.edu). Pay special attention to the self-assessment resources. Share with your classmates what you learned about your own cultural competence/humility.

. On a given evening while you are doing a clinical rotation in a busy emergency department you meet the following patients: A "drunk driver" who killed a mother and her twin sons in another car; a man with chronic back pain whom the experienced staff characterize as "drug-seeking"; a 79-year-old man transferred from a nursing home, who fell in the bathroom and broke his hip; and a person who is homeless and is reporting stomach pain. Are you aware of any *personal* biases that might interfere with these patients receiving your best care? What *institutional* biases might contribute to their receiving less optimal care?

. When we think about culture we often jump quickly to religious or ethnic cultures. How might belonging to a university football or lacrosse team influence a student's health and well-being?

PRACTICING FOR NCLEX

. A nurse is caring for patients of diverse cultures in a community health clinic. Which concepts will the nurse incorporate to guide the plan of care? Select all that apply.

a. The United States has become less inclusive of same-sex couples.
b. Cultural diversity is limited to people of varying cultures and races.
c. Cultural diversity is separate and distinct from health and illness.
d. People may be members of multiple cultural groups at one time.
e. Culture guides what is acceptable behavior for people in a specific group.
f. Cultural practices may evolve over time but mainly remain constant.

. At the last staff meeting, the nurse manager discussed the organizational initiative to improve provision of culturally competent care. During rounds, which behaviors inconsistent with this goal require the manager to intervene? Select all that apply.

a. A staff nurse tells the AP that patients should not be given a choice, but should shower or bathe daily.
b. A nurse asks the family of a patient who has died if they would like to wash their loved one's body.
c. A nurse tells another nurse that Jewish dietary restrictions are just a way for them to get special foods.
d. A Catholic nurse insists that a patient diagnosed with terminal bladder cancer see the chaplain in residence.
e. A nurse obtains a translator to speak to the patient in their native language.
f. A nurse refuses to care for a married gay patient who is HIV positive because the nurse is against same-sex marriage.

. An ambulatory care nurse serving a large, culturally diverse population is planning a free blood pressure screening

clinic. Based on the nurse's understanding of racial differences in health and illness, which groups will the nurse target for screening? Select all that apply.

a. Native American people
b. African American people
c. Alaska Native people
d. Asian people
e. White people
f. Hispanic people

. A nurse is using the Explanatory Model of Health and Illness (ESFT) model to assess how a patient from another culture views their diagnosis of chronic obstructive pulmonary disease (COPD). What interview question is most appropriate to assess the E aspect of this model?

a. How do you get your medications?
b. How does having COPD affect your lifestyle?
c. Are you concerned about the side effects of your medications?
d. Can you describe how you will take your medications?

. A nurse tells a patient, "tonight's menu selection is pork. I understand many people in your culture do not eat pork; may I order something else for you?" When the patient states they no longer observe this dietary practice, the nurse understands that the patient has experienced what transition?

a. Cultural assimilation
b. Cultural imposition
c. Culture shock
d. Ethnocentrism

. The charge nurse overhears a nurse state, "That patient is 78 years old—too old to learn how to change a dressing." How should the charge nurse respond?

a. "Please don't impose your view of the patient's culture on them."
b. "I wish you would try to demonstrate more cultural sensitivity."
c. "Try to be open to your patient's culture, to make the biggest impact."
d. "Grouping all older adults as having trouble learning is a form of stereotyping."

. A young Hispanic mother comes to the local clinic because her baby is sick. She speaks only Spanish, and the nurse speaks only English. Which action should the nurse take next?

a. Use short words and speak loudly
b. Obtain a medical interpreter
c. Explain why care cannot be provided
d. Provide instructions in writing

. A nurse is interviewing a newly admitted patient from another culture. What question best displays cultural sensitivity?

a. "Do you think you'll be able to eat the food we have here?"
b. "You do understand that we can't prepare special meals?"
c. "What types of food do you typically prepare for meals?"
d. "Could you make an exception on what food you eat while you are here?"

. A nurse tells a new mother from Africa that she should not carry her infant in a sling because bassinets are safer. The charge nurse suggests the nurse is displaying which behavior?

a. Cultural imposition
b. Clustering
c. Cultural competency
d. Stereotyping

. A community organization includes provision of culturally competent care in their mission. Which action has the organization set as a priority?

a. Learning the predominant language of the community
b. Obtaining significant information about the community
c. Treating each patient at the clinic as an individual
d. Recognizing the importance of the patient's family

. A surgeon will not attempt a life-saving repair of a ruptured aneurysm unless the patient agrees to receive blood

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

transfusions. Although receiving blood products is against the patient's religious beliefs, the surgeon ordered four units of packed red blood cells. What action will the nurse take first?

a. Administer the blood transfusion
b. Call the patient's family and ask them to reason with the patient
c. Discuss obtaining a court order to save the patient's life
d. Maintain the patient's comfort and support their decision

ANSWERS WITH RATIONALES

. **d, e, f.** A person may belong to multiple cultural, ethnic, and racial groups at one time. Culture guides what is acceptable behavior for people in a specific group. Cultural practices and beliefs may evolve over time, mainly remaining constant as long as they satisfy a group's needs. The United States has become more inclusive of same-sex couples. The definition of cultural diversity includes, but is not limited to, people of varying cultures, racial and ethnic origin, religion, language, physical size, biologic sex, sexual orientation, age, disability, socioeconomic status, occupational status, and geographic location. Cultural diversity, an integral component of health and illness, includes culture, ethnicity, and race.

. **a, d.** Cultural imposition occurs when someone believes others should conform to their beliefs, such as whether or not to shower or bathe daily, when a Catholic nurse insists that a terminally ill patient see a chaplain. Cultural blindness occurs when a nurse treats all patients the same regardless of culture. Culture conflict occurs when a nurse judges a patient's dietary restrictions as a way to get their favorite foods. When a nurse refuses to respect an older adult's ability to speak for themselves, or refuses to treat a patient based on their sexual orientation, stereotyping has occurred.

. **b, c, e.** African American people, Asian people, and White people are more prone to developing hypertension. Alaska Native individuals and Native American individuals are prone to heart disease, diabetes, cirrhosis, and fetal alcohol syndrome.

. **b.** The ESFT model, a cross-cultural communication tool, guides providers in understanding a patient's explanatory model (a patient's conception of their illness), social and environmental factors, and fears and concerns and also guides providers in contracting for therapeutic approaches. Asking the questions: "How does having COPD affect your lifestyle?" explores the explanatory model, "How do you get your medications?" refers to the social and environmental factor, "Are you concerned about the side effects of your medications?" addresses fears and concerns, and "Can you describe how you will take your medications?" involves therapeutic contracting.

. **a.** Assimilation occurs when minority groups living within a dominant group lose the cultural characteristics that make them different. Cultural imposition occurs when one person believes that everyone should conform to their own belief system. Culture shock occurs when a person is placed in a different culture perceived as strange, and ethnocentrism is the belief that the ideas, beliefs, and practices of one's own cultural group are best, superior, or most preferred to those of other groups.

. **d.** Stereotyping is assuming that all members of a group are alike. This is not an example of cultural competence nor is the nurse imposing her culture on the patient. The information in this scenario does not suggest the nurse is not open to her patient's culture.

. **b.** Requesting an interpreter reflects best practice. Qualified interpreters, available in many facilities or via video or phone, have knowledge of health care and can provide assistance. Using short words, talking loudly, and providing instructions in writing will not aid communication. Explaining why care cannot be provided will not meet the patient's health needs; the nurse is required to provide care. Since the patient doesn't speak English, this will not be understood.

. **c.** Asking patients what types of foods they eat for meals is culturally sensitive. The other questions are culturally insensitive.

. **a.** The nurse is trying to impose her belief that bassinets are preferable to baby slings on the African mother—in spite of the fact that African women have safely carried babies in these slings for years.

. **c.** In all aspects of nursing, patients should be treated as individuals; this remains true when providing culturally competent care. Additional ways to provide culturally competent care include learning the predominant language in the community, researching the patient's culture, and recognizing the influence of family on the patient's life.

. **d.** The nurse does not force patients to participate in care that conflicts with their values. Imposing such care may engender feelings of guilt and alienation from a religious or cultural group and create a threat to the patient's well-being.

6

Values, Ethics, and Advocacy

Chengyu Zhang

Chengyu is an alert 32-year-old man in the intensive care unit who is begging to be removed from the ventilator. He understands that it is highly unlikely that he will be able to breathe on his own without the ventilator. He writes on the communication board, “If I die, I die. I can’t keep living like this.”

Marissa Sandoval

Marissa, a 44-year-old woman who has just recently undergone extensive surgery to treat uterine cancer, is experiencing several serious postoperative complications. She states, “I don’t know why all of these things are happening. I ask the doctors. So does my family. But we get no answers. We just want to know what is happening.” The nurse is surprised to observe that the oncology nurse practitioner not only does not answer Marissa’s questions but also dismisses her fears without any explanation.

William Raines

Mr. Raines, a 68-year-old man experiencing homelessness, is diagnosed with schizophrenia,

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

developmental delays, and uncontrolled hypertension. He was admitted for control of moderately severe elevated blood pressure. A review of his medical record reveals that Mr. Raines was getting samples of medications for blood pressure treatment from the pharmaceutical representatives at the clinic, but recent policy changes stopped this practice approximately 4 weeks ago. Mr. Raines is about to be discharged with several prescriptions for medications but no way to fill them.

Learning Outcomes

After completing the chapter, you will be able to accomplish the following:

. List five common modes of value transmission.
. Describe three steps in the valuing process.
. Use values clarification strategies in clinical practice.
. Compare and contrast the principle-based and care-based approaches to bioethics.
. Describe nursing practice that is consistent with the code of ethics for nursing.
. Describe moral distress and ways to promote moral resilience.
. Recognize ethical issues as they arise in nursing practice.
. Use an ethical framework and decision-making process to resolve ethical problems.
. Identify four functions of institutional ethics committees.
. Describe three typical concerns of the nurse advocate.

moral resilience
morals
nonmaleficence
nursing ethics
principle-based approach
value system
values
values clarification
virtues

The unique nature of nursing places nurses both at the bedside and in groups of professionals where critical decisions are made about the best way to treat injury and disease and to solve health care problems. Often, the question confronting the nurse is not "How do I do this?" but, rather, "Should I do this?" or even, "How can we *not* do this?" The more that science and technology increase the options available to patients and health care professionals, the more frequently nurses will find themselves asking "We can do this, but should we, here and now, for this patient?" An example of this would be: "Should the professionals in the intensive care unit keep Mr. Zhang on ventilatory support?"

Nurses also are increasingly distressed by the failure of society to provide adequate care for its most vulnerable members. Nothing is more disturbing for professional nurses than seeing firsthand the consequences of unmet health care needs (Olsen & Keilman, 2020). When nurses care for patients like Mr. Raines, who lack the financial resources to obtain the medications and treatment they need, they have special advocacy obligations. A shortage of nurses further complicates the nursing work environment, creating the necessity for nurses to be skilled advocates for safety and quality care as well as for their own needs. Never has it been more important for nurses to grasp the ethical dimensions of professional practice and to be confident in "doing the ethically right thing simply because it's the right thing to do!" With their moral integrity on the line every day, nurses understand the need to be as skilled ethically as they are intellectually, interpersonally, and technically. Nurses who understand how patients' values and their own values shape nurse–patient interactions, and who continually develop sensitivity to the ethical dimensions of nursing practice, are best able to provide thoughtful, person-centered quality care and advocate effectively for their patients. For an example, see the accompanying display, Reflective Practice: Challenge to Ethical and Legal Skills (on page 118) that includes self-reflective questions.

VALUES

Values are beliefs about the worth of something, about what matters, that act as a standard to guide one's behavior. If you think back to how you spent your last weekend, you may observe something about your own values. The amount of time, passion, and money you devote to relationships, work, study, fitness activities, leisure, and other experiences reveals something about the importance (value) you attach to these endeavors. As nurses, we need to routinely monitor whether our values support excellent practice.

A **value system** is an organization of values in which each is ranked along a continuum of importance, often leading to a personal code of conduct. A person's values influence beliefs about human needs, health, and illness; the practice of health behaviors; and human responses to illness. For example, people who place a high value on health and personal responsibility often work hard to reach their fitness goals. People who value high-risk leisure activities may attach less value to life and health. Nurses who work effectively with patients are sensitive to how a patient's values and their own values influence their interactions. How might you use values to analyze people's very different approaches to using measures like handwashing, social distancing, and mask wearing to reduce the transmission of COVID-19 during the pandemic? Similarly, what values prompted many to eagerly find a way to get vaccinated once the vaccines were available when others chose not to be vaccinated?

Development of Values

A person is not born with values; rather, values are formed during a lifetime involving influences from the environment, family, and culture.

Recall **Chengyu Zhang**, the 32-year-old man in the intensive care unit asking to be removed from the ventilator, even if it means that he will die. The nurse can integrate knowledge of the patient's culture and family and their influence on the patient's value of independence as a key aspect in planning his care.

As children observe the actions of their parents and siblings, they quickly learn what has high and low value for family members. If the parents spend a good portion of each day cooking, for example, and the family spends a long time eating and talking at the table, the children learn to value food and the good times it represents. Similarly, children learn that helpfulness is a good and respected quality if praised when helping parents, grandparents, and siblings. Common modes of value transmission include modeling, moralizing, laissez-faire, rewarding and punishing, and responsible choice.

QSEN Reflective Practice: Cultivating QSEN Competencies

CHALLENGE TO ETHICAL AND LEGAL SKILLS

I have faced a common ethical dilemma both as a student in the clinical area and as a summer nurse extern. My lack of confidence prevents me from being a patient advocate. My lack of status in the unit makes it very difficult for me to stand up to more senior, experienced staff to act as a patient advocate. However, patient advocacy is a crucial duty for any nurse. I feel that when I neglect this duty, I am being unethical because I am not fulfilling one of the most important nursing roles. An example of this dilemma occurred during one of my first weeks on the gynecologic surgical floor, where I was an extern this summer.

Mrs. Marissa Sandoval was a 44-year-old woman who had just recently undergone extensive surgery for treatment of newly diagnosed uterine cancer. She also developed several postoperative complications. Mrs. Sandoval and her family were unhappy about the lack of answers they were getting from the attending surgeon and her oncology nurse practitioner about the complications she was experiencing from the surgery. After observing the nurse practitioner interacting with the patient and her family in her room, I could easily understand the patient's distress. In addition to not answering any of the family's questions, he dismissed all of her legitimate fears without an explanation. I felt this was a terrible way to treat a patient and that as patient advocate, I had an ethical and professional duty to make sure the patient and her family received adequate answers.

Thinking Outside the Box: Possible Courses of Action

- Confront the nurse practitioner, explaining the patient's anxiety and asking him to return to her room to answer the questions.
- Try to answer the patient's questions to the best of my ability.
- Pretend that the nurse practitioner was acting appropriately. Tell the patient that he will return tomorrow during rounds, and that she will have the opportunity to ask questions then.
- Ask another, more experienced nurse to answer my patient's questions.
- Tell the patient not to worry so much because the doctors and nurses will take good care of her.

Evaluating a Good Outcome: How Do I Define Success?

- The patient receives satisfactory answers to her questions.
- The situation is handled in a respectful manner for all parties involved.
- The American Nurses Association (ANA)'s Bill of Rights for Registered Nurses is followed: "Nurses have the right to freely and openly advocate for themselves and their patients, without fear of retribution."
- No one involved in the situation suffers from a violation of integrity.
- The ANA Code of Ethics is followed: "The nurse promotes, advocates for, and strives to protect the health, safety, and rights of the patient."

Personal Learning: Here's to the Future!

In retrospect, when I examine the situation, I don't think that I handled the situation in the most ethical manner. Rather than dealing with the situation myself, I sought out the help of a more experienced nurse to answer the patient's questions to the best of her ability. Unfortunately, because of the complexity of the case, the more experienced nurse was not able to answer all of the questions adequately. I should have spoken with the surgeon and oncology nurse practitioner and expressed my concern regarding the patient's questions going unanswered. However, I was greatly intimidated by this surgeon and nurse practitioner, and I did not want to confront them. My actions demonstrate that I was compromising my role as a patient advocate. I compromised this role because of personal anxiety and lack of confidence associated with confronting other members of the team.

I am trying to base my personal practice on a strong ethical foundation, and act accordingly, as I hold my own actions to a high ethical standard. However, I am not a very confrontational person. This, coupled with my great insecurities about working in the hospital, makes it difficult for me to confront other health care providers when I think they are acting in an unethical manner. Therefore, while I think my personal actions have a strong ethical foundation, I have a lot of room for growth when acting ethically to confront coworkers. I hope that as I grow more comfortable in the hospital, I will not compromise my role as a patient advocate because of my personal fears.

Elizabeth Nalli, Georgetown University

QSEN SELF-REFLECTION ON QUALITY AND SAFETY COMPETENCIES DEVELOPING KNOWLEDGE, SKILLS, AND ATTITUDES FOR CONTINUOUS IMPROVEMENT

How do you think you would respond in a similar situation? Why? What does this tell you about yourself and about the adequacy of your values and skills for professional practice? How was the nursing student's action ethical? Legal? Please explain. What other *knowledge, attitudes,* and *skills* do you need to develop to continuously improve the quality and safety of care for patients like Mrs. Sandoval?

Patient-Centered Care: What role did each member of the nursing team play in creating a partnership with Mrs. Sandoval to best coordinate her care? What special talents would you bring to this partnership?

Teamwork and Collaboration/Quality Improvement: What communication skills do you need to improve to ensure that you function as a competent, caring, and responsible member of the patient-care team and that you obtain assistance when needed? How would you have responded if experienced nurses, nursing leadership, and the patient's surgeon and nurse practitioner were not responsive to your concerns? What special talents would you bring to promoting a well-functioning interdisciplinary team?

Safety/Evidence-Based Practice: What priority did everyone involved in Mrs. Sandoval's care accord to her health, well-being, and safety? What evidence in the nursing literature supports practicing within the scope of practice and roles?

Informatics: Can you identify the essential information that must be available in Mrs. Sandoval's electronic record to support safe patient care and coordination of care? Can you think of other ways to respond to or approach the situation?

Through *modeling,* children learn what is of high or low value by observing parents, peers, and significant others. Thus, modeling may lead to socially acceptable or unacceptable behaviors. Children whose caregivers use the *moralizing* mode of value transmission are taught a complete value system by parents or an institution (e.g., church or school) that allows little opportunity for them to weigh different values.

Those who use the *laissez-faire* approach to value transmission leave children to explore values on their own (no single set of values is presented as best for all) and to develop a personal value system. This approach often involves little or no guidance and may lead to confusion and conflict.

Through *rewards* and *punishments,* children are rewarded for demonstrating values held by parents and punished for demonstrating unacceptable values. Finally, caregivers who follow the *responsible choice* mode of value transmission encourage children to explore competing values and to weigh their consequences. Support and guidance are offered as children develop a personal value system.

Reflect for a moment on values you hold and see if you can identify how you developed these values. Will your values serve your patients well?

Values Essential to the Professional Nurse

Professional values provide the foundation for nursing practice and guide the nurse's interactions with patients, colleagues, and the public. In 1998, the American Association of Colleges of Nursing (AACN) identified five values that epitomize the caring professional nurse. Table 6-1 (on page 120) lists these values and sample behaviors illustrating each of them. See also the revised *Essentials* (AACN, 2021) for a description of the domains for nursing. Person-centered care is described as holistic, individualized, just, respectful, compassionate, coordinated, evidence-based, and developmentally appropriate (p. 11).

What other values epitomize the thoughtful, caring professional nurse? Every nurse should critically examine their personal values to see if they match these essential professional values. For example, if you value self-promotion to the extent that you won't make the sacrifices demanded by a genuine commitment to the welfare of the patients entrusted to your care, you will never be successful as a nurse. Similarly, if you attach low value to respecting people who are different from you, you may interact with patients and colleagues in a way that is demeaning and unprofessional. It is helpful to identify nurses in your practice setting who epitomize nursing's essential values and to learn from observing their behavior. It is never too late to develop the values that epitomize the caring professional nurse. Ask yourself now how you would respond if you saw an experienced nurse or health care provider in your clinical rotation acting in a way that was harmful to patients. Would you intervene? What if it was as simple as someone not washing hands before a clinical encounter? What if a nurse instructing you contaminated a urinary catheter before getting ready to insert it?

To encourage health care professionals to respect and accept the individuality of patients, some educators have advised that professionals be "value neutral" and "nonjudgmental" in their professional roles. Professional nurses do not assume that their personal values are more correct than those of their patients. This encourages effective care for patients with values different from the nurse's. For example, a nurse who strongly believes that any premarital or extramarital

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

sex is wrong can still offer competent and compassionate nursing care to a young sex worker with active herpes lesions. On the other hand, when it comes to health, safety, and well-being, nurses do make judgments. If the same patient, after receiving education, indicates that they are unconcerned about whom they might infect in future sexual encounters, the nurse has an ethical obligation to try to protect the patient and others from the harm the patient's values may cause.

In August 2014, 50 nursing leaders came together in Baltimore, Maryland, for a summit meeting on nursing ethics in the 21st century. The goals of the summit were to "identify the strategic nursing ethics priorities for the profession and create a blueprint for the future that key individuals and professional organizations will adopt and implement to build capacity within nursing; create and support ethically principled, healthy, sustainable work environments; and contribute to the best possible patient, family and community outcomes" (http://www.bioethicsinstitute.org/nursing-ethics-summit-report). Nurses participating in the summit made promises to carry on this work—to themselves, to each other, and to the profession. It is interesting to read the promises nurses continue to make on the summit's website when they sign the pledge.

Table 6-1 Professional Values

PROFESSIONAL VALUES	SAMPLE PROFESSIONAL BEHAVIORS	SELF-REFLECTION
Altruism Altruism is a concern for the welfare and well-being of others. In professional practice, altruism is reflected by the nurse's concern for the welfare of patients, other nurses, and other health care providers.	• Demonstrating understanding of the cultures, beliefs, and perspectives of others • Advocating for patients, particularly the most vulnerable • Taking risks on behalf of patients and colleagues • Mentoring other professionals	• Am I willing to move out of my comfort zone to advocate for my patients? • Would my instructor and classmates say that "my primary commitment is to my patient(s)?"
Autonomy Autonomy is the right to self-determination. Professional practice reflects autonomy when the nurse respects patients' rights to make decisions about their health care.	• Honoring the right of patients and families to make decisions about health care • Planning care in partnership with patients • Providing information so that patients can make informed choices	• Do I routinely find the time to provide the information and support patients need to make truly autonomous decisions to advance their well-being and interests?
Human Dignity Human dignity is respect for the inherent worth and uniqueness of individuals and populations. In professional practice, human dignity is reflected when the nurse values and respects all patients and colleagues.	• Providing culturally respectful and sensitive care • Protecting the patient's privacy • Preserving the confidentiality of patients and health care providers • Designing care in partnership with the patient and with sensitivity to individual patient needs	• Do I demonstrate the same respect and compassion for *every* human I meet—even when this is challenging? • Am I willing to "go the extra mile" for each and every patient?
Integrity Integrity is acting in accordance with an appropriate code of ethics and accepted standards of practice. Integrity is reflected in professional practice when the nurse is honest and provides care based on an ethical framework that is accepted within the profession.	• Providing honest information to patients and the public • Documenting care accurately and honestly • Seeking to remedy errors made by self or others • Demonstrating accountability for own actions	• At the end of the day, can I lay my head on my pillow and feel peaceful and fall asleep because I lived the day according to my values and ethics.

Social Justice Social justice is upholding moral, legal, and humanistic principles. This value is reflected in professional practice when the nurse works to assure equal treatment under the law and equal access to quality health care.	• Supporting fairness and nondiscrimination in the delivery of care • Promoting universal access to health care • Encouraging legislation and policy consistent with the advancement of nursing care and health care	• Am I acutely aware when people are not being treated fairly, when they lack access to quality care? Does my awareness lead to advocacy? Do I share professional nursing's commitment to securing access to affordable quality care for *all* ?

Values Clarification

Values clarification is a process by which people come to understand their own values and value system. It is a process of discovery, allowing the person to discover through feelings and analysis of behavior what choices to make when alternatives are presented. Values clarification is beneficial for nurses. When nurses understand the values that motivate patients' decisions and behaviors, they can tap these values when teaching and counseling patients. For example, a man who does not value his own health and well-being may be motivated by the value he attaches to being a good father for his children to make needed lifestyle changes.

Values theorists most often describe the process of valuing as focusing on three main activities (Raths et al., 1978):

. Choosing
. Prizing (treasuring)
. Acting

When you decide to value something, you choose freely from alternatives after careful consideration of the consequences of each alternative. Prizing something you value involves pride, happiness, and public affirmation. Finally, the person who values something acts on the value by combining choice and behavior with consistency and regularity.

Example of Values Clarification by the Nurse

If you value inherent human dignity in your nursing practice, you choose freely to believe in the worth and uniqueness of each person, to realize that you have other options (e.g., you could treat with dignity only those people who are most like you), and to believe that respecting each person's human dignity yields the best consequences for you and for all of society.

You also will prize your choice. For example, you especially enjoy when patients let you know they appreciate your care and when nursing colleagues and supervisors compliment you on interpersonal skills. You also prize your ability to defend this value when someone's human dignity is being ignored.

Clarifying this value of respect for human dignity will motivate you to incorporate this value into your practice. You strive to respect human dignity consistently in your personal as well as professional life.

As you become more conscious of this value, you will be sensitive to actions that are inconsistent with it. For example, you may feel uncomfortable hearing other nurses gossiping during break about a patient they do not like, realizing that this behavior contradicts a basic respect for human dignity.

Clinical Applications

Nurses who understand the valuing process can use this knowledge when counseling patients whose values fail to support healthy choices.

PATIENT PLACES LOW VALUE ON HEALTH AND HEALTH BEHAVIORS

You become frustrated when repeated attempts to teach or counsel a 26-year-old pharmaceutical salesperson meet with failure. Although hospitalized with a serious duodenal ulcer, all he can talk about is his job and meeting his sales quota.

To facilitate values clarification for this patient, first help him identify his basic values. Ask him, "What three things are most important to you in life?" or have him rank the following behaviors for how he would most likely spend an unexpected free day:

_____ Enjoy some quiet time alone (e.g., thinking, reading, listening to music)
_____ Spend time with family, friends
_____ Do something active (e.g., hiking, playing ball, swimming)
_____ Watch television

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

_____ Volunteer time and energy to help someone else
_____ Use time for my job
_____ Other

Discuss with the patient what his rankings suggest about his values. Ask whether his rankings would be different if asked how he *wished* he could spend the free day versus how he would *most likely* spend it.

VALUES OF PATIENT AND FAMILY MEMBERS CONFLICT

You sense a growing tension while counseling the young parents of a child with asthma. Questioning them ("You seem uncomfortable with what I'm saying now. Is there something wrong?") reveals that the wife smokes, has a pet cat, and has told her husband that even if these behaviors are hurting their child, she is unwilling to give them up.

To facilitate values clarification, suggest that both parents complete the following exercise, then talk with them about their different responses:

Where do you stand on the following issues? (Mark each as SA, strongly agree; A, agree; D, disagree; SD, strongly disagree; U, undecided.)

_____ A parent's primary obligation is to meet the needs of their children.
_____ Each member of a family is entitled to pursue personal pleasures, even if these are not in the best interest of all.
_____ Pleasure is more important than health.
_____ The choices one family member makes can dramatically affect other family members (positively or negatively).

This exercise will help the parents evaluate their basic values, explore areas of conflict, and perhaps move toward joint choosing, prizing, and acting on several health-promoting values.

ETHICS

Ethics is a systematic study of principles of right and wrong conduct, virtue and vice, and good and evil as they relate to conduct and human flourishing. The ability to be ethical, to make decisions and act in an ethical manner, begins in childhood and develops gradually. See Chapter 22 for two popular theories of moral development, Kohlberg's justice-based account and Gilligan's care-based account.

Many people use the term *ethics* when describing the systematic ethics incorporated within a code of professional conduct, such as nursing codes of ethics. The term **morals**, although similar in meaning, usually refers to personal or communal standards of right and wrong. It is important to distinguish ethics from religion, law, custom, and institutional practices. The fact that an action is legal or customary does not in itself make the action ethically or morally right. For example, many people believe that abortion and physician-assisted suicide are unethical in spite of their being legal options in some states and countries.

Since our values reflect what we believe is important, they are intimately related to and direct our ethical conduct. If I place a high value on patient safety and well-being, I am more likely to inconvenience myself to secure the patient's safety and well-being—even when this entails sacrifice—than a nurse who places less value on securing the patient's interests.

Recall **Mr. Raines**, the 68-year-old man experiencing homelessness and poverty who is being discharged with several medication prescriptions. Due to policy changes, this patient can no longer receive his medications at the clinic free of charge. Whether health care is a commodity that can be bought and sold in the marketplace ("Too bad, Mr. Raines, if you don't have insurance to cover your meds or money in your pocket…"), or a social good owed everyone, is a basic question in ethics.

Nursing Ethics

The *Encyclopedia of Bioethics* describes the scope of **bioethics** as a number of fields and disciplines grouped broadly under the rubric "the life sciences." At the heart of bioethics are three paramount human questions (Callahan, 1995):

- What kind of person should I be in order to live a moral life and make good ethical decisions?
- What are my duties and obligations to other people whose life and well-being may be affected by my actions?
- What do I owe the common good or the public interest in my life as a member of society?

Nursing ethics, which is a subset of bioethics, is the formal study of ethical issues that arise in the practice of nursing and of the analysis used by nurses to make and evaluate ethical judgments.

As nurses assume increasing responsibility for managing care, we must be prepared to recognize the ethical dimensions of our practice and to participate competently in ethical decision making. The newly revised American Nurses Association's (ANA) Scope and Standards of Practice (2021) has enhanced content to prepare every nurse to be better able to respond to the ethical challenges in everyday practice. Recommended are:

- Continuous appraisal of personal and professional values and how they may impact interpretation of an issues and decision making
- Awareness of the ethical obligations mandated in ANA's Code of Ethics for Nurses with Interpretive Statements (ANA, 2015)
- Knowledge of ethical principles and their application in the decision-making process, and
- Having the motivation and skills to implement a chosen decision.

Common ethical issues encountered by nurses in daily practice include cost-containment issues that jeopardize patient welfare; beginning and end-of-life decisions; breaches of patient confidentiality; and incompetent, unethical, or illegal practices by colleagues.

Theories of Ethics

Ethical theories or frameworks are systems of thought that attempt to explain how we ought to live and why. These theories may be broadly categorized as action-guiding theories that address the question "What should I do?" or character-guiding theories that address the question "What kind of person should I be?" Action-guiding theories fall into two main categories:

- Utilitarian. The rightness or wrongness of an action depends on the consequences of the action.
- Deontologic. An action is right or wrong based on a rule, independent of its consequences.

This distinction is important because it is involved in many ethical conflicts we experience in practice. For example, one nurse may believe that abortion is ethically justified in situations that result in the best consequences for the woman, child, and society (utilitarian argument). Another nurse may believe that abortion is wrong based on a rule that an innocent life should never be taken (deontologic argument).

Concept Mastery Alert

The utilitarian focus is based on "usefulness"—that is, actions are right when they promote the greater good and wrong when they do not. The deontologic focus views actions as right or wrong, regardless of the consequences.

Nurse ethicists frequently use two popular theoretical and practical approaches to "doing ethics": the principle-based approach and the care-based approach.

Principle-Based Approach

The **principle-based approach** to ethics combines elements of both utilitarian and deontologic theories and offers specific action guides for practice. The Beauchamp and Childress principle-based approach to bioethics (2012) identifies four key principles: **autonomy**, **nonmaleficence**, **beneficence**, and **justice** (Table 6-2). Many nurses add **fidelity**, veracity, accountability, privacy, and confidentiality to this list because they play a central role in the tradition of nursing (and medical) ethics and guide the behavior of health care professionals toward patients and their families.

Table 6-2 Principles of Bioethics

PRINCIPLE	MORAL RULE	IMPLICATIONS FOR NURSING PRACTICE
Autonomy (self-determination)	Respect the rights of patients or their surrogates to make health care decisions.	Provide the information and support patients and families need to make the decision that is right for them, including collaborating with other members of the health care team to advocate for the patient.
Nonmaleficence	Avoid causing harm.	Seek not to inflict harm; seek to prevent harm or risk of harm

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

		whenever possible.
Beneficence	Benefit the patient, and balance benefits against risks and harms.	Commit yourself to actively promoting the patient's benefit (health and well-being or good dying). Be sensitive to the fact that individuals (patients, family members, and professional caregivers) may identify benefits and harms differently. A benefit to one may be a burden to another.
Justice	Give each their due; act fairly.	Always seek to distribute the benefits, risks, and costs of nursing care justly. This may involve recognizing subtle instances of bias and discrimination.
Fidelity	Keep promises.	Be faithful to the promise you made to the public to be competent and to be willing to use your competence to benefit the patients entrusted to your care. Never abandon a patient entrusted to your care without first providing for the patient's needs.

Recall **Marissa Sandoval**, the 44-year-old woman who developed complications following extensive surgery for uterine cancer. The nurse would likely feel that the surgeon and residents are not being faithful (principle of fidelity) to their responsibility to address the patient's questions and fears. Unless the nurse can effectively advocate for Marissa with the medical team, the nurse's own ability to be faithful to Marissa and accountable for her well-being will be compromised.

The principles offer general guides to action. All things being equal, we ought to act at all times in a manner that respects the autonomy of others, benefits others, does not harm, treats others fairly, and is faithful to the promises we make to others. Rarely is this as simple as it sounds. Be sensitive to the fact that individuals (patients, family members, and professional caregivers) may identify benefits and harms differently. A benefit to one may be a burden to another.

Review the request by **Mr. Zhang**, the 32-year-old man described at the beginning of the chapter. Although the nurse may view the request for removal from the ventilator as harmful, most likely leading to the patient's death, the patient's view differs—that is, he does not want to be dependent on a ventilator to live. When conflict about how to apply these principles cannot be resolved, the nurse can request an ethics

consult, which is described at the end of this chapter.

Ethical dilemmas arise when attempted adherence to basic ethical principles results in two conflicting courses of action. There is no foolproof method for identifying which principle is most important when there is conflict between competing principles. Popularized versions of the principle-based approach to bioethics have too frequently resulted in a type of "quandary ethics" that diminishes in importance the everyday ethical concerns of nurses (Taylor, 1997) and misleadingly suggests that how ethical dilemmas are resolved is unimportant, as long as a person can justify their recommendation with recourse to a principle. Thus, many health care professionals equate ethics with decisions about whether to "pull the plug," ignoring the ethical challenges involved in daily decisions about what constitutes an honest day's work, how respectful we are to others, how truthful, how responsible, and how compassionate.

Care-Based Approach

Dissatisfaction with the principle-based approach to bioethics has led many nurses to look to care as the foundation for nursing's ethical obligations. The nurse–patient relationship is central to the **care-based approach**, which directs attention to the specific situations of individual patients viewed within the context of their life narrative. The care-based approach is essential to person-centered care. The care perspective directs that how you choose to "be" and act each time you encounter a patient or colleague is a matter of ethical significance. Ethics is not reduced to a decision to withhold or withdraw life-sustaining treatment. Characteristics of the care perspective include the following (Taylor, 1993):

- Centrality of the caring relationship
- Promotion of the dignity and respect of patients as people
- Attention to the particulars of individual patients
- Cultivation of responsiveness to others and professional responsibility
- A redefinition of fundamental moral skills to include virtues like kindness, attentiveness, empathy, compassion, reliability

Feminist Ethics

Feminist ethics is a particular type of ethical approach popular among nurses of all genders. It critiques existing patterns of oppression and domination in society, especially as these affect women and those experiencing poverty. The many forms of feminist ethics range in focus from assigned sex–related inequities to concern for the least well off. Nurses working within a feminist framework promote social policy that reflects a fundamental trust in women and those on the margins. This trust is recognition that all people deserve the opportunity to make legitimate choices about conditions that affect their lives and are deserving of respect whenever they exercise such facility. This approach reflects a full commitment to full personhood for marginalized people, and provides for basic human needs that are consistent with a person's capacity to flourish and that honors human dignity and relationality (Holland, 2001, pp. 74–75).

ETHICAL CONDUCT

Nurses committed to high-quality care base their practice on professional standards of ethical conduct as well as professional values. The study of professional ethical behavior begins in nursing school, continues in formal and informal discussions with colleagues and peers, and culminates when nurses "try on" and adopt the behaviors of role models who practice professional nursing consistent with high ethical standards. How do nurses learn the standards for professional ethical behavior? At the very least, nurses should cultivate the virtues of nursing, understand ethical theories that dictate and justify professional conduct, and be familiar with codes of ethics for nurses and standards for professional nursing conduct.

Moral Agency

Once professional nurses understand what is reasonable for the public to expect of them, the next step is to determine if you have the capacity to meet these expectations (i.e., "Am I trustworthy?"). What makes a nurse trustworthy is not holding a credential that is publicly recognized or bestowed by the requisite credentialing body. Rather, trustworthiness is proved in every clinical encounter when the nurse demonstrates that they are able to be trusted, in the moment, with the challenge at hand. This may be as simple (relatively speaking) as a change in the plan of care, such as transitioning from curative to purely palliative goals. Or it could as complex as rethinking obligations to critically ill patients in a pandemic when a shortage of personal protective equipment (PPE) forces choosing between the patient's need for cardiopulmonary resuscitation and the health of frontline caregivers. It is never a given.

Moral agency is quite simply the ability to be what is professed: a moral human, a moral parent, a moral professional nurse. **Moral agency** may be defined as the capacity to be ethical and to do the ethically right thing for the right reasons. For the professional nurse, moral agency is the capacity to be trusted to meet the reasonable expectations of the publics we serve, as articulated in the American Nurses' Association's Social Policy statement and Code of Ethics.

The fact that we want to be ethical nurses does not automatically mean we have some natural ability to always do the ethically right thing because we know it is the right thing to do. This ability, moral agency, must be cultivated in the

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

same way that nurses cultivate the ability to do the scientifically right thing when providing care. To see an illustration of how the elements of moral agency "work" in an actual situation, see Box 6-1. You will quickly see that agency requires the development of who we *are* as nurses that goes well beyond scope of practice, assigned roles, and a laundry list of tasks. Agency also requires internal and demonstrated motivation, professional support rooted in nursing's norms and values, and an environment where action is possible. Agency requires tenacity, courage, resilience, and perseverance.

Nurse Virtues

Virtues are human excellences, cultivated dispositions of character and conduct that motivate and enable us to be good human beings. Clinical virtues enable nurses to provide good care to patients. While there is no official list of essential virtues of nurses, the following virtues are frequently named:

- Competence
- Compassionate caring
- Subordination of self-interest to patient interest
- Self-effacement
- Trustworthiness
- Conscientiousness
- Intelligence
- Practical wisdom
- Humility
- Courage
- Integrity

Since these human qualities cannot be "put on" the way one puts on a set of scrubs or identity badge, it is important that they are part of the nurse's character, part of who the nurse is. As you read the above list, reflect on which virtues are already strengths and which you will need to practice until they become part of who you are. Once again, nurses must work hard to cultivate the dispositions of character that invite, and keep earning, the public's trust.

Civility

Civility might be one of the virtues we would include in a list of nursing virtues but it seems to merit its own focus in today's health care world. You will read more about this critical element in each nurse's ethical comportment in Chapter 8 on communication, but this chapter would be remiss not to call it to your attention as you begin to reflect on your personal "fit" for nursing. It is a strange world where topics like workplace bullying and lateral violence are commonplace. What can you promise yourself now that will ensure your presence in practice settings will be treasured? Ebberts and Sollars (2020) surveyed float nurses and asked them on a Likert scale of 1 to 5 the score they thought their unit would merit, with 1 being "strongly disagree" and 5 being "strongly agree." How would you respond to these statements if currently doing a clinical rotation?

Box 6-1 **Elements of Moral Agency in Action**

Situation: *A 75-year-old patient with end-stage lung cancer suffers a respiratory arrest and is coded, ventilated, and admitted to the intensive care unit (ICU). When the receiving nurse reviews his chart, she discovers that upon admission, his nurse documented that he "did not want to be resuscitated" and that he wanted to prepare an advance directive specifying "no heroics." There is no do-not-resuscitate order on the chart, and the nurse can find no advance directive.*

Moral Sensibility

The ICU nurse notes the discrepancy between the patient's documented preferences and the treatment and care that he has received. She senses personal discomfort/distress about this disregard for his wishes.

Moral Responsiveness

The nurse can decide to ignore her discomfort and simply provide excellent technologic care or acknowledge her discomfort and respond. She decides to talk with the attending physician about his knowledge concerning the patient's preferences and learns that the attending was unaware of the patient's documented preferences and has no personal knowledge of these. She contacts the nurse who originally admitted the patient and learns that although the patient was quite clear about his preference, no one followed up and translated this conversation into orders on his chart. She calls an ethics consult when the attending says that there is "nothing to be done now that treatment is initiated."

Moral Reasoning and Discernment

During the ethics consult, family members agree that the patient would not be happy to find himself on a ventilator and request that he be weaned—even if this results in his death. The ethicist explains that weaning him from an ineffective treatment (the ventilator will not cure his lung cancer) that is disproportionately burdensome is an ethically justified action.

Moral Accountability

The nurse initiated the ethics consult because she believed that she could not be an advocate for this patient and merely provide good physical care. Once she knew (or suspected) that his preferences had been ignored, she felt accountable for determining how the system had failed him and for remedying the problem. The nurse prides herself on being responsible and accountable and therefore could not "stick her head in the sand" and pretend that this was not her problem. After the ethics consult, she participates in plans to find an optimal time and conditions to wean the patient from the ventilator and makes sure that his family is present. The patient does not survive the weaning, and although they are grieving, his family members are grateful to the nurse for her care for the patient and for them.

Moral Character

Because she had cultivated the virtues of responsibility and fidelity, the nurse's course of action was natural.

Moral Motivation

As a health professional, the nurse's primary motivation needs to be secure the interests of the patient—even if this entails moving beyond her comfort zone. "Not rocking the boat" or not wanting to displease the patient's attending are not acceptable motivations.

Moral Valuing

Because she places a high value on patient well-being and being an effective patient advocate, the nurse was willing to confront the attending physician and initiate an ethics consult, even though these actions caused her some discomfort and the expense of time and inconvenience.

Transformative Ethical Leadership

When her colleagues asked her where she got the "guts" to follow through with this course of action, the nurse knew that the culture within the hospital had to change so that more nurses would choose to do the same thing she did without fearing negative consequences. She asks the nurse educator on her unit to explore the possibility of pursuing this theme in a future Nursing Grand Rounds and is willing to work to make this happen.

- I felt welcome on the unit.
- Someone offered me help when I needed it.
- If floated again, I would enjoy coming back to this unit.
- I had the resources I needed to complete my assignment.
- I witnessed someone expressing appreciation to another for good work.
- Staff showed concern for my well-being.
- I received appreciation for my work.

Gandhi is often quoted, "Be the change you want to see." How will you make your workplace a welcoming and supportive environment?

Nursing Codes of Ethics

Codes of ethics for nursing include the International Council of Nurses' (ICN) *ICN Code of Ethics for Nurses* (https://www.icn.ch/system/files/2021-10/ICN_Code-of-Ethics_EN_Web_0.pdf), the *ANA Code for Nurses With Interpretive Statements* (http://www.nursingworld.org/codeofethics), and the Canadian Nurses Association (CNA) *Code of Ethics for Registered Nurses* (https://www.cna-aiic.ca/en/on-the-issues/best-nursing/nursing-ethics). Students will also want to be familiar with the National Student Nurses' Association (NSNA) *Code of Academic and Clinical Conduct*, which can be found on the NSNA website (www.nsna.org). Epstein and Turner (2015) write that to practice competently and with integrity, today's nurses must have in place several key elements that guide the profession, such as an accreditation process for education and a rigorous system for licensure and certification (see Chapter 1) as well as a relevant code of ethics.

According to the ANA (2015), people who become nurses are expected not only to adhere to the moral norms of the profession but also to embrace them as part of what it means to be a nurse. The ethical tradition of nursing is self-reflective, enduring, and distinctive. A **code of ethics** is a set of principles that reflect the primary goals, values, and obligations of the profession.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Box 6-2 **American Nurses Association Code for Nurses**

1. The nurse practices with compassion and respect for the inherent dignity, worth, and unique attributes of every person.
2. The nurse's primary commitment is to the patient, whether an individual, family, group, community, or population.
3. The nurse promotes, advocates for, and protects the rights, health, and safety of the patient.
4. The nurse has authority, accountability, and responsibility for nursing practice; makes decisions; and takes action consistent with the obligation to promote health and to provide optimal care.
5. The nurse owes the same duties to self as to others, including the responsibility to promote health and safety, preserve wholeness of character and integrity, maintain competence, and continue personal and professional growth.
6. The nurse through individual and collective effort, establishes, maintains, and improves the ethical environment of the work setting and conditions of employment that are conducive to safe, quality health care.
7. The nurse, in all roles and settings, advances the profession through research and scholarly inquiry, professional standards development, and the generation of both nursing and health policy.
8. The nurse collaborates with other health professionals and the public to protect human rights, promote health diplomacy, and reduce health disparities.
9. The profession of nursing, collectively through its professional organizations, must articulate nursing values, maintain the integrity of the profession, and integrate principles of social justice into nursing and health policy.

Source: Reprinted from *Code of Ethics for Nurses with Interpretive Statements*. ©2015 By American Nurses Association. Reprinted with permission. All rights reserved.

The ANA Code of Ethics for Nurses serves the following purposes:

- It is a succinct statement of the ethical obligations and duties of every person who enters the nursing profession.
- It is the profession's nonnegotiable ethical standard.
- It is an expression of nursing's own understanding of its commitment to society. See Box 6-2.

The ICN writes that, to achieve its purpose, the Code of Ethics for Nurses must be available to students and nurses throughout their study and work lives. They recommend that nursing students do the following:

- Study the standards under each element of the Code.
- Reflect on what each standard means to them. Think about how they can apply ethics in their own nursing domain: practice, education, research, and management.
- Discuss the Code with coworkers and others.
- Use a specific example from experience to identify ethical dilemmas and standards of conduct as outlined in the Code. Identify how they would resolve the dilemma.
- Work in groups to clarify ethical decision making and reach a consensus on standards or ethical conflict.
- Collaborate with their national nurses' association, coworkers, and others in continuous application of ethical standards in nursing practice, education, management, and research.
- Codes help nurses accomplish these goals only to the extent that nurses uphold them.

Code requirements may exceed legal requirements. While violations of the law subject a nurse to civil or criminal liability (see Chapter 7), violations of the code of ethics may result in a reprimand, censure, suspension, or expulsion from the profession.

Standards of Professional Nursing Practice

Standard 7 of the ANA's Scope and Standards of Practice describes the nurse's ethical obligations. The Competencies in this standard begin with the statement that the "registered nurse uses the Code of Ethics for Nurses with Interpretive Statements (ANA, 2015) as a moral foundation to guide nursing practice and decision-making." The criteria that follow are derived from the Provisions of the Code of Ethics, reinforcing the importance of every nurse being familiar with the Code. Standard 8 outlines the competencies that enable the registered nurse to demonstrate advocacy in all roles and settings. Note that this is a brand-new standard, appearing for the first time in the 2021 *ANA Scope and Standards of Practice*. In the past, in spite of all the attention our Code of Ethics give to advocacy, many nurses viewed advocacy as an ethical ideal, not a nonnegotiable moral obligation. Our profession now wants every nurse to view advocacy as a duty and to prioritize advocating for any patient whose needs are unmet. As you begin your clinical practice, make sure to ask yourself if any of your patients have special advocacy needs and then determine what must happen for you to be an effective advocate. Make sure you are familiar with both standards! Also note that the 2021 revision of ANA's *Scope and Standards of Professional Practice* includes new content on models of ethical decision making and an appendix on

ethics, morals, and ethical theories and approaches.

Remember **Marissa Sandoval**, the 44-year-old woman who wants answers but is not getting them? Integration of these standards would be essential for the nurse to act professionally and ethically when obtaining the needed answers.

Bill of Rights for Registered Nurses

Two of the chief reasons nurses cite for the declining quality of nursing care at their facilities are inadequate staffing and decreased nurse satisfaction. Advocacy on behalf of nurses and the profession has resulted in a tangible tool, the Bill of Rights for Registered Nurses, to aid in improving workplaces and ensuring nurses' ability to provide safe, quality patient care. The Bill of Rights is intended to empower nurses by making clear what is absolutely nonnegotiable in the workplace.

Box 6-3 **Ethics Inventory**

Think about a recent ethical challenge you encountered in practice.

- What signals you to an ethical challenge? Intellectual disconnect? Queasy feeling in the pit of your stomach? Discomfort or disappointment in the way you or your team are responding? Yuck factor?
- Pay attention to how you reason as you think about how you should and would respond.
  - What informs your judgment? Rephrased, how do you calibrate your moral compass?
  - Are there moral "rules" that apply?
  - Do you have a responsibility to respond? Are you personally able and willing to respond? Which elements of moral agency will be most critical?
  - If you have conflicting duties or obligations, how will you determine which take priority?
- Are there any universal (nonnegotiable) moral obligations that obligate all health care professionals? What guidance does the ANA Code of Ethics offer for this situation?
- Does the agency/institution have an ethics environment or culture that promotes ethical decision making and behavior? Are there institutional or other external variables making it difficult or impossible to respond?
- Are you confident in your ability to respond ethically?
  - What counts as a good response? What criteria/principles do you use to inform and justify your response?
    - Promotes human dignity and the common good
    - Maximizes good and minimizes harm
    - Justly distributes goods and harms
    - Respects rights
    - Is responsive to vulnerabilities
    - Promotes virtue
    - Other
  - What criteria/principles do you use to critique/evaluate your response?
    - I stayed out of trouble—not greatly inconvenienced.
    - My/our reputation is intact.
    - "I could tell my children what I/we did and feel proud." (Washington Post test)
    - I'm able to put my head on my pillow and fall asleep peacefully.
    - I am transparent in my deliberations, decisions, and behavior.
    - Other
- To whom would you turn if you were uncertain about how to proceed?
- What agency resources exist to help you think through and secure a good response? How confident are

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

you that these resources would facilitate a good resolution of your concern?
- What barriers are nurses likely to encounter when trying to resolve these types of challenges? What would make intervening most challenging in this practice setting? Would you expect nurses wanting to intervene to experience moral distress?
- If you believe that institutional or other variables are making it impossible to do what you believe is the ethically right thing to do, what are your options?

The seven basic tenets of the Bill of Rights for Registered Nurses are:

. Nurses have the right to practice in a manner that fulfills their obligations to society and to those who receive nursing care.
. Nurses have the right to practice in environments that allow them to act in accordance with professional standards and legally authorized scopes of practice.
. Nurses have the right to a work environment that supports and facilitates ethical practice, in accordance with the Code of Ethics for Nurses and its interpretive statements.
. Nurses have the right to freely and openly advocate for themselves and their patients, without fear of retribution.
. Nurses have the right to fair compensation for their work, consistent with their knowledge, experience, and professional responsibilities.
. Nurses have the right to a work environment that is safe for themselves and their patients.
. Nurses have the right to negotiate the conditions of their employment, either as individuals or collectively, in all practice settings (http://nursingworld.org/NursesBillofRights, used with permission).

ETHICAL EXPERIENCE AND DECISION MAKING

Ethical experience comes in many varieties for professional nurses. See the accompanying Box 6-3, Ethics Inventory. Two types of ethical problems commonly faced by nurses are ethical dilemmas and moral distress. In an ethical dilemma, as described earlier, two (or more) clear moral principles apply but support mutually inconsistent courses of action. **Moral distress** occurs when you know the right thing to do, but either personal or institutional factors make it difficult to follow the correct course of action.

Moral Distress and Resiliency

When nurses are unable to translate their ethical judgments into action, their integrity is compromised. Nurses need sound analytic skills and the ability to engage in ethical reasoning to resolve ethical dilemmas and moral distress. The American Association of Critical-Care Nurses has developed a helpful model to "Recognize and Address Moral Distress," (https://www.aacn.org/~/media/aacn-website/clincial-resources/moral-distress/recognizing-addressing-moral-distress-quick-reference-guide.pdf) part of which is illustrated in Figure 6-1 (on page 128). Rushton and Kurtz (2015) and Rushton et al. (2016) offer helpful hints for developing the necessary capacities to deal with moral distress, including recognizing the symptoms of moral distress and speaking up about your ethical concerns. Rushton et al. (2016) urge all nurses to become agents in creating a workplace environment that minimizes moral distress. In keeping with Provision 6 of the ANA's Code of Ethics, "recognize and honor your responsibility to work collectively toward a culture in which ethical practice is expected, valued and supported."

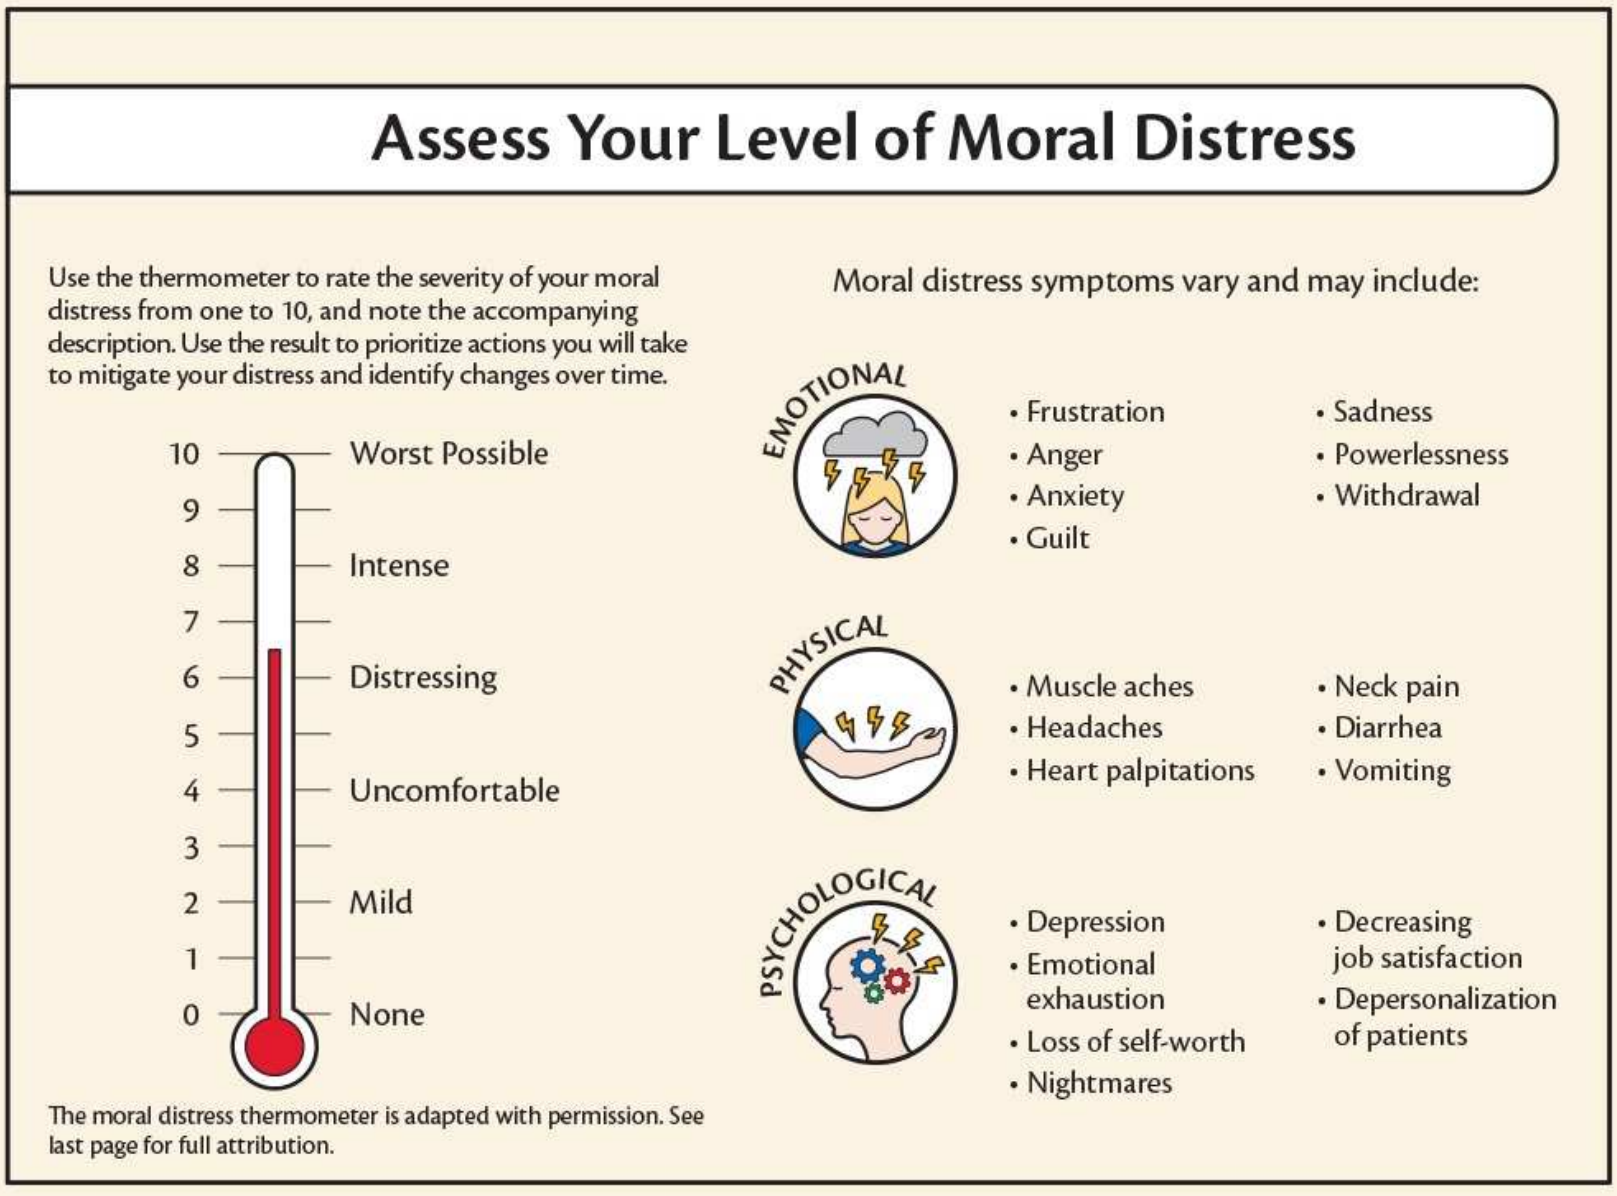

FIGURE 6-1. Assess your level of moral distress. (*Source:* Used with permission. American Association of Critical Care Nurses. [2020]. Recognize and Address Moral Distress. The moral distress thermometer is the result of research works authored by Lucia Wocial, PhD., RN and Dr. Michael Weaver at the Indiana University School of Nursing, with graphics and associated software developed by Robert "Skip" Comer, research associate at the Indiana University-Purdue University Indianapolis School of Informatics and Computing.)

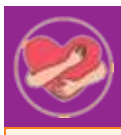
Today a number of resources are being developed to address moral distress in health care. Epstein et al. (2019) published a validated tool to measure moral distress, the measure of moral distress for health care professionals (MMD-HP). Rosenthal and Clay (2015) launched The Moral Distress Education Project. The aim of the project is to educate, inform, and destigmatize moral distress. The program includes a "welcome video" in which core multidisciplinary experts on moral distress were interviewed, and multiple resources. The video can be viewed at http://moraldistressproject.med.uky.edu/moral-distress-home. More recently nurse leaders met to explore strategies to develop moral resilience and support ethics practice. Their executive summary resulted in group consensus on recommendations for addressing moral distress and building moral resilience in four areas: practice, education, research, and policy (Rushton et al., 2017). An increasing number of practice sites now have moral distress consult services available to health care professionals.

The capacity to recover, adapt, and even thrive in the face of threats, misfortune, or challenging times is termed *resilience*. **Moral resilience** is the developed capacity to respond well to morally distressing experiences and to emerge strong. While there are numerous guides about developing resilience, the American Psychological Association's 10 ways to build resilience are often cited. Included in the association's list are the importance of cultivating good relationships, accepting that change is a part of living, refusing to view crises as insurmountable, nurturing a positive view of self and taking care of self, and keeping things in perspective.

Giving Voice to Values

Giving Voice to Values (GVV) is an innovative approach to values-driven leadership development in business education and the workplace, pioneered by Dr. Mary C. Gentile. GVV is not about persuading people to be more ethical. Rather GVV starts from the premise that most of us already want to act on our values, but that we also want to feel that we have a reasonable chance of doing so effectively and successfully. Rather than a focus on ethical analysis, the GVV curriculum focuses on ethical implementation and asks the question: "What if I were going to act on my values? What would I say and do? How could I be most effective?" GVV is all about shifting the discussion in ethics from the cognitive realm—"What is the right thing to do?"—to the practical realm: "When I know the right thing to do, how can I act effectively in a way that honors my values?" Perhaps most interesting, Gentile draws on what she learned about muscle memory in a self-defense class. The GVV approach is all about developing a "*moral* muscle memory." If we practice finding ways to be comfortable and skillful doing the things that mean the most to us, that accord with our

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com



highest aspirations, we will do this routinely. Then we can bring our whole identity to work with us and not feel alienated from our truest, most authentic self. The converse leads to burnout and moral distress (http://www.givingvoicetovaluesthebook.com/).

Moral Injury

A popular definition describes **moral injury** as occurring when there has been: (1) a betrayal of what is right, (2) by someone who holds legitimate authority or by oneself (Litz et al., 2009), (3) in a high-stakes situation (Shay, 1991, 2014). Consequences of moral injury can manifest as unique components of the psychological symptoms of posttraumatic stress disorder when the deeply held moral and ethical values of a person are transgressed. Putting it simply, moral injury is "a deep soul wound that pierces a person's identity, sense of morality, and relationship to society" (Silver, 2011, https://bit.ly/2YGfbTt).

Research attempting to better qualify and quantify moral injury and morally injurious experiences (MIEs) are increasingly being developed, refined, tested, and conceptually extended to populations such as in teachers exposed to violence, traumatized refugees, people who have experienced sexual violence, police officers, social workers, and nurses.

The term *moral injury* has been adopted to describe the emotional, spiritual, and psychological wounds affecting individuals that result from exposure to a potentially cruel or unjust environment's ethical and moral dilemmas. Moral injury has also been a consequence after perpetrating, failing to prevent, or bearing witness to acts that transgress deeply held moral beliefs and individual expectations (MIEs) (Litz et al., 2009).

Nurse Self-Care Alert

Violations of moral values and beliefs can put an individual at risk for burnout, posttraumatic stress disorder (PTSD), and other trauma-related problems. Exposure to morally injurious experiences (MIEs), or even potential MIEs, are associated with poor mental health outcomes (e.g., depression, anxiety, PTSD, suicidal thinking) and also seem to influence behaviors such as hostility (Williamson et al., 2018). Be sure to seek help from trusted sources if you find yourself experiencing this.

While moral injury has most commonly been associated with war veterans, there is empirical evidence of moral injury occurring in nurses. See Figure 6-2. One moral injury study of nurses who had been involved with a patient safety incident (historically called *second victims*) found that they experience moral injury symptoms of guilt, shame, spiritual/existential crisis, and loss of trust after such involvement (Stovall et al., 2020). Other symptoms experienced by the nurses involved with a patient safety incident included depression, anxiety, anger, self-harm, and social problems. These nurses also had difficulty with making meaning of the incident, had a change in worldview, suffered hyperarousal and other physical symptoms, and even considered leaving their job or the nursing profession altogether.

FIGURE 6-2. Moral injury, described as "a deep soul wound that pierces a person's identity, sense of morality, and relationship to society," also affects nurses. (*Source:* Used with permission from Shutterstock. *Photo by Dragana Gordic*.)

One group has developed a Moral Injury Symptom Scale-Healthcare Provider edition in an effort to capture the constellation of moral injury symptoms experienced by physicians, nurses, and other health care providers (Mantri et al., 2020). With the challenges of providing care with limited resources during the COVID-19 pandemic, experts in this field have begun to wonder whether undiagnosed moral injuries among health care providers may underlie burnout and other emotional conditions so often reported by those on the front lines of clinical care (Kopacz et al., 2019). Research in these areas is forthcoming.

Conscientious Objection

The ANA Code of Ethics for Nurses recognizes that some nurses are asked to tolerate practice conditions that seriously violate their personal and professional standards and integrity and supports nurses who refuse to accept these conditions. **Conscientious objection** is the refusal to participate in certain types of treatment and care based on the fact that these activities violate the nurse's personal and professional ethical beliefs and standards. Lachman (2014) writes that having moral integrity means being faithful to deeply held religious or moral conviction and that the willingness to live and act according to an internally consistent set of basic moral ideas is considered a desirable character trait (p. 196).

> Where nurses are placed in situations of compromise that exceed acceptable moral limits or involve violations of the moral standards of the profession, whether in direct patient care or in any other forms of nursing practice, they may express their conscientious objection to participation. Where a particular treatment, intervention, activity, or practice is morally objectionable to the nurse, whether intrinsically so or because it is inappropriate for the specific patient, or where it may jeopardize both patients and nursing practice, the nurse is justified in refusing to practice on moral grounds (ANA, 2015, p. 21).

If you find yourself feeling compromised by activities you are asked to perform, be sure to speak with your instructor or a respected colleague.

Making Ethical Decisions

The Joint Commission mandates that all accredited facilities have a mechanism for addressing ethical problems. Nurses should be familiar with (and use) the resources within their institutions. Most institutions have ethics committees (discussed on page 135), and many employ staff ethicists. A growing number have nurse ethicists. Nurses will also find helpful resources for ethical decision making on the ANA website (www.nursingworld.org) and the American Association of Critical-Care Nurses website (www.aacn.org). Also see the section on creating and sustaining healthy

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

work environments in Chapter 19.

In order for the nurse to be confident in ethical decision making, the steps of the nursing process may be used to help guide ethical decisions:

Step 1: Assess the Situation (Gather Data). Recognize and then describe the situation and contextual factors that give rise to the ethical problem. This involves the main people involved (their views and interests); the patient's overall nursing, medical, and social situation; and relevant legal, administrative, and staff considerations.

Step 2: Diagnose (Identify) the Ethical Problem. Clarify that the issue is ethical in nature: (1) Is there a conflict at the personal, interpersonal, institutional, or societal level? Is there a question that arises at the level of thought or feeling? (2) Does the question have a moral or ethical component? Why? For example, does it raise issues of rights, moral character? State the problem clearly. Identify your relationship to the decision. Identify time parameters. Make sure that the problem is an ethical problem rather than a communication or legal problem. Some suggest that whenever human dignity is being threatened, you have an ethical problem.

Step 3: Plan (Identify and Weigh Alternatives). Identify options and explore the probable short-term and long-term consequences of each for each stakeholder. Use ethical reasoning to decide on a course of action that you can justify ethically:

- Identify your personal and professional moral positions and values and those of other involved people.
- Apply pertinent ethical theories and principles.
- Apply codes of conduct and ethics, professional position statements or guides, and institutional policies as applicable.
- Consider consulting with a respected and wise colleague or an institutional ethics committee or consultant.
- Decide on the course of action that you are best able to support.

Step 4: Implement Your Decision. Implement your decision and begin to compare the outcome of your action with what you considered and hoped for in advance.

Step 5: Evaluate Your Decision. What have you learned from this process that will help you in the future? How can you improve your reasoning and decision making in the future? In what ways does your institutional culture need to change to prevent similar conflicts in the future?

The accompanying patient care study (Box 6-4) illustrates this five-step model of ethical decision making. Other models of decision making are described in *Nursing: Scope and standards of practice*, 4th ed. (ANA, 2021).

Box 6-4 Patient Care Study Using a Five-Step Process for Resolving Ethical Conflict

Jean Watts is a labor and delivery room nurse in a small community hospital that serves both private and clinic patients. Jean has always felt that certain members of the obstetrics–gynecology medical staff have treated these two groups of patients differently. On this particular morning, Jean is caring for a woman who is scheduled for an elective cesarean delivery. The woman (who is a clinic patient) has made it very clear that she wants to be awake for the delivery and has requested epidural or spinal anesthesia. Jean is dismayed when the anesthesiologist enters the delivery room because the anesthesiologist's success rate with epidural anesthesia is poor. The anesthesiologist unsuccessfully attempts to perform an epidural block. After waiting 20 minutes for results, the obstetrician is growing impatient and instructs the anesthesiologist to put the patient to sleep. Jean feels the rights of this patient are being violated but is unsure how she should respond.

Step 1: Assess the Situation (Gather Data)

The patient is in stable medical condition (elective cesarean delivery, not an emergency) and has made it very clear that she wishes to be awake for the delivery. The patient is not a private paying patient of the obstetrician. The nurse believes that her role is to promote and protect the patient's interests; she knows of no reason in this case why the patient's preferences should be disregarded.

The anesthesiologist has a poor success record with epidural anesthesia.

The obstetrician seems to want to complete the delivery quickly. In the past, he has seemed to give more weight to following wishes of private patients than those of clinic patients. He is the head of the obstetrics–gynecology department; he believes that nurses should obey health care providers unquestioningly.

Nurses have in the past expressed dissatisfaction with the different levels of care being provided to private and clinic patients, but no one to date has formally addressed the concern.

Step 2: Diagnose (Identify) the Ethical Problem

Jean objects to the obstetrician's intent to disregard the patient's wish to be awake for her delivery; she is

aware of no good reasons justifying this course of action.

The nurse will be a participant in carrying out the decision.

The decision for this case must be made immediately; it would also be helpful to plan to avoid situations like this in the future.

Step 3: Plan

a. Identify Options

The nurse can say nothing to the obstetrician and help with the delivery. If asked by the patient later why she needed to be put to sleep, the nurse can (1) tell the truth, (2) refer her to the obstetrician, (3) express sympathy that she could not be awake, or (4) say nothing. *Outcome:* The patient's wishes are disregarded; delivery occurs quickly, and the obstetrician is happy; the nurse fulfills obligation to the health care provider and hospital but feels she has betrayed the patient's trust. *Long-term outcome:* There is a good probability the same problem will happen again.

OR

The nurse can remind the obstetrician that the patient was adamant about wanting to be awake and suggest that a different anesthesiologist be called in. If the obstetrician agrees, the patient may get her wish and everyone is satisfied with the outcome (the nurse must still decide how to prevent recurrence of this dilemma). If the obstetrician refuses and insists that the patient be put to sleep, the nurse can (1) refuse to participate (but if another nurse is unavailable or unwilling to replace her, the nurse will have abandoned the patient and harm may ensue); or (2) participate and proceed as described or resolve to speak to the obstetrician in a "cool moment" after the delivery to see how to avoid this problem in the future. If the nurse is not satisfied with the obstetrician's response, then she must decide whether to move through the proper administrative channels. Depending on the institution and people involved, the nurse may be affirmed or censured for this move. *Long-term outcome:* Future patients may be helped by the nurse following through with her concerns.

OR

The nurse can say nothing and assist with this delivery, believing it to be the wisest course of action for the time being, but resolve to take the steps described to correct the perceived injustice. *Outcome:* There is no benefit for the present patient but there is potential benefit to future patients.

b. Think the Ethical Problem Through

Basic moral principles: The good of patients (beneficence) should be the nurse's primary concern (ANA Code of Ethics for Nurses); this strongly suggests that the nurse should act, but it does not address the nurse's obligation to do so if she feels it would jeopardize her own good (job security).

Respect for persons would suggest that the patient's autonomy (right to self-determination) should be respected unless there is strong justification for not doing so.

Justice would suggest that whether a patient pays the obstetrician privately should have no bearing on the quality of care received.

Care-based ethics would obligate Jean to serve as an effective advocate for her patient, respecting the nurse's commitment to be faithful to the nurse–patient relationship.

c. Make a Decision

Jean feels from past interactions with this obstetrician that her speaking up will not influence his decision to have the patient put to sleep. She decides to speak with the obstetrician after the delivery and follow-up with whatever approach is necessary to avoid recurrence.

Steps 4–5: Implement and Evaluate Your Decision

Jean will never know whether speaking up might have resulted in the patient's wishes being respected. Although she is dissatisfied with the outcome of this case, she hopes to prevent this from happening to other clinic patients in the future. In this instance, a hospital committee was formed to study the problem and make recommendations. If Jean had been told to "mind her own business" unless she wanted trouble, she would have had to make a decision weighing patient benefit on one hand with potential personal risk or harm on the other.

Ethically Relevant Considerations

Fletcher et al. (2005) recommend attention to eight ethical considerations that have the greatest weight and relevance in the care of patients, which bridge between ethical principles, an ethics of caring, and the clinical situation (p. 12).

. **The Balance between Benefits and Harms in the Care of Patients.** Nurses are superbly positioned to contribute to reasoning about the benefits or burdens of treatment and the related harms, since their relationships with patients enable them to see more than physiologic effects.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

. **Disclosure, Informed Consent, and Shared Decision Making.** There are three basic models of health care decision making. In the *paternalistic model*, clinicians decide what ought to be done to benefit the patient and inform the patient, and the patient's role is to comply. In the *patient sovereignty model*, patients or their surrogates, expressing their right to be autonomous, tell the clinician what they want, and the clinician's role is to comply. Most ethicists reject these models in their extremes and recommend a model of *shared decision making*, which respects and uses the preferences of the patient and the expertise and judgment of the clinician. *The object of all clinical decision making is decisions that secure the health, well-being, or good dying of the patient and that honor and respect the integrity of all participants in the decision-making process.* Nurses can play an important role in ensuring that patients and their surrogates receive the information and support that they need to make health care decisions that secure their interests.
. **Norms of Family Life.** Most patients are not isolated individuals. Nurses who are sensitive to how a patient's injury or illness affects family members and significant others can better appreciate how this influences decisions about care, and can bring this information to the interdisciplinary team.
. **The Relationship between Clinicians and Patients.** The healing encounter is central to nursing ethics. As nurses reason ethically about what should be done, it is always in the context of our relationships with and duties to patients and their families as well as with other professional caregivers. Much ethical distress for nurses results from the strong conviction that we owe individual patients more than our work environments allow us to deliver.
. **The Professional Integrity of Clinicians.** While the 2015 ANA Code of Ethics for Nurses clearly states that the primary commitment of the nurse is the patient, it also states that the nurse owes the same duties to self as to others—including the responsibility to preserve integrity, to maintain competence, and to continue personal and professional growth. Nurses should think long and hard when they find themselves asked to sacrifice personal integrity to meet the needs of another.
. **Cost Effectiveness and Allocation.** The increasing awareness of how difficult it is to make valued and scarce health resources available to all in need has resulted in new appreciation for the moral relevance of cost effectiveness. Nurses who are committed to patient advocacy bridge the sometimes overwhelming needs of patients and their families and the limited resources available to professional caregivers. Justice is the principle of bioethics that speaks to distributing the benefits and burdens of health care delivery fairly. Nurses are uniquely positioned within the interdisciplinary team to speak to what it means to give patients or patient cohorts "their due."
. **Issues of Cultural and/or Religious Variation.** Since many conflicts about what should be done are rooted in different cultural or religious beliefs and values, nurses who are sensitive to the cultural and religious identity of patients and caregivers can help mediate these conflicts. Read more about culturally respectful care in Chapters 5 and 47.
. **Considerations of Power.** Differences in power underlie many of the ethical challenges encountered in clinical practice. Injury and illness make even sophisticated consumers of health care vulnerable. Nurses and other caregivers should be vigilant to challenge any abuses of power by clinicians. Clinicians who believe that they lack power to influence care settings and delivery may also experience ethical conflict and distress.

Examples of Ethical Problems

Ethical problems commonly arise between nurses and patients, nurses and health care providers, nurses and other nurses, and nurses and their employing institutions. Moreover, nurses are often most conflicted when good practice seems to require acting against their personal moral convictions. As you read through the following mini-cases, try to determine how you would respond. The process of ethical decision making described previously should prove helpful. Note that many ethical challenges will be addressed in other chapters, especially Chapters 44 and 46. Read through the accompanying Thoughtful, Person-Centered Practice: Challenging Topics Reproductive Decisions.

Paternalism

An alert older resident who lives in a long-term care facility and who is now at high risk for falls refuses to call the nurse for assistance when getting out of bed. The nurse must decide whether to obtain an order to restrain the patient. Does preventing potential harm justify violating the patient's right to autonomy and make it acceptable for the nurse to act as a "parent," choosing an action the patient does not want because the nurse believes it to be in the patient's best interest?

Deception

A postoperative patient asks the student nurse, who is about to administer an intramuscular injection for pain, "Is this your first shot?" It does happen to be the student's first injection, and the student is anxious. Would the student's intent to decrease the patient's anxiety justify telling the patient, "No, I've given several before"?

Thoughtful, Person-Centered Practice: Challenging Topics

Reproductive Decisions

Many controversial issues make it challenging to know how to respond as a professional nurse in select scenarios. Often, the nurse's personal and/or professional values may conflict with options desired by patients, families, employers, and communities. Not infrequently, nurses have to make clinical judgments that balance promoting and safeguarding personal integrity and respecting the values and preferences of

patient. The Baccalaureate *Essential*s for nurses includes the ability to communicate to the health care team your personal bias on difficult health care decisions that impact your ability to provide care (AACN, 2008, Essential VIII: Professionalism and Professional Values; also see AACN, *The essentials: Core competencies for professional nursing education* (2021).

Read the scenario below and see if you can articulate what you believe, why you believe this, and how these beliefs are likely to inform the decisions you make and your behavior, especially when you are confronted with competing obligations. Based on Tanner's Clinical Judgment Model (2006), consider reflection-in-action and reflection-on-action (Nielson et al., 2007):

Reflection-in-Action

As you read, consider what the new nurse is thinking in the moment—what happened? How did the patient, family, and/or health care provider respond? What did the nurse do next?

Scenario

As a new graduate nurse on a high-risk labor and delivery unit, I was floating around the floor without a specific assignment. I was asked to assist fellow staff members and, in general, "lighten the load" around the unit. As things got busy, the charge nurse asked me to take over a patient who was in the early stages of an induced abortion. I had heard the patient's back story in huddle but had not had direct contact with the patient yet that day. She was middle aged and a recent immigrant from Ethiopia. Her husband was the sole breadwinner of the family, and her water broke at 20 weeks. She was forced to choose between: (1) staying on bed rest to possibly maintain her unsafe pregnancy to viability; or (2) terminating her pregnancy, which would allow her to continue taking her 3-year-old son to his weekly brain cancer treatments. She chose to terminate. She was in pain, and she was alone. In that moment, I was faced with the decision of whether to help the suffering patient, her unborn baby, my charge nurse, and my fellow staff *or* stand by my cultural, religious, and ethical beliefs, which have always told me that abortion is never the answer, and refuse to care for this patient.

Effective Noticing (Cues)

1. What did you notice about the situation initially? What information/observations are significant? What information deviates from what is expected/normal/usual?

Effective Interpreting

2. How would you prioritize this data? What other assessment data, evidence, and/or information would you need to consider the situation? How would you obtain this additional information?
3. What do you think about this situation? Consider personal and previous nursing experiences that you have had and formal knowledge (physiology, psychology, communication skills) that may be of assistance in providing care in this situation.

Scenario

I chose to attend the delivery and support the patient and my team. In this scenario, I believe I made the correct decision based on the outcomes I expected prior to entering the room. I supported the laboring mother, cherished the dying fetus and helped my distressed fellow staff. Though I was in moral distress following the delivery, the outcomes for those involved (patient, fetus, and staff) outweighed my feelings and personal stance. I recognized the abortion was happening regardless of my beliefs or personal values. The fetus would die regardless of what my parents taught me or what upbringing instilled in me. The negative effects on the mom and family outweighed the statistical and physiologic improbability of the fetus's survival. The way for me to create the best outcomes would be by supporting and caring for those involved in this difficult situation. I felt a little like I was doing damage control—there was no way to affect the outcome. Last, I realized, though I think something is wrong, it may not be. Certainly, it was not perceived as wrong to the others involved in the delivery. Now, I consider outcomes as selflessly as possible, and I do not treat patients how I want to be treated. Instead, I treat them how they want to be treated.

Effective Responding

4. How would you describe the obligations you have in this scenario to your patient, to yourself, and to your team?
5. If you cannot fulfill each of these obligations, how will you prioritize them? What basis/rationale do you use for prioritization? Remember that the ANA *Code of Ethics for Nurses* reminds us that "the nurse's primary commitment is to the patient," while at the same time states that "the nurse owes the same duties to self as to others, including the responsibility to promote health and safety, preserve wholeness of character and integrity, maintain competence, and continue personal and professional growth.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Effective Reflecting

This hospital does perform abortions and also respects a health care professional's decision not to participate. In this instance, the nurse has a long-held belief in the sanctity of life and has always believed that abortion is wrong. However, she also finds herself wanting to be an advocate for her patient and is concerned about all the talk in the unit from nurses who are judging the patient to be a "bad" mother. No one wants to accept responsibility for this assignment.

6. Do you agree with the choice the nurse made? Would you have made the same choice? Why or why not? What would inform your decision? If the nurse had refused to participate, would you respect this choice?
7. Do you agree with the criteria the nurse used to evaluate her decision? How do you evaluate your clinical and moral judgments?
8. What resources can you access to better inform your decision?
9. Whether you decide to accept or refuse the assignment, how might you use reflective practice to evaluate your decision so you can respond more confidently in the future? What criteria will you use to evaluate a good response?
10. What personal attributes and competencies are most likely to lead to a good response?

Reflection-on-Action

Then look back at the nurse's decisions and reflect on your learning—how did your knowledge and/or skills expand based on this scenario? What attitude, value, or belief shifts did you experience (if any) after reading this scenario? What would you do differently if you were in this situation? What more do you need to know to be able to manage this or a similar situation in the future?

Nielson, A., Stragnell, S., & Jester, P. (2007). Guide for reflection using the Clinical Judgment Model. *Journal of Nursing Education*, *46*(11), 513–516.

Tanner, C. A. (2006). Thinking like a nurse: a research-based model of clinical judgment in nursing. *Journal of Nursing Education*, *45*(6), 204–211.

Privacy and Social Media

A nursing student in your class shows you her recent Facebook posting that includes a photo of a patient with a large sacral pressure injury. She says that since the patient is lying face down, this is not an invasion of privacy. What patient information can you post ethically on social media sites? How would you respond? Be familiar with guidelines for use of social media issued by the NSNA, ANA, and the National Council State Boards of Nursing. See more on social media in Chapters 7 and 21.

Confidentiality

A nurse asks a middle-aged woman who is crying quietly, "Would you like to share what's troubling you?" The woman tells the nurse that she has no idea how she will pay for this clinic visit because she entered the country illegally 2 months ago and is trying to earn enough money to help her family back home. She begs the nurse not to tell anyone. If the nurse believes that this anxiety is interfering with the patient's ability to obtain needed health care, would it be ethical to break the woman's confidence to obtain help for her?

Allocation of Scarce Nursing Resources

A nurse has just been pulled from your unit, leaving it understaffed. Among your patients is a 33-year-old man recovering from a heart attack who is being discharged in the morning (he tells you that he still has many questions); an older adult who is close to death; and a woman with cancer who has been vomiting all day and who is in severe pain. You know that you cannot meet everyone's needs well. How do you "distribute" your nursing care? (You really like the patient who is going home in the morning.)

Valid Consent or Refusal

A resident is attempting to perform a spinal tap on an adolescent whom you know dislikes the resident. After one failed attempt, the adolescent tells the resident to stop. The resident asks you to administer an antianxiety medication to the patient to enable the resident to get the spinal tap done quickly. Should you administer the medication knowing that the patient no longer consents to the procedure?

Conflicts Concerning New Technologies

A woman who is infertile asks you what you think about in vitro fertilization. She tells you that she is "desperate to produce a child for her husband and in-laws" but also has grave reservations about the whole process. "I've read about couples who end up with seven frozen embryos, and I think that would kill me, thinking I've got seven potential kids 'on ice.'" How do you respond? What informs your response?

Unprofessional, Incompetent, Unethical, or Illegal Physician Practice

A nurse who works in the operating room notices that a pediatric surgeon who has been on the staff for several years and has done excellent work suddenly seems not to be concentrating during surgery and to be making more mistakes than usual. Rumors have been circulating about the surgeon having a problem with cocaine abuse after his recent divorce. The parents of one pediatric patient are dissatisfied with the progress the patient is making and ask the nurse for an opinion about the surgeon. Should the nurse voice personal concerns? Is the nurse ethically obligated to report the physician to the proper hospital authority for investigation?

Unprofessional, Incompetent, Unethical, or Illegal Nurse Practice

When you make your morning rounds, a patient tells you that one of the nurses fondled her body and made suggestive remarks during the previous night shift. You suspect that the patient may simply be trying to cause trouble, and because you like the nurse in question, you find it hard to believe the patient. What should you do?

Short Staffing Issues

Restructuring has resulted in chronic understaffing on the unit where you work. You believe that patients are now at risk because there simply are not enough nurses to provide quality care. Some nurses are talking about forming a union and going on strike. Because yours is the only major hospital in a rural area, you are unsure whether striking is a morally legitimate option. Because efforts to get management to address the issues have repeatedly failed, you are also contemplating "going public" with your concerns. Your brother works for the local newspaper, and he would be willing to do a story about the situation at the hospital. What do you do?

Beginning-of-Life Issues

You are a psychiatric mental health nurse working in a Catholic hospital whose ethical and religious directives forbid abortion and abortion counseling. You are talking with a single woman recently hospitalized with bipolar disorder who is in the first trimester of an unplanned pregnancy and who is expressing great ambivalence about continuing the pregnancy. You personally believe that your ethical obligation is to assist this woman in exploring abortion as an option and to refer her to outside resources if she elects to abort. The charge nurse tells you that these are not appropriate conversations within this hospital. How do you reconcile your clinical obligations with your employee responsibilities?

End-of-Life Issues

You are the nurse case manager for a woman with a history of cancer whose cancer has recurred after many years and is now seriously advanced. She frequently tells you when you come to visit her at home that she is unwilling to fight anymore and wants to die with some dignity while she is still in control. She begs you to get her something that will "put me gently to sleep once and for all before my pain gets worse." You believe that this is the woman's sincere wish, not just depression speaking, and you honestly believe that she would be better off spared the last stage of her fatal illness. According to your religious beliefs, however, assisted suicide is wrong under any circumstances. How do you reconcile your desire to help this woman with your profession's ethical code and your religious conviction that what she is asking for is wrong? (For a fuller discussion of ethical issues at the end of life, see Chapter 44.)

Nurses and Ethics Committees

An increasing number of health care institutions have developed ethics committees whose chief functions include education, policy making, case review and consultation, quality, and in some cases research. Some committees focus on clinical ethics and some on organizational ethics. These committees are well equipped to deal with the complexities of modern health care because they are multidisciplinary and provide a forum for different views to be aired without fear of repercussion.

Increasingly, hospitals are hiring ethics consultants to address the ethical issues that arise in the care of patients. Nurses bring an important voice to the ethics committee or consultant. When clinical issues are being reviewed, nurses can help to ensure that the technical facts are understood, that the appropriate decision makers have been identified, that the patient's medical and overall best interests have been identified, and that the course of action selected from the alternatives is justified by sound ethical principles. Nurses' strong backgrounds in interpersonal communications allow us to contribute unique knowledge about the patient and family to the discussion and to facilitate the ethics committee's group dynamics. Nurses also play an important role in policy making. We are frequently able to identify what policies are needed to address recurring ethical concerns and to suggest needed modifications of existing policies.

CONFLICTS OF COMMITMENT

While the ANA Code of Ethics offers practical guidance on many of the ethical challenges nurses face, it also creates a conflict for nurses with two of its provisions:

Provision 2: The nurse's primary commitment is to the patient, whether an individual, family, group, or community.
Provision 5: The nurse owes the same duties to self as to others, including the responsibility to preserve integrity, to maintain competence, and to continue personal and professional growth.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

The profession of nursing calls all nurses to be self-sacrificing in order to meet the needs of the patients, families, and communities we serve. But we must always remember that no one can give what they don't have. If your basic needs aren't met, you will not be able to be there for your patients.

Nurses aren't always good about reflecting on whether or not they have an optimal work–life balance. As a student, this can be as simple as making sure you are prepared and well rested before you arrive for clinical practice. This dilemma gets a bit more complicated if you are responsible for dependent children or adults. What if you are asked or mandated repeatedly to work an extra shift and your family is feeling short-changed? What happens in the rare event of a calamity? Envision an active shooter in your unit: Is your first responsibility to try to save your patients, or is it to take care of yourself? The pandemic made all these questions more than theoretical as every nurse working with patients with COVID-19 had to balance duties to these and other patients, family, and self.

A helpful exercise is to try to identify all the parties to whom you are responsible and then prioritize the parties. As a professional nurse, your patients and employer will definitely make it on to this list. But who gets your top priority? Patients? Your employer or team? Yourself? Your family?

Through the Eyes of a Nurse

Writing about a surgeon coercing a patient's wife to consent to a procedure she knew her husband didn't want; a nurse shared this narrative.

While it's easy to identify and place blame on the unethical actions of the cardiac surgeon, you cannot ignore those of the nurse—me. According to the ANA Code of Ethics Provision 3.5 in 2015, "[Nurses] must take appropriate action in all instances of incompetent, unethical, illegal, or impaired practice that place the best interests of the patient in jeopardy." I had that gut feeling in my stomach that what was occurring was unethical and a disservice to my patient. However, I did not fulfill one of my most important roles as a nurse, and that was to be an advocate to my patient. I should have expressed my concern to the surgeon about what had occurred as well as management. While it may have been uncomfortable and intimidating to stand up to those authority figures, without acknowledging and bringing to light this scenario, a similar injustice could happen to many others. Initiating an ethics consult would have been a great way to bring everybody together to focus on what the patient's wishes were and to support his wife as the surrogate decision maker so she could authorize a valid decision. It is now years later, my moral agency is enhanced, and were this incident to occur today, I believe there would be a totally different outcome.

–Megan Konopacke, RN

ADVOCACY IN NURSING PRACTICE

As bridges between vulnerable patients and the resources they need to secure health outcomes, nurses have always been strong patient advocates. **Advocacy** is the protection and support of another's rights. This role is increasingly important because of patients' changing expectations and demands, and because in our increasingly market-driven health care economy there are no guarantees that the health care system will work to secure patient safety and health. Provision 3 of the ANA Code of Ethics for Nurses with Interpretive Statements reads, "The nurse promotes, advocates for, and protects the rights, health and safety of the patient." Provision 8 obliges nurses to collaborate with other health professionals and the public to protect human rights, promote health diplomacy, and reduce health disparities (ANA, 2015). See the accompanying Through the Eyes of a Nurse.

The ANA declared 2018 the Year of Advocacy and featured examples of members advocating for patients and the profession in various roles and settings, highlighted at www.RNAction.org and distributed through various ANA digital and social media channels. The RNACtion is a website where you can sign up for latest updates and for opportunities to be involved in advocacy campaigns. The current advocacy campaigns include: Health care reform, nursing workforce development, gun violence, safe staffing, home health, workplace violence, and the opioid epidemic. What other advocacy issues would you like to see addressed? See the Nursing Advocacy in Action box in this and other chapters.

Nurses who value patient advocacy:

- Make sure that their loyalty to their employing institution or colleagues does not compromise their primary commitment to the patient
- Give priority to the good of the individual patient rather than to the good of society in general
- Carefully evaluate the competing claims of the patient's autonomy (self-determination) and the patient's well-being

When respecting autonomy, the nurse supports the patient's right to make decisions with informed consent (Chapter 7). When promoting the patient's well-being, the nurse acts in the best interests of the patient. Ideally, both autonomy and patient well-being are promoted in every nurse–patient interaction; however, conflicts sometimes arise.

Nursing Advocacy in Action

Patient Scenario

Mrs. Abigail Winthur is repeatedly asking the staff in your nursing home *not* to encourage her husband to eat. Mr. Winthur, age 88, has advanced Alzheimer disease. He seems to enjoy eating and has no difficulty swallowing, but an aide has to sit by Mr. Winthur and lift the spoon to his mouth and place his cup in his hand. If you merely put the tray in front of him, he will most likely not eat.

Mrs. Winthur reports that her husband would never want to live the way he is now and she is sure that he would refuse to eat if capable of doing so. She also states that society is going to have to decide what to do about all the people we are currently "warehousing." She seems to love her husband, but she is very open about the difficulty of having been his caregiver for 3 years. He had always been a gentle man, but then suddenly he became aggressive and would just as soon hit or punch her as take her hand. Your nurse colleagues are split: some believe Mrs. Winthur's request should be honored, but others are adamant that they and other nurses should at least try to feed a patient who can swallow and who seems to enjoy eating when someone is helping him.

Implications for Nursing Advocacy

How would you respond if you were Mr. Winthur's nurse? Talk with your classmates and experienced nurses about these questions:

- If you elect to advocate for Mr. and Mrs. Winthur, what practical steps can you take to ensure better health outcomes?
- What is it reasonable to expect of a student nurse, a graduate nurse, and an experienced nurse in this situation?
- What advocacy skills are needed to effectively respond to this challenge?

When **Mr. Zhang**, the 32-year-old man described at the beginning of the chapter, requests to be removed from the ventilator, the principle of autonomy demands respect for his treatment preferences at the same time that the principle of nonmaleficence obligates preventing the harm of his likely death. Nurses sensitive to the need to promote both patient autonomy and well-being may often experience conflict, but they are nonetheless more likely to succeed in securing the patient's genuine best interests.

Representing Patients

Most nurses would agree that much nursing time is spent representing patients' interests or guiding patients in protecting their own rights. The nurse is often involved as an intermediary between the patient and the family, especially when the patient and family have conflicting ideas about the management of health care situations. For example, a patient with terminal cancer tells his nurse that he wants to go home to die. The patient's family, however, tells the nurse that they cannot care for him at home. As an advocate, the nurse recognizes the rights of both the patient and his family. The nurse then works to help find a solution that benefits both the patient and the family. By informing the family of the availability of home care and hospice care, the nurse gives them information that may help satisfy the patient's desire for a dignified death (Fig. 6-3). Working alone, most people could not get the financial help needed for such care. Nurses have the resources available to help, and can arrange referrals from other health care workers, such as social workers, to achieve the desired outcomes.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

FIGURE 6-3. The nurse acts as a patient advocate in discussing all aspects of the patient's health care with the patient or designated surrogate.

Nurses may also serve as intermediaries between patients and the medical profession. Nurse ethicist Patricia Murphy (1990) documented a moving account of how nurses interceded for a 43-year-old woman with amyotrophic lateral sclerosis who was on a ventilator but wished to die. The patient's primary health care providers refused to help remove her from the ventilator, and more than 20 other health care providers declined to accept her as a patient when they learned what she wanted to do. After unsuccessful appeals for help to the county medical society and her own attorney, the patient's visiting nurse, working with a supportive social worker, contacted her state nurses' association and finally secured the assistance needed to help the patient achieve her goal of a dignified death.

Patients with special advocacy needs include those who are uninformed about their rights and opportunities, those with sensory impairment, those who do not speak the dominant language fluently or at all, the very young and the older adult, those who are seriously ill, those who are mentally or emotionally impaired, those with physical disabilities, and those who lack adequate financial or human resources.

Consider **Mr. Raines**, the 68-year-old man described at the beginning of the chapter. Advocacy for his special needs would be critical in developing his discharge care plan.

Promoting Self-Determination

Advocacy is linked to the belief that making choices about health is a fundamental human right that promotes the person's dignity and well-being. Ethical dilemmas may arise when people are unable or unwilling to make choices or when they are not given the opportunity to do so. Faulty communication among patients, family members, and caregivers frequently contributes to these dilemmas. Nurses have an important advocacy role in educating the public about the value of written advance directives (described in Chapter 44).

Nurses as advocates must realize that they do not make ethical decisions for their patients. Instead, they facilitate their patients' own decision making. Nurses interpret findings for their patients, provide information to be considered, help them verbalize and organize their feelings, call in those people who should be involved in the decision making (e.g., family, primary nurse, health care provider, or clergy), and help patients assess all of their options. In this way, nurses

advocate for the right of patients to make their own decisions concerning their health.

Not all individuals want to make their own treatment decisions, and nurses should not violate the spirit of autonomy (self-determination) by forcing the decision-making role on anyone. Nurses sometimes advocate for patients by helping them delegate decisions to a preferred decision maker whom they trust. In addition, when acting as a patient advocate, nurses must be careful to clarify exactly what it is that they mean by advocacy because, in most instances, this does not simply mean supporting patients in all of their preferences. For example, if a patient in the early stages of Alzheimer disease, with the support of her husband, asks a nurse for help in terminating her life, the nurse would have strong ethical grounds for refusing to advocate for that particular request.

Concept Mastery Alert

Advocacy supports decision making, but it does not involve making the decision for the patient.

Whistle-Blowing

Every nurse who witnesses unsafe care has a duty to patients to report it. However, for too long, nurses may have failed to speak up out of fear of retribution.

In 2009, Anne Mitchell and Vicki Galle, two long-time registered nurses at Winkler County Memorial Hospital in Kermit, Texas, were charged with violating the law by sending an anonymous letter to the state medical board that expressed concern about Dr. Arafiles, who practiced at the hospital. After receiving a complaint of harassment from the physician, the Winkler County Sheriff's Department investigated and filed criminal charges against both nurses that carried potential penalties of 10 years imprisonment and a fine of up to $10,000. Mitchell and Galle, who had a combined 47 years of employment at the hospital, were also fired from their positions.

Charges of misuse of official information against Galle were dropped. Mitchell endured a 4-day jury trial and was found not guilty. The nurses then filed a federal civil suit against their accusers alleging violation of civil rights, among other violations, and won a $750,000 settlement. The Texas attorney general's office ultimately indicted the hospital and the government officials who had originally accused the nurses of wrongdoing.

In 2011, Dr. Arafiles pleaded guilty and was sentenced to 60 days in jail and 5 years' probation, a $5,000 fine, and surrendering his medical license. The Winkler County sheriff, county attorney, and hospital administrator received jail sentences for their roles in trying to silence the two nurses who complained to the Texas Medical Board about Arafiles. As expressed by the ANA, "The criminal convictions of all those involved in prosecuting the nurses sends a powerful message: Those who retaliate against nurses who speak up in the interests of patients will be held accountable" (ANA, 2011).

Being Politically Active

Nursing has had a continuing voice in the political arena on behalf of those least well served by the health care system, including people who are homeless, minorities, women, and children. As the government becomes more involved in the delivery and funding of health care services, and as those designing rationing plans speak seriously of age and other variables as criteria for limiting care, nurses must continue to advocate for the health care needs of those least empowered to do so for themselves. Nurses are a powerful bloc of voters—3 million strong—whose potential for influencing health care legislation is growing. Recall that 2020 was a particularly contentious election year. Did you vote? What informed your vote? See Chapter 7 for helpful guides to contacting your legislative representatives.

Ethics and Academic Integrity

Before leaving this chapter, it's important to think carefully about your role as a student in an academic environment. It should go without saying that any school of nursing expects honesty; integrity; ethical behavior; and civility of all of its members, faculty, students, and staff. Charged with preparing the next generation of professional nurses who will inherit the mantle of being the most trusted professionals, nursing programs and educators are mandated to model and uphold rigorous standards of integrity. A recent Outlook and Perspective in *Nursing Outlook* (July/August 2020) noted that students cite the high pressure to succeed, an intensely competitive culture, and anxiety about the postgraduation job market as factors that push high-performers to cheat, plagiarize, or commit other dishonesty. Most telling is the evidence that those who act dishonestly as students may well carry over this behavior into their lives as working clinicians. So, if you find yourself tempted to cheat in order to get better grades, remember what is at stake: your own integrity, but also that of the profession and the well-being of those you profess to serve.

Final Note About Trustworthiness

Common to all of the standards discussed previously is the obligation for nurses to be competent and willing to use their competence to secure the health and well-being or good dying of the patient. Who you choose to be on any day you arrive for practice literally has the power to influence how people are born, live, age, suffer, and die. When you become aware that something is interfering with patients getting the care that they need, you are responsible for responding within the scope of your practice and responsibility. If you cannot independently resolve the problem, you are

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

responsible for alerting the appropriate party, who may be the attending health care provider, a nursing supervisor, or a medical director.

Although some nurses believe that "the problem is out of my hands" once they notify the next person in the chain of command, the problem remains theirs until appropriate action is taken. Thus, you should know and use the chain of command and continue to refer a problem upward until it is resolved and the patient's needs are met. Good professional nurses are competent, compassionate, collaborate advocates for patients, families, and communities. They are remembered for being and making the critical difference.

DEVELOPING CLINICAL REASONING AND CLINICAL JUDGMENT

. Each student who chooses nursing as a career does so for different reasons and based on different values. A desire to help others, a desire for a steady income, wanting a career that allows you to work anywhere at any time, a commitment to provide for your children's well-being, a love of science and technology, and respect for your parents' wishes are all values that may lead to you to choose nursing as a career.

- Interview your classmates and identify the values that brought everyone to nursing. When a classmate lists more than one value, ask that classmate to rank them in order of their importance. Compare your lists.
- Discuss which values, if any, provide the best motivation for professional nursing. Do you think that there are certain values that are incompatible with professional nursing and should be grounds for rejecting candidates for professional nursing?
- Make a judgment about how well your personal values equip you for professional nursing. Would your patients affirm your values? Are any modifications needed?

. Make a list of values that might positively or negatively influence someone's ability to lose weight. Think about how you could use this knowledge when counseling patients who are overweight.

. Another student tells you, "Who I am outside of school is no one's business and has no effect on my nursing." Do you agree? Why or why not?

. Using any current ethical issue (e.g., assisted suicide, how to allocate scarce organs for transplantation, everyone's right to health care), poll your classmates to identify a range of opinions among them. Reflect on what it is that causes people to reach different conclusions about what is the ethically right thing to do. How might you use this knowledge as you experience ethical conflict in your professional practice?

. You are observing a birth and hear the mother cry out in pain when the obstetrician starts suturing a tear after the delivery. You ask the obstetrician if she would like more lidocaine to numb the area, but she says the repair will not take long. The mother is now screaming each time she feels the needle puncture. How do you advocate for the patient? You have heard other nurses complain that this obstetrician frequently ignores the pain of Black patients.

. During an observation experience in the operating room, you see the scrub nurse break the sterile field and continue as if nothing happened. Your clinical instructor is not in the hospital, and you don't know where your OR preceptor is at this moment. What should you do? What will you do?

PRACTICING FOR NCLEX

. A nurse caring for patients in the intensive care unit develops values from their experiences when forming a personal code of ethics. Which statements correctly guide this process? Select all that apply.

a. People are born with values.
b. Values act as standards to guide behavior.
c. Values are ranked on a continuum of importance.
d. Values influence beliefs about health and illness.
e. Value systems are not related to personal codes of conduct.
f. Nurses should not let their values influence patient care.

. The parent of a young school-age child wants them to learn about healthy dietary choices related to diabetes. Which method of value transmission would be most helpful?

a. Depriving the child of their favorite toy when they consume foods not on their diet
b. Lecturing the child on the merits of healthy and unhealthy food choices
c. Allowing the child to experiment and discuss the outcomes on their blood glucose
d. Offering healthy meals and snacks and acting as a role model for healthful eating

. A nurse who is working in a hospital setting uses value clarification to help patients understand the values that motivate patient behavior. What patient actions help the nurse determine if they demonstrate "prizing" during this process? Select all that apply.

a. They stop smoking after a diagnosis of lung cancer.
b. They show off a new outfit that after losing 20 lb.
c. They choose to work fewer hours following a myocardial infarction.

d. They adopt a low-cholesterol diet.
e. They join a gym and schedule classes throughout the year.
f. They proudly display a certificate for completing a marathon.

. A nurse incorporates the "five values that epitomize the caring professional nurse" (identified by the American Association of Colleges of Nursing) into their home health care practice. Which attribute best reflects agreement with the code of ethics and accepted standards of practice?

a. Altruism
b. Autonomy
c. Human dignity
d. Integrity

. A nurse caring for patients in the city-run health clinic expresses a commitment to social justice. Working toward which action best exemplifies this attribute?

a. Providing honest information to patients and the public
b. Promoting universal access to health care
c. Planning care in partnership with patients
d. Documenting care accurately and honestly

. Nursing students are discussing the care-based approach to ethical practice. What actions will the students ensure are included in the discussion? Select all that apply.

a. Understanding that the needs of the many prevail versus the needs of the few
b. Promoting the dignity and respect of patients as people
c. Attending to the individual attributes of each patient
d. Cultivating responsiveness to others and professional responsibility
e. Understanding that moral skills include kindness, attentiveness, compassion, and reliability

. A patient with brain cancer questions whether they should agree to palliative radiation treatments despite possible memory loss, or enjoy their remaining time with friends and family. What is the most appropriate response by the nurse?

a. "I can't advise you. This is such an individual decision."
b. "If you receive the radiation, might you live a bit longer?"
c. "What does your family think you should do?"
d. "What is most important to you with the time you have left?"

. A hospice nurse is caring for a patient with end-stage cancer. Which action demonstrates the nurse's commitment to promoting the patient's autonomy?

a. Competently administering pain medication
b. Giving undivided attention when listening to patient concerns
c. Keeping a promise to obtain a counselor
d. Supporting the patient in obtaining a durable power of attorney

. A patient with an advanced directive and do-not-resuscitate order is sobbing and reporting severe pain. The nurse contacts the provider, who refuses to increase the medication dose due to the patient's hypotension. What actions would the nurse take next? Select all that apply.

a. Lodge a complaint with the state board of nursing
b. Consult with the ethics committee
c. Contact a different health care provider
d. Speak with the nurse manager
e. Request a palliative care consultation

. A nursing student is on clinical rotation in a long-term care facility. Which action best reflects the student acting as advocate?

a. Telling the health care team that a patient clearly stated they do not want to be transported to the hospital
b. Avoiding input in care conferences, as patient advocacy is primarily performed by the health care provider
c. Assisting the primary nurse in making good health care decisions for patients and residents
d. Deferring to whatever decisions patients and residents want

. At an interprofessional meeting, nurses discuss appropriate uses for an organizational ethics committee. Which referral do the nurses identify as appropriate?

a. Giving input into policies affecting work life balance

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

b. Providing interprofessional input on clinical care
c. Determining if the patient's cultural beliefs are valid
d. Advising the board of nursing on policy for licensure

. A patient with dysphagia has been admitted with a third episode of aspiration pneumonia in less than a year. The health care provider insists that for safety, the patient must have a feeding tube placed. The patient declines the tube and later asks the nurse if they should reconsider. What is the most appropriate nursing response?

a. "The feeding tube will prevent aspiration and is the safest option for you."
b. "You could swallow thickened liquids and puréed foods more easily."
c. "Tell me your understanding of what may happen without the feeding tube."
d. "You said cooking and dining with your family is important, and I understand your decision."

ANSWERS WITH RATIONALES

. **b, c, d.** A value is a belief about the worth of something, about what matters, that acts as a standard to guide our behavior. A value system is an organization of values in which each is ranked along a continuum of importance, often leading to a personal code of conduct. A person's values influence beliefs about human needs, health, and illness; the practice of health behaviors; and human responses to illness. Values guide the practice of nursing care. An individual is not born with values; rather, values are formed during a lifetime from information from the environment, family, and culture.

. **d.** Through modeling by observing parents, peers, and significant others, children learn what is of high or low value. When punishment is used to transmit values, children create negative associations with those values. Using lecturing and moralizing modes of value transmission, usually taught by parents or an institution (e.g., church or school), offers little opportunity for the child to weigh different values. Using a laissez-faire approach to value transmission, where no single set of values is presented as best, is not appropriate for a young child; this approach could permit permanent consequences of diabetes to develop.

. **b, f.** Prizing something you value involves pride, happiness, and public affirmation, such as losing weight or running a marathon. When choosing, you choose freely from alternatives after careful consideration of the consequences of each alternative, such as quitting smoking and working fewer hours. Finally, the person who values something *acts* on the value by combining choice and behavior with consistency and regularity, such as joining a gym for the year and following a low-cholesterol diet faithfully.

. **d.** The American Association of Colleges of Nursing defines integrity as acting in accordance with an appropriate code of ethics and accepted standards of practice. Altruism is a concern for the welfare and well-being of others. Autonomy is the right to self-determination, and human dignity is respect for the inherent worth and uniqueness of individuals and populations.

. **b.** The American Association of Colleges of Nursing lists promoting universal access to health care as an example of *social justice*. Providing honest information and documenting care accurately and honestly are examples of *integrity*, and planning care in partnership with patients is an example of *autonomy*.

. **b, c, d, e.** A care-based approach, essential to thoughtful, person-centered care, directs attention to the specific patient situation, viewed within the context of their life narrative. The care-based approach includes the following characteristics: centrality of the caring relationship; promotion of patient dignity and respect; attention to patient particulars; cultivation of responsiveness to others; professional responsibility; and redefinition of fundamental moral skills like kindness, attentiveness, empathy, compassion, and reliability. An action is right or wrong based on a rule, independent of its consequences, such as "the needs of the many outweigh the needs of the few."

. **d.** Advocacy is the protection and support of another's rights. The nurse assesses the patient's goals and advocates to support their wishes. Nurses do not make ethical decisions for patients; rather; the nurse facilitates patient decision making by interpreting and providing information, encouraging verbalization of feelings, and facilitating communication with family, primary nurse, health care provider, or clergy.

. **d.** The principle of autonomy obligates nurses to provide information and support patients' and their surrogates' need to make decisions that advance their interests. Acting with *justice* means giving each person their due, acting with fidelity involves keeping promises to patients, and acting with nonmaleficence means avoiding doing harm to patients.

. **b, d, e.** Ethical distress results from knowing the right thing to do but finding it almost impossible to execute due to institutional or other constraints (in this case, the nurse fears inability to collaborate with the provider). The nurse uses available resources such as seeking guidance from the nurse manager, attempting to secure a palliative care consult, and consulting the ethics committee. The state board of nursing does not regulate medical practice. The nurse does not circumvent the patient's health care provider.

. **a.** Advocacy is the protection and support of another's rights. Among the patients with special advocacy needs are the very young and the very old, those who are seriously ill, and those with disabilities. Patient advocacy is the responsibility of every member of the professional caregiving team—not just nurses. Nurse advocates do not make health care decisions for their patients and residents; rather, they facilitate patient decision making. Advocacy does not

entail supporting patients in all their preferences.

- **b**. The Joint Commission mandates that accredited facilities have a mechanism for addressing ethical problems. Health care institutions often have multidisciplinary ethics committees who provide case review and consultation and participate in education, policy making, quality, and (in some cases) research. Nurses contribute unique knowledge about the patient and family, interpret technical facts, identify appropriate decision makers, represent the patient's best interests, and help ensure the course of action is justified by sound ethical principles. Nurses play an important role in policy making, identifying needed policies to address ethical concerns or suggest needed modifications of existing policies. The human resource department focuses on employee policy; the health care team cannot judge or force a patient to reevaluate their cultural beliefs and observances.
- **c.** The nurse assesses the patient's understanding of the cause and consequences of aspiration and pneumonia. The nurse can provide further information on pneumonia and sepsis if needed, while supporting the patient's decision. The patient has already declined treatment; therefore, the nurse assesses whether the patient understands the decision before discussing the intervention. The nurse may suggest safer swallowing options or consultation with a speech therapist after assessing the patient's knowledge.

Legal Dimensions of Nursing Practice

Ramone Scott

Ramone, a 66-year-old man, had surgery to repair a fractured hip earlier in the day. His nurse just administered a dose of an intravenous antibiotic that had been prescribed for a different patient.

Meredith Bedford

Meredith is the mother of a terminally ill child with a brain tumor who is admitted to a residential hospice for better pain and symptom management. One morning she tells the nurse, “I’m very unhappy with the care my son is receiving. I’m going to talk with my attorney as soon as possible to press charges against the hospice.”

Ella Rodriguez

Ella, an 8-year-old girl, comes to the emergency department (ED) with a right forearm fracture. She requires diazepam sedation for a closed reduction procedure. The ED’s protocol for administration to a child states that a health care provider must be present throughout the entire sedation procedure. One of

the health care providers has been working his 14th hour, and the ED is overflowing. He orders the nurse to begin the sedation protocol, stating that he will be back in the room in 10 minutes.

Learning Outcomes

After completing the chapter, you will be able to accomplish the following:

. Define "law" and describe four sources of laws.
. Describe the professional and legal regulation of nursing practice.
. Identify the purpose of credentialing, using as examples accreditation, licensure or registration, and certification.
. Identify grounds for suspending or revoking a license or registration.
. Differentiate between intentional torts (assault and battery, defamation, invasion of privacy, false imprisonment, fraud) and unintentional torts (negligence).
. Evaluate personal areas of potential liability in nursing.
. Describe the legal procedure that occurs when a plaintiff files a complaint against a nurse for negligence.
. Describe the roles of the nurse as defendant, fact witness, and expert witness.
. Use appropriate legal safeguards in nursing practice.
. Explain the purpose of incident reports.
. Describe laws affecting nursing practice.

statutory law
tort
whistle-blowing

As the roles and duties of nurses have expanded, so has our legal accountability. In the past, many nurses worked under the supervision of a health care provider, few carried liability insurance, and even if a nurse's actions directly caused harm to a patient, the primary liability for the nursing action fell on the employing facility or health care provider. In modern practice, nurses assess and diagnose patients and plan, implement, and evaluate nursing care. Full legal responsibility and accountability for these nursing actions rest with the nurse. (See the accompanying Reflective Practice box for an example.) Nurses are increasingly the subjects of both civil and criminal negligence cases and are being brought to court to defend their practice. While nurses shouldn't practice in constant fear of being sued, it would be foolish not to learn how to be legally prudent. Similarly, many nurses do not appreciate the true extent of authority the nursing boards maintain and the issues they may address and consequently fail to take steps to maintain their license in good standing.

Although many nurses continue to work in traditional settings such as hospitals and long-term care facilities, more nurses are working in nontraditional community settings such as home care facilities, clinics, daycare centers, and nurse-managed health centers. Advanced practice nurses may have independent practices. It is critical for nurses to document their actions carefully and act in ways to prevent malpractice accusations. Nurses who wish to avoid legal conflicts need to develop trusting nurse–patient relationships (satisfied patients rarely sue), practice within the scope of their competence, and identify potential liabilities in their practice and work to prevent them. Nurses are less likely to be sued than other health care professional because they spend more time with patients and take time to answer their questions.

LEGAL CONCEPTS

As you begin professional practice, it is essential to understand how the law defines the nurse's legal responsibilities and duties.

Definition of Law

A **law** is a standard or rule of conduct established and enforced by the government that is intended chiefly to protect the rights of the public. Public law is law in which the government is involved directly. It regulates relationships between people and the government—for example, describing the powers of the government. Private law, also called civil law, regulates relationships among people. Civil law includes laws relating to contracts; ownership of property; and the practice of nursing, medicine, pharmacy, and dentistry. Criminal law, a type of public law, concerns state and federal criminal statutes, which define criminal actions such as murder, manslaughter, criminal negligence, theft, and illegal possession of drugs.

Sources of Laws

Four sources of laws exist at both the federal and state level: constitutions, statutory law, administrative law, and common law.

Constitutions

Federal and state constitutions indicate how the federal and state governments are created, and they give authority and state the principles and provisions for establishing specific laws. Although they contain relatively few laws (called constitutional laws), constitutions serve as guides to legislative bodies.

Statutory Law

A legislative body enacts **statutory law**. Statutory laws must be in keeping with both the federal constitution and the state constitution. Nurse practice acts are an example of statutory laws. These are discussed fully in the later section entitled "Professional and Legal Regulation of Nursing Practice."

Administrative Law

Executive officers (e.g., the President of the United States, state governors, and city mayors) administer facilities that, among other functions, are responsible for law enforcement. These facilities have the power to make administrative rules and regulations, in conformity with enacted law, that act as laws and are enforceable. Boards of nursing are administrative facilities at the state level. The rules and regulations that they adopt are administrative laws. An example of a municipal administrative facility is the city board of health.

QSEN Reflective Practice: Cultivating QSEN Competencies

CHALLENGE TO ETHICAL AND LEGAL SKILLS

This past summer, I worked in the emergency department (ED) of a very reputable hospital. Overall, I felt that the department was a desirable working environment and that the relationships between health care providers and nurses were very open. However, one incident occurred that I felt put the patient's safety at risk.

Ella Rodriguez, an 8-year-old girl, had come to the ED with a right forearm fracture. She required diazepam sedation for a closed reduction procedure. The ED's protocol for administration to a child states that a health care provider must be present throughout the entire sedation procedure. One of the health care providers had been working for 14 hours, and the ED was overflowing. He ordered the nurse to begin the sedation protocol, stating that he would be back in the room in 10 minutes. The nurse taking care of the patient was a new graduate and did not feel comfortable giving the drug alone, but also did not feel comfortable speaking up to the doctor. She proceeded to go into the room and inject the first dose of diazepam, against protocol.

This nursing action completely undermined the patient's safety because the nurse not only stated previously that she did not feel comfortable with the sedation procedure, but she also went against protocol. Since both the health care provider and the nurse had a duty to follow the protocol, if harm resulted from their failure to do so, there would be grounds for negligence. Although the health care provider was also responsible for giving the nurse orders against protocol, her obligation to herself and the patient should have been the priority, and thus, she should have refused to give the drug until the health care provider was in the room.

Thinking Outside the Box: Possible Courses of Action

- Hope that nothing happens to the patient until the health care provider comes back into the room.
- Get the health care provider back into the room; if he refuses an invitation to be present, report this to someone in a leadership position.
- Ask the nurse why she is violating protocol.
- Seek the help of my preceptor immediately.

Evaluating a Good Outcome: How Do I Define Success?

- Patient is benefited or at the very least not harmed.
- The health care provider, nurse, and unit leaders accept responsibility for safely implementing protocols.
- All health care team members demonstrate accountability for failures to adhere to protocols.
- Patient safety is put first, even when this means challenging other members of the team.

Personal Learning: Here's to the Future!

My preceptor, the charge nurse, realized that the nurse was in the room administering the medication. Once he realized this, he immediately got the health care provider to go into the patient's room. After the procedure was completed successfully, he discussed the implications of both the nurse's and the doctor's actions with each of them together and separately. I did not have time to respond to this incident because the charge nurse had acted so quickly and appropriately.

Obviously, I think that the nurse should have spoken to the health care provider and refused to give the medication, but I can understand her feelings, especially being a new graduate. The entire situation can be very intimidating, but as nurses, our responsibility is to the patient. By not standing up for the patient and herself, the nurse put the patient in danger and herself in danger, and did nothing to change the climate of the ED. The experienced and exceptionally capable charge nurse was not afraid to stand up to the doctor. Not only did his actions put the patient's safety first, but he also demonstrated to the nurse, myself, and other nurses that it is imperative that nurses stand up for themselves and patients.

I believe that no matter what the circumstance is, nurses need to stand up for themselves and their patients, especially now, when our health care climate yields to nurses' voices being heard. The only way that nurses' roles and reputations will change is if we, the nurses, speak up, and speak loudly. Right now, we have a unique opportunity to change the way medicine is practiced to benefit both patients and nurses. If all nurses grab this opportunity and make something of it, we can really make a difference, but it needs to be a collective effort to be successful. Regardless of how small the problem is, it must be addressed.

Julia Strobel, Georgetown University

QSEN SELF-REFLECTION ON QUALITY AND SAFETY COMPETENCIES DEVELOPING KNOWLEDGE, SKILLS, AND ATTITUDES FOR CONTINUOUS IMPROVEMENT

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

How do you think you would respond in a similar situation? Why? What does this tell you about yourself and about the adequacy of your skills for professional practice? How was the nurse's action ethical? Legal? Please explain. What other *knowledge, attitudes,* and *skills* do you need to develop to continuously improve the quality and safety of care for patients like Ella Rodriguez?

Patient-Centered Care: What role did each member of the nursing team play in creating a partnership with Ella's parents to best coordinate her care? What special talents do you bring to creating this partnership?

Teamwork and Collaboration/Quality Improvement: What communication skills do you need to improve to ensure that you function as a competent, caring, and responsible member of the patient-care team and that you obtain assistance when needed? How would you have responded if ordered by a health care provider to break protocol? What special talents do you bring to promoting a well-functioning interdisciplinary team?

Safety/Evidence-Based Practice: What priority did all involved in Ella's care accord to her health, well-being, and safety? What evidence in the nursing literature supports practicing as directed by this protocol? What in the safety literature dictates how nurses should respond in similar situations?

Informatics: Can you identify the essential information that must be available in Ella Rodriguez's electronic record to support safe patient care and coordination of care? Can you think of other ways to respond to or approach the situation?

Common Law

The government provides for a judiciary system, which is responsible for resolving controversies. It interprets legislation at the local, state, and national levels as it has been applied in specific instances and makes decisions concerning law enforcement. A body of law known as **common law** has evolved from these accumulated judiciary decisions. Common law is thus court-made law. Most law involving malpractice is common law.

Common law is based on the principle of *stare decisis,* or "let the decision stand." After a decision has been made in a court of law, the principle in that decision becomes the rule to follow in other similar cases. The case that first sets down the rule by decision is called a precedent. Court decisions can be changed, but only with strong justification. Common law helps prevent one set of rules from being used to judge one person and another set to judge another person in similar circumstances.

Court System

A lawsuit is a civil action brought in a court of law. **Litigation** is the process of bringing and trying a lawsuit. The person or government who claims to have incurred losses as the result of an action by a defendant is called the **plaintiff**. The **defendant** is presumed innocent until proved guilty of a crime or tort. Criminal law is concerned with actions that are harmful to society as a whole. A prosecutor or district attorney brings charges against a person, persons, or corporate entity believed to have committed a crime.

Recall **Meredith Bedford**, the mother of the terminally ill child threatening to bring charges against the hospice. The mother would be considered the plaintiff, while those named in the lawsuit would be considered the defendants.

The two levels of courts in the United States are trial courts and appellate courts. The trial court, the first-level court, hears all the evidence in a case and makes decisions based on facts, usually through a jury. The appellate court hears only cases questioning a point of law decided by the trial court. No witnesses testify at the appellate court level. The opinions of appellate judges are published and become common law.

PROFESSIONAL AND LEGAL REGULATION OF NURSING PRACTICE

Nurses who practice safely respect both the voluntary and legal controls of nursing practice. Both controls are designed to ensure quality health care and to protect society from unsafe actions. Take time to study the ANA Model Representing Regulation of Professional Nursing Practice, which depicts the components and relationships of the key regulatory influencers governing nursing practice:

- Evidence
- Nursing Practice
- Key Regulatory Influencers
- Code of Ethics, Nursing Professional Scope and Standards, and Specialty Certification
- Practice Setting, Organizational Policies, and Procedures
- Nurse Practice Acts, Rules and Regulations, Population Focus, Consensus Model
- Safety
- Quality (ANA, 2021, pp. 38–42)

Nurse Practice Acts

Your state's nurse practice act is the most important law affecting your nursing practice. Each state has a **nurse practice act** that protects the public by broadly defining the legal scope of nursing practice. Remember from Chapter 1 that the scope of nursing practice describes the "who," "what," "when," "where," "why," and "how" of nursing practice. You should obtain a copy of this act from your State Board of Nursing and study it carefully. Visit the website of the National Council of State Boards of Nursing (NCSBN) for more information about nurse practice acts and how to contact your State Board of Nursing (https://www.ncsbn.org/boards.htm). Each nurse is expected to care for patients within defined practice limits. Practicing beyond those limits (e.g., performing an appendectomy) makes you vulnerable to charges of violating the state nurse practice act.

Table 7-1 Who Makes Nursing Practice Rules?

SOURCE OF PRACTICE RULES	EXAMPLES OF ISSUES COVERED	WHERE RULES ARE DOCUMENTED	HOW TO INITIATE CHANGE
Federal legislation	• Medicare and Medicaid provisions related to reimbursement for nursing services	• Federal statutes	• Review documents • Draft desired legislative changes • Obtain support of colleagues, nursing organizations, other health care providers, and the public, if appropriate • Obtain support and sponsorship from a U.S. congressperson or senator, who will introduce the bill • Lobby for the bill's passage
State legislation	• Scope of practice for RNs, LPNs, advanced practice nurses • Nursing educational requirements • Composition and disciplinary authority of board of nursing	• Nurse practice act • Medical practice act • Other statutes	• Review documents • Draft desired legislative changes • Obtain support of colleagues, nursing organizations, other health care providers, and the public, if appropriate • Obtain support and sponsorship from a state legislator, who will

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

			introduce the bill • Lobby for the bill's passage
Board of nursing	• Delegation • Medication administration • Unprofessional conduct • Licensing	• Rules and regulations • Position statements • Declaratory rulings (as found in meeting minutes or newsletters), which may be specific to a particular setting or institution	• Review documents • Initiate a formal query to the licensing board • Obtain board support for change • The board may issue a position statement or declaratory ruling or hold a formal public hearing before voting to promulgate new rules or change existing ones
Health care institution	• Clinical procedures, such as wound dressing changes • Policies specific to the institution, specialty, or practice setting • Personnel and employment policies	• Unit-based policies • Institutional policies • Institutional credentialing policies	• Review institutional policies • Follow institutional policies or the chain of command to make inquiries or propose change

Consider **Ella Rodriguez**, the 8-year-old with the fractured arm requiring administration of sedation based on a protocol. The nurse should integrate knowledge of the state's nurse practice act when administering the medication, understanding the need to adhere to the ED's protocol that requires a health care provider to be present throughout the administration.

Nurse practice acts list the violations that can result in disciplinary actions against a nurse and also intend to prevent untrained or unlicensed people from practicing nursing. Table 7-1 illustrates different sources of rules affecting nursing practice, examples of issues covered, where these rules are documented, and suggestions for initiating change. More than 3.9 million U.S. nurses have great potential to influence health care if we would only contact our representatives and "raise our voices." To get what we want, we must make sure our legislators hear us loud and clear. What easier way to do this than with a letter or e-mail? An example of an e-mail to a member of Congress to support funding for the Nurse Reinvestment Act (NRA) is shown in Box 7-1 (on page 148), and a student describes a lobbying experience in Through the Eyes of a Student (on page 148).

Standards

Voluntary standards, developed and implemented by the nursing profession itself, are not mandatory but are used as guidelines for peer review. Professional nursing organizations continually reassess the functions, standards, and qualifications of their members. These organizations are guided by their own assessment of society's need for nursing and by the public's expectations of nursing. Examples of voluntary standards include the American Nurses Association (ANA) standards of practice (see Chapter 1; ANA, 2021), professional standards for the accreditation of education programs and service organizations, and standards for the certification of individual nurses in general and specialty areas

of practice. The ANA (2021) describes the Standards of Professional Nursing Practice as authoritative statements of the duties that all registered nurses, regardless of role, population, specialty, setting or Advanced Practice Registered Nurse foci, are expected to competently perform.

Box 7-1 **Example of an E-Mail to Congress to Support Funding for the Nurse Reinvestment Act (NRA)**

Explanation of Numbered Points

1. Use your Congress member's e-mail address, which can be found at http://www.house.gov and http://www.senate.gov. Send an individual e-mail to each member of Congress separately, with only one e-mail address in the "To:" line. You may want to send an e-mail to the member who represents voters from the place where you work, if you live in a different state or district from where you work. If you do this, be sure to write the e-mail to describe the impact that the legislation will have on your patients, who are the legislator's constituents.
2. You can copy this e-mail to a professional nursing organization or leave this blank. Do not copy it to another member of Congress.
3. State as clearly as possible the legislation you are addressing (e.g., nursing shortage). Although not necessary, you can use the bill number, if known.
4. If you want to attach a letter you have written that is longer and more fully explains your position, you may do so here.
5. An e-mail needs to be shorter and more succinct than a letter. The person reading it should be able to view your entire message on one screen without scrolling down. If you want to write more, attach a letter.
6. Put your name and address at the top to show the legislator that you are a voter in their district or state.
7. The legislator's title—either "Representative" or "Senator"—and last name make up the salutation.
8. Body of the e-mail:
   - State what you want the legislator to do in the first sentence.
   - Identify yourself as a concerned nurse.
   - Tell why the legislator should do what you are asking.
   - Ask the legislator to vote for/support what you are asking.

Finally, use spell-check and reread the e-mail to make sure the message you want to get across is clear and concise.

Source: Used with permission. Sharp, N. (2003). The "write stuff." Nursing Spectrum, *13*(2), 12–13.

Legal standards, on the other hand, are developed by a legislature and are implemented by authority granted by the state to determine minimum standards for the education of nurses, to set requirements for licensure or registration, and to decide when a nurse's license may be suspended or revoked. Examples of legal standards include state nurse practice acts and rules and regulations of nursing.

Through the Eyes of a Student

I was extremely nervous to go to Capitol Hill and meet with my congressional representative; I had begun to feel so comfortable in my scrubs at the hospital that I felt out of place in a suit. I was very fortunate that Representative Christopher Shays agreed to meet with me to discuss my views on medical malpractice liability. Although the meeting was very short, Mr. Shays gave me his attention and respect and listened to my point of view and that of the ANA with political tact. He said that he appreciated my taking time to meet with him and share my views on the subject as a voter and student nurse. He found the issue to be especially important in Connecticut because our state is currently facing crises in regard to high medical malpractice insurance rates and a large number of health care providers having to end their practice because of these rates. Mr. Shays shared his belief that it is critical to reform medical malpractice to provide quality, affordable health care. He explained his view that excessive jury awards have driven the cost of health care up for everyone, and that he believes a noneconomic damage cap of $250,000 will help in containing health care costs and make insurance more affordable to Americans. I was able to reiterate the ANA's view of postponing judgment on the institution of a medical malpractice cap until an impartial commission could complete and release a report on the effect of the controversial topic, helping him to make an informed decision. I thanked Mr. Shays for his time, and he thanked me for sharing my views on the subject and wished me luck in my study of such a "noble profession." It was thrilling to talk to Mr. Shays, if only briefly, and to feel like such an important part of the legislative process. Nurses definitely have the power to impact our nation's health care legislation.

—Maureen McFadden, Georgetown University

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Credentialing

Nursing has taken several steps to ensure the competence of its health care providers, including the credentialing process. **Credentialing** refers to ways in which professional competence is ensured and maintained.

Three processes are used for credentialing in nursing. The first is **accreditation**, which is the process by which an educational program is evaluated and recognized as having met certain standards. The second is **licensure**, which is the process by which a state determines that a candidate meets certain minimum requirements to practice in the profession and grants a license to do so. The third is **certification**, which is the process by which a person who has met certain criteria established by a nongovernmental association is granted recognition in a specified practice area.

Accreditation

State constitutions give states a responsibility for the public welfare. State legislative bodies have used this principle to enact laws controlling occupational and professional groups. One function of these laws is to see that schools preparing health care providers maintain minimum standards of education. Nursing, like most other health care professions, operates under state laws that promote the general welfare by determining minimum standards of education through accreditation of schools of nursing. State-approved, or accredited, educational programs in nursing include practical or vocational, associate degree, diploma, baccalaureate, and graduate programs in nursing (see Chapter 1).

Legal accreditation of a school preparing nursing personnel by the State Board of Nursing is different from voluntary accreditation. The National League for Nursing Accrediting Commission (NLNAC) and the American Association of Colleges of Nursing (AACN) are voluntary facilities that accredit schools when they meet certain criteria. Most schools choose to seek this voluntary accreditation, and many prospective students prefer selecting accredited schools. Accreditation by NLNAC or AACN is not a legal requirement for a school to exist; state accreditation is a legal requirement.

Licensure

Licensure is a specialized form of credentialing based on laws passed by a state legislature. A license is a legal document that permits a person to offer to the public skills and knowledge in a particular jurisdiction, where such practice would otherwise be unlawful without a license. Licensure is discussed in Chapter 1. In addition to successfully completing an accredited nursing program of study and passing the National Council Licensure Examination (NCLEX), to maintain a license in good standing a nurse must meet other requirements as determined by the state or territory. These requirements typically include good moral character, continuing clinical competence or continuing education, the absence of a criminal record, English proficiency, and compliance with specific provisions of the state's nursing laws. Some states require criminal background checks. It is critical to remember that licensure is not a constitutional right, it is a revocable privilege. As many nurse attorneys are quick to point out the licensing board is there to protect the public not to be an advocate for you. See the National Council of State Boards (NCSBN) website (https://www.ncsbn.org) for answers to your questions about licensure. The NCSBN also offers a video for new nurses about licensure, available at https://www.ncsbn.org/8243.htm.

According to the NCSBN, a mutual recognition model of nurse licensure allows a nurse to have one license in their state of residency and to practice in other states (both physically and electronically) as well, subject to each state's practice law and regulation, unless otherwise restricted. This multistate nurse licensure model is governed by the Nurse Licensure Compact (NLC). All states that currently belong to the NLC also operate the single-state licensure model for those nurses who reside legally in an NLC state but do not qualify for multistate licensure. *You must legally reside in an NLC state to be eligible for a multistate license.* For questions related to the multistate license or privilege to practice, contact the Board of Nursing in your state of residence (https://www.ncsbn.org/nlc.htm).

Once earned, a license to practice is a property right and may not be revoked without due process. This includes notice of an investigation, a fair and impartial hearing, and a proper decision based on substantial evidence. Crucial to a nurse's successful defense are early legal counsel, character, and expert witnesses and thorough preparation for all proceedings. Since legal counsel can be expensive, it is important to have your own liability insurance, as your employer's coverage does not address this.

State Boards of Nursing may revoke or suspend a nurse's license or registration for various reasons. Drug or alcohol use or misuse is currently the most frequent reason. You may be surprised to learn that sleep deprivation may result in disciplinary action. Other reasons for revocation or suspension of a license or registration include fraud, deceptive practices, criminal acts, previous disciplinary action by other state boards, gross or ordinary negligence, and physical or mental impairments, including those resulting from aging.

Certification

Whereas licensure measures entry-level competence, certification validates specialty knowledge, experience, and clinical judgment. Nursing certification is offered by many U.S. professional organizations, including two primary organizations: the American Association of Critical-Care Nurses, which represents the specialty with the largest number of certified nurses, and the American Nurses Credentialing Center (https://www.nursingworld.org/ancc/), a subsidiary of ANA, which began certifying nurses in 1974. The latter is the largest and most prestigious nurse credentialing

organization in the United States and has certified more than a quarter million nurses since 1990. Although certification, which involves special testing, is voluntary, nurse specialists are increasingly becoming certified.

Certification is one means to demonstrate advanced proficiency and a commitment to ensuring competence in the context of the current U.S. health care crisis, evidenced by daily reports of unsafe care, rising litigation, escalating costs, and a worsening nursing shortage.

Concept Mastery Alert

Nursing deals with the public. Thus, the ultimate goal of all laws and professional regulations involved with nursing practice is public safety.

CRIMES AND TORTS

A wrong committed against a person or that person's property may be categorized as a crime or a tort, or sometimes both. A **crime** is a violation punishable by the state, whereas a **tort** is subject to action in a civil court with damages usually being settled with money. By its very nature, a wrong tried as a crime is considered a more serious offense, with more legal implications, than a tort.

Crime

Though there may only be one victim of a crime, criminal acts are considered to be against the public as well. In a criminal case, the government, called "the people," prosecutes the offender. When a crime is committed, the factor of intent to commit wrong is present in most cases. Nonetheless, people who break certain laws are guilty of a crime regardless of whether they intended it. For example, failure to observe the Federal Food, Drug, and Cosmetic Act may constitute a crime.

Criminal law is in most cases statutory law (e.g., Federal Controlled Substance Acts and kidnapping laws or state criminal codes that define murder, manslaughter, criminal negligence, rape, fraud, illegal possession of drugs, theft, assault, and battery); only infrequently is it common law. Examples of common law are informed consent and the right to refuse treatment. Crimes are further classified as misdemeanors or felonies. A **misdemeanor** is a less serious crime, commonly punishable with a fine, imprisonment for less than 1 year, or both, or with parole. A **felony** (e.g., rape, murder) is punishable by imprisonment in a state or federal penitentiary for more than 1 year.

Torts

Torts may be intentional or unintentional acts of wrongdoing. Some of the intentional torts for which nurses may be held liable include assault and battery, defamation of character, invasion of privacy, false imprisonment, and fraud. A person committing an intentional tort is considered to have knowledge of the permitted legal limits of their words or acts. Violating these limits is grounds for prosecution. For example, although a policy specifies that a nurse may use restraints to protect an incompetent patient, restraining a competent patient to administer medications forcefully while the patient is refusing is assault and battery. Unintentional torts are referred to as negligence. A nurse who fails to initiate proper precautions to prevent patient harm (e.g., falls, skin breakdown) is subject to the charge of negligence. The nurse may not intend to cause harm; nevertheless, harm results.

An act that is a tort may also be a crime. For example, gross negligence demonstrating that the offender is guilty of complete disregard for another's life may be tried as both a civil and criminal action. It is then prosecuted under both civil and criminal law.

Intentional Torts

ASSAULT AND BATTERY

Assault is a threat or an attempt to make bodily contact with another person without that person's consent. **Battery** is an assault that is carried out and includes willful, angry, and violent or negligent touching of another person's body or clothes or anything attached to or held by that other person. Forcibly removing a patient's clothing, administering an injection after the patient has refused it, and pushing a patient into a chair are all examples of battery. Threatening to do any of these actions if the patient does not cooperate is assault. If an aggressive patient threatens harm, only actions necessary for self-protection or the aid of another are permitted.

Every person has the right to be free from invasion of their person, and adult patients who are alert and oriented have the right to refuse any treatment. The fact that treatment is desirable does not allow the nurse or health care provider to proceed without the consent of the patient or to go beyond the limits to which the patient has consented (see "Informed Consent or Refusal" within "Legal Safeguards for the Nurse").

DEFAMATION

Defamation of character is an intentional tort in which one party makes derogatory remarks about another that diminish the other party's reputation. *Slander* is spoken defamation of character; *libel* is written defamation. Defamation

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

of character is grounds for an award of civil damages. Damages are awarded to the plaintiff based on the amount of harm done to the plaintiff. Nurses who make false or exaggerated statements about their patients or coworkers run the risk of being sued for slander or libel. A person charged with slander or libel may be found not liable if it can be proved that the statement was made not to injure another but was made for a nonmalicious, justifiable purpose.

INVASION OF PRIVACY

The U.S. Supreme Court has interpreted the right against invasion of privacy as a constitutional right. The Fourth Amendment gives citizens the right of privacy and the right to be left alone. State courts have also strongly protected a patient's right to have information kept confidential. What is *confidential*? All information about patients is considered private or confidential, whether written on paper, saved on a computer, or spoken aloud. This includes patient name and all identifiers, such as address, telephone number, e-mail address, Social Security number, and any other personal information. It also includes the reason that the patient is sick or in the hospital, office, or clinic, the treatments the patient receives, and information about past health conditions. Protected health information may be found in the patient medical record, computer systems, telephone calls and voice mails, fax transmissions, e-mails that contain patient information, and conversations about patients between clinical staff.

The Health Insurance Portability and Accountability Act (HIPAA) was finalized in 2002. Most facilities now require workers to undergo HIPAA training and to review and sign a confidentiality agreement when hired and at each performance review. As a student in a health care setting, you should discuss privacy guidelines with your instructor and nurse mentors. HIPAA ensures that patients have the following rights:

- To see and copy their health record
- To update their health record
- To request correction of any mistakes
- To get a list of the disclosures a health care institution has made independent of disclosures made for the purposes of treatment, payment, and health care operations
- To request a restriction on certain uses or disclosures
- To choose how to receive health information

If a health institution wants to release a patient's health information for purposes other than treatment, payment, and routine health care operations, the patient must sign an authorization. Box 20-2 in Chapter 20 gives a list of permitted disclosures of patient health information and incidental disclosures. Other disclosure of confidential information, such as inappropriately discussing a patient's problem with a third party, may be construed as invasion of privacy and may subject the nurse to liability. The nurse's intimate knowledge of the patient increases legal risk in this regard.

The doctrine of privileged communication specifies that people in a protected relationship, such as a doctor and patient, cannot be forced, even during legal proceedings, to reveal communication between them unless the person who benefits from the protection agrees to it. State laws determine which relationships are protected by the privilege doctrine, and not all states privilege nurse–patient communication.

HIPAA includes punishments for anyone caught violating patient privacy: Those who do so for financial gain can be fined as much as $250,000 or be jailed for up to 10 years. Even accidentally breaking the rules can result in penalties—and embarrassment—for you and your organization.

Certain acts by nurses could constitute invasion of privacy, as the following examples illustrate:

- Unnecessary exposure of patients while moving them through a corridor or while caring for them in rooms they share with others
- Talking with patients in rooms that are not soundproof
- Discussing patient information with people not entitled to the information (e.g., with the patient's employer or the press, or even the patient's family if not authorized to do so)
- Pressing the patient for information not necessary for care planning
- Interacting with the patient's family in ways not authorized by the patient
- Using tape recorders, dictating machines, computers, and the like without taking precautions to ensure the patient's confidentiality (see Chapter 20 and Box 7-2)
- Preparing written or oral class assignments about patients without concealing their identity
- Carrying out research without taking proper precautions to ensure the anonymity of patients

Cybersecurity has become a top priority for all health care systems. Finn and Dion (2017a) recently wrote, "Just as nurses have been on the front lines of fighting disease and illness, they are now combatting cybercriminals trying to rob our patients of privacy, personal information, and identities. More than ever, nurses are required to perform a task—provide information security—that falls well outside their job description and for which they receive little training." Finn and Dion quote past ANA president Pamela Cipriano, "Nurses' ethical practice commands the safeguarding of a patient's right to privacy and confidentiality including their data and information. By being vigilant and using best practices to secure devices and the flow of information, nurses protect patients and maintain their trust." Jordan (2020) urges nurses to be aware of the most common types of attacks to improve our ability to recognize, avoid, and respond to them to protect ourselves, our coworkers, the organization, and—of course—our patients.

Box 7-2 **Privacy and Confidentiality of Health Care Records**

Security measures that a nurse should be aware of, particularly when using computerized health care records, include the following:

- Authorized users of an automated information system should have individual passwords and identification codes that are changed frequently. Nurses should never allow anyone else to use their log-on ID, nor should they perform any function using another person's log-on ID.
- Terminals, including those at the point of care, should have key locks as an additional measure to prevent unauthorized access to data.
- The computer system should "time out" when not in use for a specific period. The authorized user then needs to reenter the password and identification code to regain access.
- Nurses should log off the system when they leave a workstation and take other reasonable measures to ensure that unauthorized users cannot view or access confidential information.
- Temporary employees, such as traveling nurses, should have temporary passwords assigned.
- Employees who leave the organization should have their passwords and IDs terminated.
- The system should be able to track which users viewed, deleted, or updated patient information.
- Some information, such as results of acquired immunodeficiency syndrome testing, should not be stored on a computer.
- Computer printouts must be discarded appropriately because they may contain sensitive data about a patient.
- Nurses should not copy or provide data, either in printed or machine-readable form, for themselves or anyone else except as required to fulfill the responsibilities of their jobs.
- Most nurses sign agreements that they will use Internet access only to perform the responsibilities of their job. Internet access is not to be used for non–job-related business.
- The organization should have a policy regarding the use of patient data in research. Patient identifiers should be removed before the data are analyzed.
- Every nurse must be aware of the laws and statutes that protect the confidentiality of medical records. Most states have guidelines on the sharing of medical information. Your State Board of Nursing may revoke your license for serious breaches of patient confidentiality.

Protecting the privacy and confidentiality of health care records is the duty of every nurse. Any nurse who is aware of an actual or suspected breach of confidentiality must report it.

At times, a person's right to privacy may conflict with other rights, such as the public's right to information. When in doubt about disclosing confidential information, consult the nursing supervisor, ethics committee, or public relations department of the institution.

FALSE IMPRISONMENT

Unjustified retention or prevention of the movement of another person without proper consent can constitute false imprisonment. For example, only a reasonable amount of restraint should be used in circumstances that warrant it. The indiscriminate and thoughtless use of restraints on a patient can constitute false imprisonment. Springer (2015) cautions that restraints must not be used for coercion, punishment, discipline, or staff convenience. Serious sanctions by the state health department, The Joint Commission, or both, may result from improper restraint use. Be sure to check your institution's restraint policy before attempting to restrain any patient.

A person cannot be legally forced to remain in a health facility, such as a hospital, if that person is of sound mind, even when health care providers believe that the person should remain for additional care. Health facilities have special forms to use when a patient insists on being discharged against medical orders. The patient signs to indicate not holding the facility responsible for any harm that may result from leaving. People who are mentally ill may be committed to a psychiatric institution for treatment without their consent (involuntary commitment) only when it can be proved that they may be harmful to themselves or others.

FRAUD

Fraud is willful and purposeful misrepresentation that could cause, or has caused, loss or harm to a person or property. Misrepresentation of a product is a common fraudulent act. A person fraudulently misrepresenting themself to obtain a license to practice nursing may be prosecuted under the state's nurse practice act. Also, misrepresenting the outcome of a procedure or treatment may constitute fraud. Nurses who report vital signs or other assessment data that they have not obtained are acting fraudulently.

Unintentional Torts

NEGLIGENCE AND MALPRACTICE

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Negligence is defined as performing an act that a reasonably prudent person under similar circumstances would not do or, conversely, failing to perform an act that a reasonably prudent person under similar circumstances would do. As the definition implies, an act of negligence may be an act of omission or commission. **Malpractice** is the term generally used to describe negligence by professional personnel. Reising (2012) identifies the following common categories of malpractice claims:

- *Failure to follow standards of care*. EXAMPLE: You fail to follow the standards for administering insulin or other injectable medications.
- *Failure to use equipment in a responsible manner*. EXAMPLE: You attempt to use a bariatric patient lift for the first time without getting help, and the patient falls.
- *Failure to assess and monitor*. EXAMPLE: You fail to follow your hospital's standards for postoperative assessments after receiving a patient from the operating room, and response to a ruptured suture line is delayed.
- *Failure to communicate*. EXAMPLE: You fail to communicate your concerns about an older adult patient being discharged home; this patient lives alone. The patient is soon rehospitalized because no provisions were made to secure the nursing care needed after discharge.
- *Failure to document*. EXAMPLE: You believe a patient is in danger of arresting, but your repeated calls to a health care provider to see the patient are ignored, so you work up the chain of command. Before any health care provider sees the patient, he arrests and, despite a code, dies. You document the arrest, code, and death; however, you failed to document all the steps you took to get the patient the medical attention he needed. Sixteen months later, the family sues, and you try to remember what action you took that evening—most of which was never recorded.
- *Failure to act as a patient advocate or to follow the chain of command*. EXAMPLE: You are in the operating room and watch a surgeon break the sterile field twice. No one else seems to notice. You are intimidated by this surgeon and fail to bring this to anyone's attention. You learn that the patient developed a serious infection postoperatively.

ELEMENTS OF LIABILITY

Liability involves four elements that must be established to prove that malpractice or negligence has occurred: duty, breach of duty, causation, and damages. *Duty* refers to an obligation to use due care (what a reasonably prudent nurse would do) and is defined by the standard of care appropriate for the nurse–patient relationship. *Breach of duty* is the failure to meet the standard of care. *Causation*, the most difficult element of liability to prove, shows that the failure to meet the standard of care (breach) actually caused the injury. *Damages* are the actual harm or injury resulting to the patient. Examples of these four elements are presented in Table 7-2.

STANDARDS OF CARE

Whether negligence has occurred depends on a standard of care: what a reasonably prudent person would or would not have done under similar circumstances. All nurses are responsible for following the standards of care for their particular areas of practice. For example, labor and delivery nurses must understand how standards for nursing practice differ from those for medical obstetric practice (according to the state's nurse practice act); must be familiar with specific standards for obstetric nursing (e.g., Association of Women's Health, Obstetrics, and Neonatal Nursing [AWHONN]); and must carry out the nursing responsibilities detailed in the hospital's policies and procedures and in their job description. If hospital policy dictates an assessment of each patient in the early stages of labor every 30 minutes, for example, nurses must adhere to this standard unless they document a reason for doing otherwise.

Table 7-2 Proof of Malpractice

An example of how a plaintiff (person bringing the lawsuit) proves that the nurse defendants are guilty of malpractice.

ELEMENT	EXAMPLE
Duty	Hospital staff nurses are responsible for: • Accurate assessment of patients assigned to their care • Alerting responsible health care professionals to changes in a patient's condition • Competent execution of safety measures for patients
Breach of duty	• Failure to note and report that an older adult patient assessed as alert on admission is exhibiting periods of confusion • Failure to execute and document use of appropriate safety measures (e.g., upper and lower bedside rails, use of restraints if necessary, assisted ambulation)

Causation	• Failure to use appropriate safety measures; this failure causes the patient to fall while attempting to get out of bed, resulting in a fractured left hip
Damages	• Fractured left hip, pain and suffering, lengthened hospital stay, and need for rehabilitation

Table 7-3 (on page 154) lists areas of potential liability associated with each of the ANA standards of clinical nursing practice. Nursing errors can result in serious outcomes for the patient, as these examples show. To read more about standards, see Chapters 13 and 18.

Malpractice Litigation

When a patient believes they have been injured because of the negligence of a nurse or other health care professional and pursues legal action, one of three outcomes usually occurs:

- All parties work toward a fair settlement.
- The case is presented to a malpractice arbitration panel (in the United States).
- The case is brought to trial court.

The steps involved in malpractice litigation are as follows:

. The basis for the claim is determined to be appropriate and timely; all elements of liability are present (duty, breach of duty, causation, and serious damages).
. All parties named as defendants (nurses, health care providers, health care facility), as well as insurance companies and attorneys, work toward a fair settlement.
. The case is presented to a malpractice arbitration panel. The panel's decision is either accepted or rejected, in which case a complaint is filed in trial court.
. The defendants contest allegations (argue that there is no basis for alleging deviation from the appropriate standard of care or for proving causation and damages).
. Pretrial discovery activities occur: review of medical records and depositions of plaintiff, defendants, and witnesses.
. Trial takes place; both sides present their evidence and arguments.
. Decision or verdict is reached by the judge or jury.
. If the verdict is not accepted by both sides, it may be appealed to an appellate court.

The nurse may be involved in legal proceedings as a defendant, a fact witness, or an expert witness. For a tangible illustration of how the legal process operates, you and your class may want to implement the malpractice lawsuit simulation developed by Jenkins and Lemak (2009). See also Starr (2020), "You've been sued" and Brous articles on the elements of a nursing malpractice case (2019b, 2019c, 2020).

NURSE AS DEFENDANT

A nurse who is named a defendant should work closely with an attorney while preparing the defense. The attorney representing the nurse's interests is secured by either the nurse (if carrying personal liability insurance) or the employing facility. Recommendations for the nurse defendant include the following:

- Do not discuss the case with anyone at your facility (exception for the risk manager), with the plaintiff, with the plaintiff's lawyer, with anyone testifying for the plaintiff, or with reporters.
- Do not alter the patient's records. Tampering with a chart is the worst mistake you can make; you may well ruin your defense.
- Cooperate fully with your attorney. Do not hide any information from the attorney. Make sure you are fully prepared before you go on the witness stand.
- Be courteous on the witness stand. Do not volunteer any information.

NURSE AS FACT WITNESS

Either the defense or the prosecuting attorney may call a nurse who has knowledge of the actual incident prompting the legal case to testify as a **fact witness**. Fact witnesses, who are placed under oath, must base their testimony on only firsthand knowledge of the incident and not on assumptions. The nurse will be asked if the testimony is based on independent recollection of the incident or on documentation in the patient record. The nurse may testify, "I do not remember Ms. Jones, but I see from review of her record that I cared for her on the evenings of June 10, 13, 14, and 17." When in doubt about facts, the nurse should simply testify, "I do not remember that." New research into memory is showing that people often remember things differently from the way they were; this challenges the value of eyewitness memory. Thus, accurate documentation remains the nurse's best defense.

Table 7-3 Areas of Potential Liability for Nurses

AREAS OF POTENTIAL	EXAMPLES

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

LIABILITY	
Standard I: Assessment The registered nurse collects pertinent data and information relative to the health care consumer's health or the situation. • Incomplete database obtained (occurs frequently when patient is too ill at admission to respond to questions) • Significant omissions or errors in recorded database • Failure to note in the patient's care plan (and to execute) the need for more frequent nursing assessments • Failure to recognize and to report significant changes in the patient's condition	• Child too weak to be weighed on admission; chart contains no record of patient's weight; dosage of postoperative antibiotic therapy (which should be calculated on child's weight) too small to prevent infection; abscess develops • Nurse fails to detect and report observable signs that an older adult patient is at risk for abuse in her home from her granddaughter • Previously alert patient was exhibiting periods of confusion; found beating roommate with a hairbrush • Mother's labor is failing to progress, nurses unaware of signs of fetal distress; obstetrician not informed; irreversible cerebral damage to fetus • Healthy patient making slower than usual postanesthesia recovery; signs of developing cerebrovascular accident (slurred speech, difficulty moving extremities, falling to one side) present and unnoted
Standard II: Diagnosis The registered nurse analyzes the assessment data to determine actual or potential diagnoses, problems, and issues. • Failure to identify priority nursing diagnosis critical to the patient's care • Nursing diagnosis incorrectly developed and "labels" the patient negatively	• Nowhere in the resident's care plan it was noted that the patient had a history of choking on food ("impaired swallowing") and that close supervision was indicated during meals; patient aspirated Brussels sprout and died • Homosexual male patient without acquired immunodeficiency syndrome (AIDS) admitted for gallbladder surgery questions the few interactions he has with staff; nursing diagnosis on Cardex reads "High Risk for Violence: Directed at Others (AIDS), related to homosexuality"
Standards III and IV: Outcome Identification and Planning The registered nurse identifies expected outcomes for a plan individualized to the health care consumer or the situation and develops a plan that prescribes strategies to attain expected, measurable outcomes. • No indication in nursing care plan that nurses were aware of and sensitive to the patient's health care priorities	• Obese patient with a history of impaired circulation continually refuses to ambulate after major abdominal surgery; patient dies after a massive pulmonary embolism; care plan showed no concern or attempt to compensate for patient's lack of mobility; family states that no nurse consulted them to encourage mobility
Standard V: Implementation The registered nurse implements the identified plan. • Patient's record contains no documentation of attempts to teach appropriate self-care measures to patient and family • Nursing interventions deviate from usual standard of care (understaffing, indifference on part of nurse, inexperience of nurse, faulty or scarce equipment or resources)	• Male patient discharged from short-procedure unit on crutches; falls first day home, refracturing leg; alleges his not receiving instructions for crutch walking caused fall; patient record contains no documentation of patient education • Skin breakdown on frail, older, homebound patient worsens with eventual muscle deterioration; sepsis; nurses seem confused about treatment regimen for pressure injuries; treatment is inconsistent

Standard VI: Evaluation The registered nurse evaluates progress toward attainment of goals and outcomes. • No evidence in care plan and nursing notes that nurses evaluated whether the patient achieved target goals • Patient discharged before key goals are met and without follow-up instruction	• Male patient, newly started on insulin therapy, discharged after giving himself the insulin only once, and without understanding the relationship among food, exercise, and insulin. No referral made to visiting nurse; patient readmitted after 2 weeks with dangerously low blood sugar after overdose with insulin

NURSE AS EXPERT WITNESS

A nurse may be called by either attorney to testify as an **expert witness** to explain to the judge and jury what happened based on the patient's record and to offer an opinion about whether the nursing care met acceptable standards. Nurse expert witnesses need a solid educational background and strong clinical experience comparable with those of the nurse defendant. The expert witness also needs an understanding of the legal aspects of nursing and malpractice liability as well as knowledge of the state nurse practice act and the standard of nursing care where the incident occurred.

FIGURE 7-1. Competent practice is the nurse's most important legal safeguard. Careful documentation ensures a record of competent practice.

LEGAL SAFEGUARDS FOR THE NURSE

The U.S. health care system has a variety of safeguards to protect nurses from exposure to legal risks while performing the duties of their role and to ensure that the practice environment is geared toward enhancing patient and personal safety. As you read the following sections, consider the scenario featured in the Nursing Advocacy in Action display and the implications for nursing practice.

Competent Practice

Competent practice remains the nurse's most important and best legal safeguard (Fig. 7-1). Each nurse is responsible for making sure that their educational background and clinical experience are adequate to fulfill the nursing responsibilities delineated in the job description.

Legal safeguards include the following:

- Developing and maintaining interpersonal communication skills
- Respecting legal boundaries of practice
- Knowing and following institutional procedures and policies
- "Owning" personal strengths and weaknesses; seeking means of growth, education, and supervised experience to ensure continued competence for new and evolving responsibilities
- Evaluating proposed assignments; refusing to accept responsibilities for which you are unprepared
- Keeping current in nursing knowledge and skills

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

- Respecting patient rights and developing rapport with patients
- Working within the facility to develop and support management policies
- Keeping careful documentation

Remember that the medical record is the best, and sometimes the only, available evidence if you must defend your actions. Nurse attorney Edie Brous (2014, p. 60) recommends the following:

- Document all clinical observations and critical diagnostics.
- Document conversations with other providers regarding patient issues.
- Document which specific health care provider was notified of which specific concerns at what specific time.
- Document that the chain of command has been engaged when necessary.
- Make sure that the medical record reflects that you pursued your concerns to resolution.

Think back to **Ella Rodriguez**, the girl with a fractured arm requiring the administration of sedation according to the facility's protocol. The nurse should incorporate knowledge of the legal safeguards for competent practice when preparing to administer the medication as well as knowledge of the unit's protocol. In addition, the nurse should identify personal limitations and confront the health care provider, stressing the need for his presence to ensure the patient's safety.

Nursing Advocacy in Action

Patient Scenario

Mr. Spahn is a 49-year-old attorney who suffered a cerebral bleed. After his brain surgery, his surgeon informed the family that Mr. Spahn has massive, irreversible neurologic damage. In short, barring an act of God or nature he will have no meaningful recovery. His wife is already suing the first hospital that treated her husband because they delayed performing the appropriate diagnostic tests. She and her daughter complain frequently about the nursing care Mr. Spahn is receiving now, and no one wants to take care of him because they are afraid of being named in a lawsuit. Mrs. Spahn keeps a notebook in which she writes down the name of every caregiver who helps her husband. She has placed numerous calls to complain to administration about everything from the cleanliness of the room to a torn sheet. You believe that he is receiving less than optimal care because everyone is afraid of his family bringing a lawsuit.

Implications for Nursing Advocacy

How will you act if you are Mr. Spahn's nurse? Talk with your classmates and experienced nurses about the questions that follow.

- If you elect to advocate for Mr. Spahn, what practical steps can you take to ensure better health outcomes?
- What is it reasonable to expect of a student nurse, a graduate nurse, and an experienced nurse in this situation?
- What advocacy skills are needed to effectively respond to this challenge?

Box 7-3 **Nursing Malpractice Prevention**

Most Frequent Allegations Against Nurses and Related Prevention Tips

1. **Failure to ensure patient safety**
   - Monitor patients in a timely manner consistent with facility policy and the changing needs of the patient. Assess and document potential for injury. Incorporate safety needs into the care plan.
   - Clearly define criteria for use of restrictive devices. Ensure that the use of restrictive devices is

consistent with facility policy. Use the least restrictive devices that will be effective in preventing injury.
- Update your knowledge involving patient safety and new interventions to prevent and reduce injury.
- Evaluate whether patients at high risk for injury are routinely identified before injury results.

2. **Improper treatment or performance of treatment**
   - Question treatments that you believe are improper. Know your facility's policy for questioning a problematic order.
   - Use proper techniques when performing procedures, and follow facility procedures.
   - Seek assistance when unsure of a new procedure. Never perform an intervention until you know what you are doing, why you are doing it, and your ongoing assessment and teaching responsibilities.
   - Update your clinical skills through continuing education classes, conferences, and workshops.
3. **Failure to monitor and report**
   - Follow health care provider orders regarding monitoring of patients unless changes in the patient's condition necessitate a change in the frequency of monitoring; report the need for change to the health care provider.
   - Report any requested information or significant changes in a patient's condition. If unsure of the significance of an observed change, consult with an experienced colleague.
   - Perform appropriate and timely nursing assessments.
   - Ensure that the nurse–patient ratio is adequate.
4. **Medication errors and reactions**
   - Verify any questionable medical orders.
   - Verify patient's name and date of birth before administering medication and use appropriate facility-specific identifiers such as bar coding.
   - Listen to any patient questions or objections regarding a medication, and investigate the patient's concerns before administering the medication.
   - Refer to a drug reference for any questions about appropriate dosages, side effects, and reactions.
   - Know your facility's policies on verbal and written medication orders and on medication administration.
   - Update your knowledge of medications and new medication administration protocols.
5. **Failure to follow facility procedure**
   - Know your facility's procedures. Ensure that your orientation to new responsibilities familiarizes you with pertinent policies and procedures.
   - If you must deviate from a procedure, discuss the incident with your supervisor and decide on appropriate action.
   - Advise the appropriate person of procedures that need to be revised.
6. **Documentation**
   - Document significant information about your patients objectively and factually.
   - Know and follow the facility's documentation policies.
   - Document specific times that you performed actions, made observations, or performed patient assessments.
   - Document legibly when writing, spell correctly, and use only facility-approved abbreviations.
   - Be sensitive to privacy considerations when documenting on a computer.
   - Routinely evaluate the quality of documentation and update your knowledge of new documentation methodologies.
7. **Equipment use**
   - Learn how to operate equipment in a safe and appropriate manner. Never operate equipment with which you are unfamiliar.
   - Use predetermined procedures when teaching patients how to use equipment, and ensure that all nurses involved in patient education are teaching the same procedures.
   - Provide home care patients with the telephone number of a 24-hour backup hospital or home care service available in case of emergency.
   - Have patients demonstrate their competence with equipment before allowing them to use it.
   - Attend orientations and in-services on the use of new or modified equipment.
8. **Adverse incidents**
   - If an adverse incident occurs, complete the appropriate documentation and report the incident to the designated person following facility policy.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

- Do not assume, voice, or record any blame for the incident.
- Know the institutional chain of command for reporting instances when patient care is at issue.
- Support facility loss prevention programs that identify potential liabilities, guard against patient injuries, and maximize the defense of the facility and its employee nurses.

9. **Patients with human immunodeficiency virus (HIV)**

- Be conscious of actions that could result in a lawsuit:
- Discrimination in treatment
- Nosocomial (in-hospital) transmission of virus
- Breach of confidentiality
- Participation in testing a patient for HIV without first obtaining informed consent
- Know and follow facility policies and procedures for the care of patients with infectious diseases.
- Update your knowledge of HIV infection; be familiar with national standards (such as those established by the Centers for Disease Control and Prevention) and pertinent state/province laws.

Competent practice includes developing sensitivity to common sources of patient injury, such as falls, restraints, and malfunctioning equipment, and then taking specific measures to prevent patient injury. Box 7-3 lists the most frequent allegations against nurses and related prevention tips.

Issues That Affect Competent Practice

Staying competent for our practice in today's rapidly changing health care world will always be a challenge. New technologies, medications, protocols, and policies will always challenge our ability to learn and adapt. What also challenges competence is nurse fatigue (no surprise) and the potential for developing substance use disorders. Sherman (2017) makes it a point to ask nurses in each of her presentations on building resilience to "stand up" if they practice particular resilience-building strategies. In each session, sleeping 7 hours was the *least* practiced resiliency strategy. "It is not uncommon for nurses not to take breaks, to eat on the run and to rarely use the restroom—almost a badge of honor in some settings. And now, our lack of self-care is starting to catch up with us as the work environment becomes more stressful."

Nurse Fatigue

We now know that fatigued and sleep-deprived nurses place their patients and themselves at serious risk for harm. The ANA issued a position statement addressing nurse fatigue in 2014. They urged registered nurses (RNs) and employers in all care settings to collaborate to reduce the risks of nurse fatigue and sleepiness associated with shift work and long work hours. Fatigued nurses are more likely to express concern that they made a wrong decision about a patient's care (Scott et al., 2014). During the COVID-19 pandemic the amazing salaries and benefits some employers were offering to attract nurses, especially those skilled in critical care, made it very tempting for nurses to assume more shifts than any nurse should reasonably carry. It is a good practice as students to make it a habit to be rested before appearing for clinical responsibilities and to continue this practice throughout your career.

The Impaired Nurse

About 1 in 10, or 10% to 15% of all nurses, may be impaired or in recovery from alcohol or drug use disorder. The stresses involved in nursing and health care, combined with the availability of controlled substances, make nurses prime candidates for alcohol and drug use disorders. Startlingly, more than half of all impaired nurses began using substances during their nursing education days.

In the past, nurses with substance use disorders usually were promptly punished by firing and license suspension. Today, substance use is recognized as a treatable disorder; the objective is to detect problems early and get nurses into treatment. The ANA strongly supports "alternative to discipline" or "peer assistance" programs.

Students should recognize their level of risk and know to seek help promptly if they suspect a personal problem or a problem on the part of a classmate or colleague. Students can talk with a trusted faculty member. Practicing nurses should consult management. O'Neill (2015, p. 9) suggests that nurses who suspect that a colleague may have a substance use disorder ask themselves the following questions:

- What do I observe?
- How does this affect patient care or teamwork?
- What should I do when I have a concern?
- Would my colleague benefit from assistance?

Box 7-4 Indications That a Nurse May Have a Substance Use Disorder (SUD)

As nurses, we care for our patients, but we don't always care for our coworkers or ourselves. As you read

the list below, you may discover that you are working with or have worked with a nurse who displays signs, symptoms, and behavioral changes that may indicate substance use.

Behavioral Changes

- Changes or shifts in job performance
- Absences from the unit for extended periods
- Frequent trips to the bathroom
- Arriving late or leaving early
- Making an excessive number of mistakes, including medication errors

Behavioral changes may have physical manifestations:

- Subtle changes in appearance that may escalate over time
- Increasing isolation from colleagues
- Inappropriate verbal or emotional responses
- Diminished alertness, confusion, or memory lapses

Narcotics Discrepancies

- Incorrect narcotic counts
- Large amounts of narcotic wastage
- Numerous corrections of medication records
- Frequent reports of ineffective pain relief from patients
- Offers to medicate coworkers' patients for pain
- Altered verbal or phone medication orders
- Variations in controlled substance discrepancies among shifts or days of the week

Source: Adapted from National Council of State Boards of Nursing (NCSBN). (2018). *A nurse manager's guide to substance use disorder in nursing*. Author. https://www.ncsbn.org/Mgr_SUDiN_Brochure_2014.pdf

Box 7-4 describes signs and symptoms to watch for. The public's trust and well-being and the well-being of the nurse are both at stake. See the NCSBN video on substance use disorder in nursing: https://www.ncsbn.org/333.htm.

Informed Consent or Refusal

Every person is granted freedom from bodily contact by another person unless consent is granted. In most states, you must be 18 to legally provide medical consent. States vary in the types of medical treatment they allow minors to authorize without their parents' consent; be sure to check your state law.

In all health care facilities, informed and voluntary consent is needed for admission, for each specialized diagnostic or treatment procedure, and for any experimental treatments or procedures. The consent must be written, designated for the procedure to be performed, and signed by the patient or person legally responsible for the patient. A signed consent is not needed in an emergency if there is an immediate threat to life or health, if experts would agree that it is an emergency, and if the patient is unable to consent and a legally authorized person cannot be reached.

Box 7-5 **Checklist to Ensure Informed Consent**

Disclosure

Patient/surrogate has been informed of the (1) nature of the procedure, (2) risks (nature of the risk, magnitude, probability that the risk will materialize) and benefits, (3) alternatives (including the option of nontreatment), and (4) fact that no outcomes can be guaranteed.

Comprehension

Patient/surrogate can correctly repeat in their own words that for which the patient/surrogate is giving consent.

Competence

The patient understands the information needed to make *this* decision, is able to reason in accord with a relatively consistent set of values and can communicate a preference.

The surrogate (if needed) meets the above criteria, knows the patient's wishes to the extent that this is possible, and is free from undue emotional stress and conflict of interests.

Voluntariness

The patient is voluntarily consenting or refusing. Care has been taken to avoid manipulative and coercive influences.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

While informed consent is a protection against lawsuits, the central values underlying informed consent include promoting the patient's well-being and respecting the patient's self-determination (President's Commission for the Study of Ethical Problems in Medicine and Biomedical and Behavioral Research, 1982). For this reason, you should make sure that patients have all the information they need, and that they understand the information, to validly consent to or refuse what is being proposed. Patients who do not speak English require the services of a translator; be sure to check your facility's policies about translation and be familiar with resources. Using a family member to translate is rarely acceptable. Similarly, patients with low literacy may be unable to read what they are signing and require extra help. Elements of informed consent include *disclosure*, *comprehension*, *competence*, and *voluntariness* (Box 7-5). Feeg et al. (2021) describe the distress students experienced when they observed failures to respect the rights of patients in their clinical practice sites.

Obtaining informed consent is the responsibility of the person who will perform the diagnostic or treatment procedure or the research study. Your role as a nurse is to confirm that a signed consent form is present in the patient's chart and to answer any patient questions about the consent. Unless you are obtaining consent for a nurse-prescribed and nurse-initiated intervention, as a nurse you sign the consent form as a witness to the patient signing the form, not as having obtained the consent yourself (Fig. 7-2). In some instances, you may be responsible for having a patient sign the consent form after a clinician has explained the procedure, its risks and benefits, and alternative treatments to the patient. Increasingly, nurses are performing procedures requiring consent, or are part of interdisciplinary teams that meet with the patient to obtain consent for complex interventions (e.g., bone marrow transplantation).

FIGURE 7-2. Informed consent is a process. A mere signature does not guarantee each of the elements of consent: disclosure, comprehension, competence, and voluntariness.

Documenting the consent process with a printed consent form should not be confused with the actual explanation given to the patient and the informed consent itself. When documenting consent, assess whether patients understand what they are signing and are acting voluntarily, and report any problems to the clinician doing the procedure. Having patients describe in their own words what they understand they are consenting to is the best way to make sure that they understand. Nurses often question the patient's understanding of the proposed procedure and its risks or the patient's ability to consent voluntarily to the procedure. Impediments include the effects of anxiety, pain, medication, depression, language barriers, and temporary or permanent states of disorientation and confusion.

Consequences of not obtaining a valid consent include the possibility of charges of battery against the nurse, the doctor, and the health care facility, which has a duty to protect patients and is responsible for its employees' actions.

Concept Mastery Alert

Although, at times, a nurse may be responsible for having a patient sign the consent form, in **all** instances, the nurse is responsible for answering any questions the patient may have and for making sure that the signed consent form is on the patient's chart. If the nurse determines that the patient is unsure or has questionable understanding, the nurse is responsible for notifying the person who had obtained the consent

about the situation so that person can clarify or reexplain the information.

A patient's refusal to sign a consent form should be documented, and the patient should be informed of the possible consequences of the refusal. The patient should sign a release form indicating their refusal to consent and releasing the nurse, health care provider, and facility from responsibility for outcomes of this act. This statement should be witnessed.

Unfolding Patient Stories: Jared Griffin • Part 1

Jared Griffin, a 63-year-old male, is being admitted to the hospital for knee surgery. What is the purpose of informed consent, what circumstances require it, and who is responsible for obtaining informed consent? What is the nurse's role with informed consent for Jared's surgery? (Jared Griffin's story continues in Chapter 46.)

Care for Jared and other patients in a realistic virtual environment: *vSim for Nursing* (thepoint.lww.com/vSimFunds). Practice documenting these patients' care in DocuCare (thepoint.lww.com/DocuCareEHR).

Contracts

A contract is an exchange of promises between two parties. The agreement may be in writing or oral, although oral contracts may be more difficult to prove. The law of contracts provides a remedy for a breach of contract so that the person who suffers from a broken contract may be compensated for any resulting loss. For a contract to be legally enforceable, it must involve real consent of the parties, a valid consideration, a lawful purpose, competent parties, and the format required by law.

Practicing nurses enter into legally valid and binding contracts with both their employers and their patients. Thus, it is important to understand and be able to fulfill the terms of a nursing agreement before agreeing to a contract. Your employment contract should specify what it is reasonable for you to expect of your employer and what the employer can expect of you. An employer that repeatedly expects you to assume supervisory responsibilities without benefit or who fires you without just cause is likely to be guilty of contract violations. Similarly, you may be guilty of contract violations if you refuse to accept reasonable assignments, repeatedly fail to arrive on time for work, or are habitually unable to complete reasonable work assignments. Any action by your employer that violates a federal or state law is the basis of a grievance, even if the employment contract permits the action. Examples include a female nurse receiving less pay for performing the same work as a male nurse, or a supervisor's failure to promote an employee based on race. When discrimination is suspected, complaints should be filed with the Equal Employment Opportunity Commission (EEOC).

Contracts with patients are often implied. There may not be a written contract specifying what is reasonable for patients to expect of nurses, but courts will uphold an implied contract obligating the nurse to be competent and to provide responsible care.

Remember **Meredith Bedford**, the mother of the terminally ill child, who is threatening to sue the hospice. The nurse needs to understand the implied contract between the patient (and his family) and the health care team.

Collective Bargaining

The 2015 ANA Code of Ethics for Nurses states that the nurse, "through individual and collective effort, establishes, maintains and improves the ethical environment of the work setting and conditions of employment that are conducive to

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

safe, quality health care."

Although individual contracts serve many nurses adequately, many nurses have joined other groups of workers whose interests are better protected when contracts are negotiated for them as a group. Collective bargaining is a legal process in which representatives of organized employees negotiate with employers about such matters as wages, hours, and conditions. Arbitration, strikes, and threats of strikes may be used to enhance the terms of employment and to enforce contracts.

Many nurses choose their state nurses' association, rather than a trade organization, as their collective bargaining representative. Other nurses question whether collective bargaining is an appropriate role for a professional organization. When deciding whether to participate in collective bargaining, ask yourself the following questions:

- Will collective bargaining help my professional and economic status?
- Can I address my professional concerns through collective bargaining?
- Can I devote the time and effort that such organized activity demands?
- Can I change my working conditions as a person, or do I need to organize with other nurses to bring about the desired change?

Patient Education

U.S. courts affirm the patient's right to know what is necessary to manage their health, and view patient education as a legal duty of the nurse. Standards for patient education are derived from national professional standards and from state nurse practice acts as well as the local standards described in facility policies, procedure manuals, and job descriptions. Special forms for documenting the nurse's assessment of the patient's learning needs and for subsequent teaching are available in some facilities. Failure to conduct or document an assessment of a patient's learning needs and teaching may later be construed as negligence.

Determine in your practice setting what specific aspects of patient education are the responsibility of nursing. Consult your job description, and be familiar with facility policies regarding patient education and its documentation. Remember that an important aim of nursing is to assist patients in managing their own care. Discuss the nursing care plan with patients and family members, and identify their learning needs and learning readiness. Document the teaching plan as part of the nursing care plan. Document all nursing efforts to educate the patient and family about health care management, and also document the patient's response. If a patient refuses health education or refers you to a family member (e.g., "Talk to my wife about my pills; she'll be giving them to me at home"), document this in the patient's record. If patient education greatly increases the patient's anxiety and the patient requests not to be given any more information, document the patient's initial response to teaching, the patient's request that it be stopped, and, if you complied, your reason for doing so.

Because a lack of time is frequently offered as the reason for failing to document patient education, assess what type of patient documentation is performed routinely in your setting. If possible, develop forms or checklists that will facilitate rapid documentation. For example, preoperative checklists make it easy to record preoperative teaching and are often introduced as evidence in court that preoperative teaching was done. Similarly, other forms have been developed for documenting teaching for patients who have diabetes, teaching after a myocardial infarction, and teaching postpartum and baby care to parents. The teaching role of the nurse is discussed in Chapter 9.

Executing Provider Orders

Nurses are legally responsible for carrying out the orders of a legitimate provider in charge of a patient unless a reasonable person would anticipate the order would lead to injury. Follow these guidelines:

. Be familiar with the parties designated in your state's nurse practice act who can legally write orders for the nurse to execute (e.g., in many states, a physician assistant cannot legally write orders for the nurse).
. Be familiar with your institution's or facility's policy regarding provider orders.
. Attempt to get all provider orders in writing. Verbal orders (VOs) and telephone orders (TOs) should be countersigned within 24 hours. Take the following steps to prevent errors caused by TOs:
   a. Limit TOs to true emergency situations when there is no alternative.
   b. Designate which nurses may take TOs (e.g., those who have more education and experience).
   c. Repeat the TO back to the provider for confirmation.
   d. Document the order, its time and date, the situation necessitating the order, the provider prescribing and reconfirming the order as it is read back, and your name. Indicate if the order is a VO or TO.
   e. When possible, have two nurses listen to a questionable TO, with both nurses countersigning the order. See Chapter 19 for additional guidelines on executing verbal, telephone, and fax orders.
. The Joint Commission (2016b) now permits licensed independent health care providers to send orders via text messaging "as long as a secure text messaging platform is used, and the required components of an order are included." To read more about The Joint Commission's position on sending orders by text message, visit www.jointcommission.org/assets/1/6/Update_Texting_Orders.pdf.
. Question any health care provider order that is:
   a. Ambiguous

b. Contraindicated by normal practice (e.g., an abnormally high dose of medication)
c. Contraindicated by the patient's present condition (e.g., as a patient's present condition improves, the patient may no longer need aggressive forms of treatment)

Remember **Ella Rodriguez**, the young girl requiring a sedation protocol for closed reduction of her fracture. The nurse should understand that the child is at risk for complications if the health care provider is not present during the drug administration. Therefore, the nurse should question the health care provider's order to "start without him" to ensure the patient's safety.

It is a good practice to double-check any order that a patient questions. See Chapter 20 for another discussion of orders.

Delegating Nursing Care

Professional nurses are responsible for delegating nursing activities, but, although RNs may delegate elements of care, they do not delegate the nursing process itself. As a nurse, you remain accountable for any actions you delegate. The ANA/NCSBN joint statement on national guidelines for nursing delegation can be found at https://www.nursingworld.org/_4962ca/globalassets/practiceandpolicy/nursing-excellence/ana-position-statements/nursing-practice/ana-ncsbn-joint-statement-on-delegation.pdf. Chapter 10 addresses nursing's delegation responsibilities.

Documentation

Documentation is discussed in detail in Chapter 20. Although most nurses prefer to spend their time interacting with patients rather than documenting in a patient's record, careful documentation is a crucial legal safeguard for the nurse. Documentation must be factual, accurate, complete, and entered in a timely fashion. The law presumes that if something was not documented, it was not done. This includes even routine acts, such as taking vital signs, repositioning patients, and ensuring the patient's safety. In 2004, The Joint Commission created a list of "Do Not Use" abbreviations that should not be included in documentation. Be sure to check your facility's policies on what and how to document. This is now updated (2019).

Be sure that the nursing care plan is part of the patient's permanent record. Facilities should have flow sheets or a documentation form that enables you to check off routine aspects of care rapidly and completely. You should also write a comprehensive nursing note for each patient problem you address. This note should include the current nature of the problem, how you intervened, the patient's response, and, when appropriate, future priorities for care. After a problem is noted, nursing documentation should demonstrate continuity of care until the problem is resolved.

A common problem reported by nurses is not knowing how to document a situation in which the nurse believes a patient needs medical attention, but the responsible health care providers are not responding to calls for assistance. In this case, the best legal safeguard is to document the facts of the incident, being careful not to make incriminatory statements, such as "Anyone could see we were losing this patient rapidly" or "Once again, Dr. Jones was unavailable when her patient needed her." The note should document the time the health care provider was called, the time of response or lack of response, and the subsequent nursing response (e.g., nursing supervisor notified). Such a note documents that you are carefully assessing the patient, recognizing significant cues, and reporting them appropriately. The nursing supervisor should write the next note after reviewing the case and choosing a course of action. A patient's nonadherence to a treatment also should be documented, along with your attempts to increase adherence.

Appropriate Use of Social Media

Social media platforms have created new opportunities for defamation and violation of a patient's privacy and confidentiality rights. Fortier (2019) offers eight rules of social media etiquette:

- Be aware of your facility's social media policy, review your state nurse practice act, and read "A Nurse's Guide to the Use of Social Media" for tips on best practices.
- Follow organizational policies about checking e-mail and social media profiles while at work. Don't conduct personal business or expect privacy on work computers.
- Don't take photos or videos of patients at work, even if there are not identifiers.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

- Never share patient information in a public forum, including social media.
- Avoid disparaging posts. If you speak badly about patients, families, colleagues, or employers online, it could constitute cyberbullying or professional misconduct.
- Don't post if you're angry or need to vent.
- Anything you post remains accessible even if you delete it later. The time, place, and content of a social media post can be tracked and retrieved.
- Serve as a positive representative of the profession online.

Be familiar with guidelines for use of social media issued by the National Student Nurses' Association, ANA, and the National Council State Boards of Nursing (2018). Inappropriate use of social and electronic media may be reported to a State Board of Nursing. If the board finds the allegations to be true, the nurse may face disciplinary action by the board, including a reprimand or sanction, assessment of a monetary fine, or temporary or permanent loss of licensure. If a nurse's improper use of social media violates state and federal laws established to protect patient privacy, the violations may result in both civil and criminal penalties, including fines and possible jail time. Nurses may also face employment consequences, including termination (https://www.ncsbn.org/Social_Media.pdf).

Adequate Staffing

Understaffing, sometimes called short staffing, is a problem that results in reduced quality of nursing care and may jeopardize patient safety. Temporary management solutions to understaffing, such as floating nurses from one unit to another, or asking (or mandating) nurses to work overtime or double (back-to-back) shifts, are ineffective because they can further jeopardize patient safety. A nurse in an understaffed facility will be held to a professional standard of judgment for accepting responsibility for work and for delegating nursing responsibilities to others. Thus, if a patient claims negligent care, a nurse claiming to have been overworked that evening because of an unrealistic assignment does not have adequate grounds for a legal defense. If patient injury results, the facility and nurse employee will most likely be named as codefendants. Some state nursing associations are using "protest of assignment forms" to track employer practices of routine understaffing.

Whistle-Blowing

Many nurses who are frustrated with unsafe practice environments are speaking up. **Whistle-blowing** is a warning from a present or past member of an organization to the public concerning a serious wrongdoing or danger created or masked by the organization. The decision to whistle-blow can be difficult since some nurses have been threatened with the loss of their jobs and licenses. Whistle-blower laws are intended to prevent employers from taking retaliatory action against nurses, such as suspension, demotion, harassment, or discharge, for reporting improper patient care or business practices. As part of the ANA Nationwide State Legislative Agenda, the ANA and State Nurses Associations are promoting strong whistle-blower laws on the state level that provide legal protections for nurses advocating for patients without fear of reprisal. Many states now have protections in other legislation such as safe staffing and mandatory overtime prohibition. See information about whistle-blower protection at http://www.nursingworld.org to learn more, and see the whistle-blowing section in Chapter 6 on page 138.

Professional Liability Insurance

Although a nurse's best legal safeguard is always competent practice, the increasing number of malpractice claims naming nurses as defendants makes it wise for nurses to carry their own liability insurance. Liability insurance will also support nurses facing licensure disciplinary actions. Nurses may obtain this insurance through the ANA and other nursing associations, as well as from other sources.

Reasons for purchasing a personal professional liability insurance policy include:

- *Protection of the nurse's best interests.* If the nurse is named as a defendant in a malpractice action along with the facility, a conflict of interest could arise between the nurse and the facility. Nurses have no assurance that their best interest will be represented unless they have their own coverage, which provides their own attorney.
- *Limitations of employer's coverage.* Most health care facilities carry "claims-made" insurance, which means that if the nurse is no longer working there or the facility closes, the nurse is not covered when a claim is filed.
- *Care or advice given outside of work.* An employer's policy covers the nurse only within the confines of the work setting.

Nurse attorney White (2011) explores the personal, professional, and historical influences on why nurses should or should not have their own malpractice insurance. As well, White urges nurses to regularly evaluate their circumstances and decide not only whether to carry their own malpractice insurance but what kind and how much. Pohlman (2015) notes that an individual policy provides benefits not usually covered in employer policies, such as coverage for assault, first aid expenses, violations of the HIPAA, libel or slander, depositions, property damage, and license protection benefits. Nurse attorney Brous (2012c, 2016a) is adamant that every nurse should carry liability insurance to defend themselves from licensure disciplining.

Risk-Management Programs

Hoping to reduce malpractice claims, many health care facilities have initiated risk-management programs designed to identify, analyze, and treat risks. Elements of a comprehensive risk management program include the following:

- *Safety program.* The aim is to provide a safe environment in which the basic safety needs of patients, employees, and visitors are met.
- *Product safety program.* The aim is to ensure safe and adequate equipment; this involves ongoing equipment evaluation and maintenance.
- *Quality assurance program.* The aim is to provide quality health care to patients; this involves ongoing evaluation of all systems used in the care of patients.

Nurses with legal questions often find risk managers a helpful resource. Many risk managers encourage nurses and other clinicians to report "near misses" to better identify factors contributing to errors. A "near miss" is an error that would have happened except for someone's alertness and ability to identify and prevent the error.

Just Culture

A "just culture" encourages open reporting of errors, recognizes that errors may be systemic rather than personal failures, and focuses on determining the root of the problem when events such as errors and near misses occur. According to the theory of just culture, three types of behaviors contribute to errors:

- *Human error*, which occurs unintentionally and without malicious intent
- *At-risk behavior*, which encompasses acts designed to cut corners and save time despite the known but seemingly justified behavior
- *Reckless behavior*, which consists of acts that disregard all safety measures

Tocco and Blum (2013, p. 17) describe actions every nurse can take to promote a just culture:

- Report errors, near misses, and other events to your manager and colleagues.
- Encourage colleagues to report their own events.
- Discuss with colleagues what can be done to prevent future events.
- Partner with your manager in communicating your unit's experiences to the nursing practice council or quality council. This promotes learning from these events, which translates to safer care.
- Help colleagues "connect the dots" by linking changes in practice to learning from events.

The NCSBN of Nursing developed a Taxonomy of Error, Root Cause Analysis and Practice-responsibility (TERCAP) tool to track elements of nursing practice breakdown (https://www.ncsbn.org/websites.htm). The most recent TERCAP analysis of 4,000 cases of practice breakdown (2011–2016) revealed:

- Lack of professional responsibility 73% (2,903)
- Lack of clinical reasoning 49% (1,964)
- Lack of intervention 47% (1,867)
- Documentation error 42% (1,662)
- Misinterpretation 37% (1,490)
- Medication error 33% (1,299)
- Lack of attentiveness 25% (1,048)
- Lack of prevention 27% (1,082)

NCSBN has a national web-based network for anonymous reporting of student errors and near misses: Safe Students Reports (SSRs). Nothing like this exists in any other health profession, nor outside the United States. This network allows programs to analyze data related to student errors and near misses and to compare themselves to other programs. See the other web-based resources at NCSBN.

Incident, Variance, or Occurrence Reports

An **incident report**, also called a variance or occurrence report, is used by health care facilities to document the occurrence of anything out of the ordinary that results in, or has the potential to result in, harm to a patient, employee, or visitor (Fig. 7-3). These reports are used for quality improvement and should not be used for disciplinary action against staff members. They are a means of identifying risks. More harm than good results from ignoring mistakes. Incident reports improve the management and treatment of patients by identifying high-risk patterns and initiating in-service programs to prevent future problems. These forms also make all the facts about an incident available to the facility in case of litigation. Increasingly, facilities use paperless computer-based reporting systems that are secure, timely, efficient, and effective. These may also offer online help and formal education and serve as a valuable tool for data analysis.

Medication Occurrence Information Report/PI **ADDRESSOGRAPH**
Send completed form to Risk Management
This document is part of a quality improvement process
CONFIDENTIAL: Do Not PHOTOCOPY
Do Not File in Patient Record
All Sections Must Be Completed

Patient age:_____

Definition of occurrence: *Any preventable event that may cause or lead to inappropriate medication use or patient harm while the medication is in the control of the health care professional, patient, or consumer. Such events may be related to professional practice, health care products, procedures, and systems, including prescribing, order communication, product labeling, packaging, and nomenclature; compounding; dispensing; distribution; administration; education; monitoring; and use.*

Section A: Report filed by (please print): _____ Title: _____ Date/Time: _____
Location of event
Floor/Unit: _____ Date of event: _____ Time of event (24 hour): _____ ☐ Inpatient ☐ Outpatient

Error discovered: ☐ Within same shift ☐ Within 24 hours ☐ Greater than 24 hours

Staff involved in initial error: ☐ Staff RN ☐ Facility RN ☐ Pharmacist ☐ NP ☐ House staff ☐ Attending MD Name: _____
Other staff also involved (i.e., perpetuated the error): ☐ Staff RN ☐ Facility RN ☐ Pharmacist ☐ Health care provider

Staff that discovered error: ☐ Staff RN ☐ Facility RN ☐ Pharmacist ☐ Health care provider

Health care provider notified? ☐ No ☐ Yes Date: _____ Time: _____ Attending: _____

Section B: Medication type:
☐ IV
☐ Non-IV

Medication(s) involved:
A. _____
B. _____

Incident documented in medical record? ☐ Yes ☐ No
Patient/family aware of incident? ☐ Yes ☐ No
(If yes, please comment below)

TYPE OF ERROR *(See reverse for definitions)*	**BREAKDOWN POINT** *(Where in process did the initial error occur?)*	**BREAKDOWN POINT** *(Where in process did the initial error occur?) (continued from the previous column)*
☐ Prescribing ☐ Omission—Total # _____ Schedule: _____ ☐ Monitoring error ☐ Wrong patient ☐ Wrong time ☐ Wrong route ☐ Wrong dose/quantity/extra dose • dose ordered _____ • dose given _____ ☐ Medication D/C'd, given • extra doses: _____ ☐ Wrong drug • med ordered _____ • med given _____ ☐ Medication not ordered • med given _____ • dose _____ ☐ Wrong drug preparation ☐ Wrong rate of administration ☐ Given to patient with known allergy ☐ Investigational protocol not followed ☐ Other _____	☐ Prescribing *circle:* • illegible handwriting • wrong chart/order sheet • incorrect order • incomplete order • other, please describe below ☐ Order processing *circle:* • carbon not pulled/pulled late • order not transcribed • transcribed incorrectly • other, please describe below ☐ Dispensing *circle:* • incorrectly entered into computer by pharmacist/not entered at all • wrong strength sent • wrong med sent • label incorrect/unclear • delay in delivery of medication • other, please describe below *(continued next column)*	☐ Administration *circle:* • med given, but not charted • med charted, but not given • held med given • incorrect medication taken from floor stock/Pyxis and given • incorrect dose/rate calculation • pump error –tubing clamped –incorrect rate setting –pump malfunction –pump turned off ☐ Other, please describe below **ERROR SEVERITY/OUTCOME** ☐ **Category A:** Circumstances or events that have the capacity to cause error ☐ **Category B:** Error occurred; medication not given ☐ **Category C:** Medication given but did not cause patient harm ☐ **Category D:** Resulted in the need for increased patient monitoring but no harm ☐ **Category E:** Resulted in the need for treatment or intervention and caused temporary patient harm ☐ **Category F:** Resulted in initial or prolonged hospitalization and caused temporary patient harm ☐ **Category G:** Resulted in permanent patient harm ☐ **Category H:** Resulted in a near-death event (e.g., anaphylaxis, cardiac arrest) ☐ **Category I:** Resulted in patient death

COMMENTS/DESCRIBE EVENT (include any intervention/treatment given and outcome):

Section C: ANALYSIS/RECOMMENDATIONS/ACTION PLAN *(Manager to complete):*
Possible causes: ☐ abbreviation ☐ calculation error ☐ communication confusing/intimidating/lacking ☐ computer order entry ☐ decimal point/leading zero missing/trailing zero ☐ equipment design ☐ facsimile order ☐ handwriting illegible ☐ inexperienced staff ☐ staffing level ☐ labeling (GUMC) confusing/incomplete/inaccurate ☐ labeling (manufacturer) confusing/incomplete/inaccurate ☐ similar name ☐ patient identification ☐ shift change ☐ floating staff ☐ poor lighting ☐ performance deficit ☐ preparation error ☐ procedure/protocol not followed ☐ reference manual confusing/inaccurate/unclear/outdated ☐ verbal order confusing/incomplete/misunderstood ☐ written order confusing/incomplete/misunderstood ☐ other _____

Signature of Manager: _____ Date: _____

FIGURE 7-3. Sample medication occurrence information report.

The nurse responsible for a potential or actual harmful incident or who witnesses an injury is the one who completes

the incident form. This form should contain the complete name of the person or people involved and the names of all witnesses; a complete factual account of the incident; the date, time, and place of the incident; pertinent characteristics of the person or people involved (e.g., alert, ambulatory, asleep) and of any equipment or resources being used; and any other variables believed to be important to the incident.

Think back to **Ramone Scott**, the patient who received the wrong medication. The nurse should document the incident, including the actions taken upon finding the error such as immediately stopping the medication, assessing the patient, and notifying the health care provider. In addition, the nurse should document continued follow-up assessments and interventions taken to ensure the patient's safety.

A health care provider completes one section of the incident form with documentation of the medical examination of the patient, employee, or visitor with an actual or potential injury.

In some states, incident reports may be used in court as evidence. When documenting a patient incident, be sure to include a complete account of what happened in the patient's record as well as in the incident report. *Documentation in the patient record, however, should not include the fact that an incident report was filed.*

Sentinel Events

The Joint Commission's Sentinel Event Policy defines a **sentinel event** as an unexpected occurrence involving death or serious physical or psychological injury, or the risk thereof. Serious injury specifically includes loss of limb or function. The phrase "or the risk thereof" includes any process variation for which a recurrence would carry a significant chance of a serious adverse outcome. Such events are called "sentinel" because they signal the need for immediate investigation and response. Some examples of sentinel events are wrong-side surgery, suicide, and operative and postoperative complications.

QSEN SAFETY

Safety is one of the core Quality and Safety Nursing Competencies. Every nurse is expected to be alert to anything in a clinical culture that can compromise patient safety and well-being. Be sure to speak up if you see something and be willing to participate in an analysis of the causes contributing to a sentinel event.

Accredited organizations are expected to identify and respond appropriately to all sentinel events occurring in the organization or associated with services that the organization provides or provides for. Appropriate response includes a thorough and credible root cause analysis, implementation of improvements to reduce risk, and monitoring of the effectiveness of those improvements. **Root cause analysis** involves digging progressively deeper into the event, repeatedly asking why the event occurred, and exploring the circumstances that led to it to determine where improvements can be made. Nurses play a critical role in responding to sentinel events.

Never Events

In 2011, the National Quality Forum released a newly revised list of 29 events that they termed "serious reportable events": extremely rare medical errors that should never happen to a patient. Often termed "never events," these include errors such as surgery performed on the wrong body part or on the wrong patient, leaving a foreign object inside a patient after surgery, or discharging an infant to the wrong person. By reporting and following suggested guidelines when a never event occurs, the likelihood of such an error happening again is greatly decreased.

There is growing consensus that hospitals should not be reimbursed for the treatment of the consequences of never events. The Leapfrog Group, a voluntary program aimed at recognizing and rewarding big leaps in health care safety, quality, and customer value, gives public recognition to hospitals if they agree to the following when a never event occurs within their facility:

- Apologize to the patient and family
- Waive all costs related to the event and follow-up care
- Report the event to an external facility
- Conduct a root cause analysis of how and why the event occurred

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

See The Leapfrog Group website, https://ratings.leapfroggroup.org/measure/hospital/responding-never-events.

Patients' Rights

The American Hospital Association developed "A Patient's Bill of Rights" in 1972 (revised in 1992 and 2003). Renamed "The Patient Care Partnership" (Box 7-6), it addresses the expectations, rights, and responsibilities of the patient while receiving care in the hospital, and ranges from "high-quality hospital care" to "helping prepare you and your family for when you leave the hospital." With care moving increasingly from the hospital to the community, legally prudent nurses must be familiar with how different institutions and professional groups define patient rights and responsibilities.

Other bills of rights include the Pregnant Patient's Bill of Rights, the Indian Patient's Bill of Rights, a Nursing Home Bill of Rights, and the Veterans Administration Code of Patient Concern. Each emphasizes a specific aspect of patient rights within a particular health facility and implies a code of ethics that the nurse observes professionally.

Box 7-6 The Patient Care Partnership: Understanding Expectations, Rights, and Responsibilities

When you need hospital care, your doctor and the nurses and other professionals at our hospital are committed to working with you and your family to meet your health care needs. Our dedicated doctors and staff serve the community in all its ethnic, religious, and economic diversity. Our goal is for you and your family to have the same care and attention we would want for our families and ourselves.

The sections below explain some of the basics about how you can expect to be treated during your hospital stay. They also cover what we will need from you to care for you better. If you have questions at any time, please ask them. Unasked or unanswered questions can add to the stress of being in the hospital. Your comfort and confidence in your care are very important to us.

What to Expect During Your Hospital Stay

- **High-quality hospital care.** Our first priority is to provide you the care you need, when you need it, with skill, compassion, and respect. Tell your caregivers if you have concerns about your care or if you have pain. You have the right to know the identity of doctors, nurses, and others involved in your care, as well as when they are students, residents, or other trainees.
- **A clean and safe environment.** Our hospital works hard to keep you safe. We use special policies and procedures to avoid mistakes in your care and keep you free from abuse or neglect. If anything unexpected and significant happens during your hospital stay, you will be told what happened and any resulting changes in your care will be discussed with you.
- **Involvement in your care.** You and your doctor often make decisions about your care before you go to the hospital. Other times, especially in emergencies, those decisions are made during your hospital stay. When they take place, making decisions should include:
  - *Discussing your medical condition and information about medically appropriate treatment choices.* To make informed decisions with your doctor, you need to understand several things:
    - The benefits and risks of each treatment
    - Whether it is experimental or part of a research study
    - What you can reasonably expect from your treatment and any long-term effects it might have on your quality of life
    - What you and your family will need to do after you leave the hospital
    - The financial consequences of using uncovered services or out-of-network providers

  Please tell your caregivers if you need more information about treatment choices.
  - *Discussing your treatment plan.* When you enter the hospital, you sign a general consent to treatment. In some cases, such as surgery or experimental treatment, you may be asked to confirm in writing that you understand what is planned and agree to it. This process protects your right to consent to or refuse a treatment. Your doctor will explain the medical consequences of refusing recommended treatment. It also protects your right to decide if you want to participate in a research study.
  - *Getting information from you.* Your caregivers need complete and correct information about your health and coverage so that they can make good decisions about your care. That includes:
    - Past illnesses, surgeries, or hospital stays
    - Past allergic reactions
    - Any medicines or diet supplements (such as vitamins and herbs) that you are taking
    - Any network or admission requirements under your health plan
  - *Understanding your health care goals and values.* You may have health care goals and values or spiritual

beliefs that are important to your well-being. They will be taken into account as much as possible throughout your hospital stay. Make sure your doctor, your family, and your care team know your wishes.

- *Understanding who should make decisions when you cannot.* If you have signed a health care power of attorney stating who should speak for you if you become unable to make health care decisions for yourself, or a "living will" or "advance directive" that states your wishes about end-of-life care, give copies to your doctor, your family, and your care team. If you or your family needs help making difficult decisions, counselors, chaplains, and others are available to help.
- **Protection of your privacy.** We respect the confidentiality of your relationship with your doctor and other caregivers, and the sensitive information about your health and health care that are part of that relationship. State and federal laws and hospital operative policies protect the privacy of your medical information. You will receive a Notice of Privacy Practices that describes the ways that we use, disclose, and safeguard patient information and that explains how you can obtain a copy of information for our records about your care.
- **Help preparing you and your family for when you leave the hospital.** Your doctor works with hospital staff and professionals in your community. You and your family also play an important role. The success of your treatment often depends on your efforts to follow medication, diet, and therapy plans. Your family may need to help care for you at home.

You can expect us to help you identify sources of follow-up care and to let you know if our hospital has a financial interest in any referrals. As long as you agree we can share information about your care with them, we will coordinate our activities with your caregivers outside the hospital. You can also expect to receive information and, where possible, training about the self-care you will need when you go home.

- **Help with your bill and filing insurance claims.** Our staff will file claims for you with health care insurers or other programs, such as Medicare and Medicaid. They will also help your doctor with needed documentation. Hospital bills and insurance coverage are often confusing. If you have questions about your bill, contact our business office. If you need help understanding your insurance coverage or health plan, start with your insurance company or health benefits manager. If you do not have health coverage, we will try to help you and your family find financial help or make other arrangements. We need your help with collecting needed information and other requirements to obtain coverage or assistance.

While you are here, you will receive more detailed notices about some of the rights you have as a hospital patient and how to exercise them. We are always interested in improving. If you have questions, comments, or concerns, please contact _____.

Good Samaritan Laws

Good Samaritan laws are designed to protect health care providers when they give aid to people in emergency situations. For example, a nurse at the scene of an automobile accident may give emergency care without fear of a legal suit if such care appears necessary, unless care is given in a grossly negligent manner.

Every state in the United States and the District of Columbia has Good Samaritan laws, although the laws vary considerably. Nurses are covered in some states but not in others; in some states, only certain acts are covered. While in many states no person has a legal obligation to help another (except in employment situations), and a health care provider, like any other person, may choose to help or to leave the scene of an emergency, other states consider it mandatory for anyone to give help. Refer to the specific laws in your state. Regardless, in many situations, nurses may have an ethical responsibility to assist. In the event that health care providers assist a person in an emergency situation when it is impossible to obtain consent for the care, they are expected to use good judgment to determine that an emergency exists and to give care that a reasonably prudent person with a similar background and in similar circumstances would provide.

Student Liability

As a student nurse, you are responsible for your own acts, including any negligence that may result in patient injury. Moreover, you are held to the same standard of care as an RN. You are also responsible for being familiar with facility policies and procedures.

Legal Alert

Your legal responsibilities include careful preparation for each new clinical experience and a duty to notify your clinical instructor if you feel in any way unprepared to carry out a nursing procedure. *For no reason should you attempt a clinical procedure if you are unsure of the correct steps involved.*

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

A hospital may also be held liable for the negligence of a student nurse enrolled in a hospital-controlled program because the student is considered an employee. The status of students enrolled in college and university programs is less clear, as is the liability of the educational institution in which they are enrolled and the health care facility offering a site for clinical practice.

Nursing instructors may share responsibility for damages in the event of patient injury if an assignment called for clinical skills beyond a student's competency or the instructor failed to provide reasonable and prudent clinical supervision. Because the status of patients can change rapidly, especially in an acute care setting, notify your instructor or a staff member of any significant changes in the patient's condition, even if you are unsure of the meaning of these changes.

Most nursing programs require students to carry personal professional liability insurance. *School policies provide coverage only for clinical nursing done for educational purposes at the direction of the school.* Moreover, student nurses who work as nursing assistants or in some other health care role are legally permitted to offer only those services included in their job description. Even if you feel confident about medication administration, catheter insertion, or another professional nursing act, you risk disciplinary action if you perform such a procedure outside the supervised clinical practice setting.

LAWS AFFECTING NURSING PRACTICE

Just as many safeguards help protect nurses from the risk of legal action, many laws govern the practice of nursing to protect both nurses and patients from harm.

Occupational Safety and Health

The Occupational Safety and Health Act of 1970 set legal standards in the United States to ensure safe and healthful working conditions. The act, intended to reduce work-related injuries and illnesses, has affected health care facilities and increased certain responsibilities for many nurses. In 1991, the Occupational Safety and Health Administration (OSHA) established safety standards for workers who may be exposed to bloodborne pathogens in their employment. Following are examples of situations that could violate standards if care is not taken, because of the potential threat to worker safety:

- Use of electrical equipment
- Use of isolation techniques for patients with infectious diseases and the management of contaminated equipment and supplies
- Use of radiation, such as infrared or ultraviolet radiation, sound or radio waves, and laser beams
- Use of chemicals, such as those that are toxic or flammable

OSHA's regulations, frequently updated, have specific applications, and fines can be severe for infractions. Nurses can help implement this law by promoting health and safety precautions wherever they work. Nurses employed in industrial settings have a particularly important role. A new Office of Occupational Health Nursing was created at OSHA to underscore the major role that such nurses play in striving for safe and healthful workplaces.

In 2020, unions representing hundreds of thousands of nurses and health care workers filed a lawsuit against OSHA, alleging that the agency is violating its duties to keep workers safe by failing to issue an infectious-disease standard to protect them during the pandemic.

National Practitioner Data Bank

The Health Care Quality Improvement Act of 1986 encourages identification and discipline of health care providers who engage in unprofessional conduct and restricts their ability to move from state to state without a disclosure of their previous performance. When a state licenses, certifies, or registers practitioners, they become subject to the National Practitioner Data Bank requirements. The Act provides immunity from civil damages for peer review and establishes the National Practitioner Data Bank as an information clearinghouse. Nurses may be reported to the National Practitioner Data Bank for medical malpractice payments, adverse licensure actions, or adverse professional actions. In a 2020 webinar, nurse attorney Edie Brous stated that an analysis of National Practitioner Data Bank allegations against nurses revealed that only 2% were for negligence/malpractice. The other 98% were for adverse licensure actions.

Reporting Obligations

Because of the unique nature of nurse–patient interactions, the nurse frequently has knowledge that a state requires to be reported, such as of child abuse, rape, or a communicable disease. Legislation varies; thus, nurses must know what needs to be reported in their local area and to what authority.

Nurses are frequently the first members of the public to detect abuse. Abuse includes a physical, verbal, sexual, or emotional attack; neglect; and abandonment. Targets of abuse include infants, children, and adults of all ages. Abusers are people of all genders, ages, races, socioeconomic groups, and religious backgrounds. Nurses are obligated both ethically and legally to report abuse. In many states, the failure to report actual or suspected abuse is itself a crime. Nurses are protected by law against suits from alleged abusers if they file a report of suspected abuse in good faith that

turns out to be erroneous.

Controlled Substances

The United States has special laws governing the distribution and use of controlled substances (drugs with misuse potential) such as narcotics, depressants, stimulants, and hallucinogens. Drug use and misuse laws are specific, and violations are considered criminal acts. Nursing responsibilities for controlled substances include storing them in special locked compartments and adhering to specific documentation responsibilities.

Discrimination and Sexual Harassment

Title VII of the Civil Rights Act of 1964 protects employees from discrimination based on race, color, religion, sex, or national origin, and provides that pregnant women receive the same protection as other employees and applicants. The EEOC, which enforces Title VII, defines sexual harassment as "unwelcome sexual advances, requests for sexual favors, and other verbal or physical conduct of a sexual nature" occurring in the following circumstances (EEOC, 1980, sections 3950.10 to 3950.11):

- Submission to sexual advances is implicitly or explicitly considered a condition of employment.
- Submission to sexual advances is used as a basis for employment decisions.
- Sexual harassment interferes with job performance even if it only creates an intimidating, offensive, or hostile atmosphere.

See Chapter 46 for a more detailed discussion of sexual harassment and hostile environment.

Health Insurance Portability and Accountability Act

See the discussion of "Invasion of Privacy" on page 150.

Restraints

The Nursing Home Reform Act of 1987 states that long-term care facility residents have the right to be free from physical or chemical restraints imposed for purposes of discipline or convenience and that are not required to treat medical symptoms. When caring for a patient who requires restraints, be sure that you are familiar with your institution's policies and the guidelines set forth by The Joint Commission. Safe use of restraints is discussed in Chapter 28. Also see the discussion of restraints earlier in this chapter under the heading "False Imprisonment." Articles by Lawson et al. (2020) and by Kisacik et al. (2020) explore nurses' knowledge, attitudes, and practices about using restraints in critical care.

People With Disabilities

At least 43 million Americans have physical or mental disabilities. Discrimination against such people persists in such crucial areas as employment, housing, public accommodations, education, transportation, communication, and health services. The 1990 Americans With Disabilities Act (ADA), amended in 2008, provides a broad definition of "disability" to cover any person who has a physical or mental impairment that substantially limits one or more major life activities or who has a record of such impairment. In addition to impairments that have traditionally been perceived as disabilities, the ADA also specifically protects people who have communicable diseases such as AIDS or HIV infection; people who are recovering from drug or alcohol use disorders; and people who are regarded as being disabled, whether they are disabled or not. The ADA imposes two requirements on businesses covered by the Act: It prohibits such entities from discriminating against people with disabilities and requires covered entities to "reasonably accommodate" people who are protected by the Act.

Wills

State and provincial laws regulate requirements for wills. The person who makes a will is called the testator. A will describes the intentions of a testator (for who will manage the estate and how property is to be disposed) to be carried out upon their death. A person who receives money or property from a will is called a beneficiary.

Depending on state law, nurses may be asked occasionally to witness a testator's signing of their will and should be familiar with the following guidelines:

- The witness should feel sure that the testator is of sound mind—that is, that the testator knows what they are doing and is free of the influence of drugs that could distort thinking.
- The witness should feel sure that the testator is acting voluntarily and is not being coerced in any way concerning the terms of their will.
- Witnesses should watch the testator sign the will, and they should sign in the presence of each other. State law indicates how many witnesses must acknowledge the testator's signature on a will; two or three witnesses are most commonly required.
- Witnesses to the signature on a will do not need to read it, but they should be sure that the document being signed is a will and not some other type of document.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

- In most states, a person who is a beneficiary in a will is disqualified from being a witness to the testator's signature.

Legal Issues Related to Dying and Death

Legal responsibilities for the dying or deceased patient are discussed in Chapter 44. Legal issues include advance directives, Patient Self-Determination Act (PSDA), do-not-resuscitate/allow natural death orders, assisted suicide/medically assisted dying, direct voluntary euthanasia, determination of death, organ donation, autopsy, and inquest.

DEVELOPING CLINICAL REASONING AND CLINICAL JUDGMENT

. Nursing's collaborative responsibilities include helping other health care providers obtain informed and voluntary consent for treatment in difficult situations. How might a nurse facilitate the process of obtaining informed consent in the following situations?

- A 15-year-old boy with cancer who is tired of therapy needs a new course of chemotherapy.
- Parents who speak little English are being asked to consent to surgery for their newborn.
- An older adult who has had pain with eating for 6 months is being offered an exploratory laparotomy. She tells the surgeon, "I don't care what you do, just get rid of this pain."
- Rehabilitation options are being considered for an older adult who is intermittently confused.

. You are caring for a recently hospitalized patient who had been living in a retirement community. When his daughters, who tend to be critical, come to visit, they tell you that they hope their father's care here will be better than it was in the retirement community, which they are in the process of suing. How would you respond to the daughters, and what, if anything, would you share with other nurses about this incident?

. The erratic behavior of a teenage patient on your unit is causing nurses to suspect that he is getting illegal drugs from his friends who visit. You are asked to keep a watchful eye. When changing his bed linens later in the day, you discover a cache of drugs. What are your next steps?

. Recent layoffs have reduced the number of professional nurses on your unit, and you are increasingly concerned about patient safety as well as quality-of-care issues. What would you do about your concern for your personal liability for inadequate care?

. A patient posts a video about you on social media that you had no idea was being filmed. By the time you see it, more than 500 people have viewed it. How do you respond? A colleague posts an image of sacral pressure injury with the words, "we don't get paid enough to do this work." When you question her, she tells you there is no way to identify the patient involved. How do you respond?

. When you bring an antipsychotic medication to your alert long-term care facility resident, she refuses to take it, saying, "I don't like the way it makes me feel." When you report this to one of the nurses, she tells you that they always crush the medication and administer it in food so that the resident doesn't know what she is getting. How do you respond?

PRACTICING FOR NCLEX

. A nursing professor pulls a student aside to discuss documenting a patient's blood pressure of 202/122 but not reporting this to the primary nurse. When discovered, the patient was transferred to the intensive care unit for treatment and monitoring. How does the faculty best explain to the student that their inaction reflects negligence?

a. "You did not re-assess your patient."
b. "There was poor interprofessional communication with the health care team."
c. You failed to act as a reasonably prudent nurse would under similar circumstances."
d. "This action is consistent with a felony criminal action."

. Nursing students approaching graduation and licensure are required to read the state nurse practice act. Which topics in the law will they identity as guides to professional practice? Select all that apply.

a. Actions resulting in discipline
b. Clinical procedures
c. Medication administration
d. Scope of practice
e. Delegation policies
f. Medicare reimbursement

. A nurse on a surgical unit is concerned about a colleague's possible substance use disorder. Which signs and symptoms could support the nurse's suspicion? Select all that apply.

a. Exhibiting diminished alertness and somnolence while working
b. Attending multiple continuing education conferences
c. Offering to medicate coworkers' patients for pain

d. Making incorrect narcotics counts and creating wastage
e. Leaving the unit frequently

. A new graduate nurse tells the preceptor they want to obtain recognition in wound care, a specialty area of nursing. What credential will this nurse need to seek?
a. Accreditation
b. Licensure
c. Certification
d. Board approval

. The nurse reports to their manager that informed consent was not obtained from a patient for whom HIV testing was already performed. The nurse suggests which intentional tort may have been committed?
a. Assault
b. Battery
c. Invasion of privacy
d. False imprisonment

. A patient died during routine outpatient surgery, and the nurse was accused of having failed to monitor and interpret vital signs. Which fact must be established to prove them guilty of malpractice or negligence?
a. The surgeon testifies the nurse's action was pure negligence, saying that the patient could have been saved.
b. This patient should not have died since they were healthy, physically active, and involved in the community.
c. The nurse intended to harm the patient and was willfully negligent, as evidenced by the tragic outcome.
d. The nurse had a duty to monitor the patient, and due to the nurse's failure to perform this duty, the patient died.

. An attorney representing a patient's family who is suing for wrongful death calls the nurse to obtain a better understanding of the nurse's actions. How will the nurse respond?
a. "I can't talk with you; you will have to contact my attorney."
b. "I will answer your questions, so you'll understand how the situation occurred.
c. "I hope I won't be blamed for the death because it was so busy that day."
d. "First tell me why you are doing this to me. This could ruin my career!"

. A nurse follows a prescription written by the health care provider to administer a medication to which the patient is allergic. How does the nurse interpret their liability for administering this medication?
a. The nurse is not responsible because they were following the provider's orders.
b. The nurse is responsible because they administered the medication.
c. The health care provider is responsible because they ordered the drug.
d. The nurse, health care provider, and pharmacist bear responsibility for their actions.

. A nurse answers a call light and finds the patient on the floor. After the health care provider examines the patient and finds no injury, the nurse returns the patient to bed and fills out an incident report. What statements are true about incident reports? Select all that apply.
a. They can be used as disciplinary action against staff members.
b. They can be used as a means of identifying risks.
c. They can be used for quality control.
d. They must be completed by the facility manager.
e. They make facts available in litigation cases.
f. They should be documented in the patient record.

. A nursing student is preparing to administer medications and asks the clinical instructor about legal liability in clinical practice. What is the most appropriate response?
a. "Students are not responsible for their acts of negligence resulting in patient injury."
b. "Student nurses are held to the same standard of care that would be used to evaluate the actions of a registered nurse."
c. "Hospitals are exempt from liability for student negligence if the student nurse is properly supervised by an instructor."
d. "Most nursing programs carry group professional liability making student personal professional liability insurance unnecessary."

. The nurse manager reviews the medical record of a patient who has accused a nurse of negligence after requiring a "needless" admission to the intensive care unit postoperatively. Which entry in the electronic health record requires follow-up by the manager?
Exhibit: Electronic health record (EHR)

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Nursing Notes: Postoperative follow-up
12:20 pm: patient still reporting incisional pain of 10/10, provider contacted, increased morphine from 1 mg to 2 mg every hour
2: 15 pm: dime-sized, dark red–brown blood stain on dressing; area circled
2:30 pm: patient reports incisional pain, 7/10, 2 mg morphine administered
2:45 pm: vital signs T 99.2°, P 120, RR 20, BP 84/48; will continue to monitor

a. Inappropriately recorded vital signs
b. Pain treated without appropriate assessment
c. Failure to follow up on tachycardia and hypotension
d. Lack of interpretation of vital signs and follow-up

. A patient admitted through the emergency department for a severe infection is receiving intravenous (IV) antibiotics. The patient, who has been oriented, demands the nurse remove the IV because the patient is leaving now. What action will the nurse take?

a. Apply soft wrist restraints
b. Perform a neurologic assessment
c. Explain that after signing an "against medical order form," the patient may leave
d. Call the patient's family to encourage the patient to stay

ANSWERS WITH RATIONALES

. **c.** Negligence is defined as performing an action that the reasonably prudent nurse would not perform or failing to act as a reasonably prudent nurse would in similar circumstances. Negligence may be an act of omission or commission. Criminal law concerning state and federal criminal statutes includes murder, manslaughter, criminal negligence, theft, and illegal possession of drugs. Public law regulates relationships between people and the government. Private or civil law includes laws relating to contracts, ownership of property, and the practice of nursing, medicine, pharmacy, and dentistry.

. **a, d.** Each state has a nurse practice act that protects the public by broadly defining the legal scope of nursing practice. Practicing beyond those limits makes nurses vulnerable to charges of violating the state nurse practice act. Nurse practice acts also list the violations that can result in disciplinary actions against nurses. Clinical procedures are covered by the health care institutions themselves. Medication administration and delegation are topics covered by the board of nursing. Laws governing Medicare reimbursement are enacted through federal legislation.

. **a, c, d, e.** Signs of substance use in nurses may include diminished alertness or somnolence, leaving the unit frequently, incorrect narcotic counts, wastage, offers to medicate colleagues' patients, or changes in job performance, among others. Attending professional conferences is an example of a nurse who is fully engaged with their work.

. **c.** Certification is the process by which a person who has met certain criteria established by a nongovernmental association is granted recognition in a specified practice area. Nursing is one of the groups operating under state laws that promote the general welfare by determining minimum standards of education through accreditation of schools of nursing. Licensure is a legal document that permits a person to offer to the public skills and knowledge in a particular jurisdiction, where such practice would otherwise be unlawful without a license. State board of approval ensures that nurses have received the proper training to practice nursing.

. **b.** Assault is a threat or an attempt to make bodily contact with another person without that person's consent. Battery is an assault that is carried out. Every person is granted freedom from bodily contact by another person unless consent is granted. The Fourth Amendment gives citizens the right of privacy and the right to be left alone; a nurse who disregards these rights is guilty of invasion of privacy. Unjustified retention or prevention of the movement of another person without proper consent can constitute false imprisonment.

. **d.** Liability involves four elements that must be established to prove that malpractice or negligence has occurred: duty, breach of duty, causation, and damages. Duty refers to an obligation to use due care (what a reasonably prudent nurse would do) and is defined by the standard of care appropriate for the nurse–patient relationship. Breach of duty is the failure to meet the standard of care. Causation, the most difficult element of liability to prove, shows that the failure to meet the standard of care (breach) caused the injury. Damages are the actual harm or injury resulting to the patient.

. **a.** The nurse should not discuss the case with anyone at the facility (except the risk manager), with the plaintiff, with the plaintiff's lawyer, with anyone testifying for the plaintiff, or with reporters. This is one of the cardinal rules for nurse defendants.

. **d.** Nurses are legally responsible for carrying out the orders of the health care provider in charge of a patient unless an order would lead a reasonable person to anticipate injury if it was carried out. If the nurse should have anticipated injury and did not, both the prescribing health care provider and the administering nurse are responsible for the harms to which they contributed.

. **b, c, e.** Incident reports are used for quality improvement and should not be used for disciplinary action against staff members. They are a means of identifying risks and are filled out by the nurse responsible for the injured party. An

incident report makes facts available in case litigation occurs; in some states, incident reports may be used in court as evidence. A health care provider completes the incident form with documentation of the medical examination of the patient, employee, or visitor with an actual or potential injury. Documentation in the patient record should not include the fact that an incident report was filed.

- **b.** Student nurses are held to the same standard of care that would be used to evaluate the actions of a registered nurse. Student nurses are responsible for their own acts of negligence if these result in patient injury. A hospital may also be held liable for the negligence of a student nurse enrolled in a hospital-controlled program because the student is considered an employee of the hospital. Nursing instructors may share responsibility for damages in the event of patient injury if an assignment called for clinical skills beyond a student's competency or the instructor failed to provide reasonable and prudent clinical supervision. Most nursing programs require students to carry personal professional liability insurance.
- **d.** Nurses are responsible for gathering assessment data including vital signs and interpreting them considering the patient's condition and trends. The nurse did not document interventions from the health care provider for typical symptoms of shock, including tachycardia and hypotension.
- **c.** A person cannot be legally forced to remain in a health facility, such as a hospital, if that person is of sound mind. The patient signs an "against medical orders" form when insisting on being discharged, to indicate not holding the facility responsible for harm from leaving. Applying soft wrist restraints when the patient has expressed wanting to leave constitutes battery, which includes willful, angry, and violent or negligent touching of another person's body or clothes or anything attached to or held by that other person. The patient has been oriented, so another assessment is not indicated. The patient, not the family, has autonomy.

Communication

Susie Musashi

Susie is a 3-year-old patient with second-degree burns on both legs. Every time a health care provider enters her room, she begins to cry, turning her body toward the wall and curling up with her knees to her chest. Her family lives approximately 1½ hours away and can visit her only about once or twice a week.

Irwina Russellinski

Irwina, a 75-year-old woman, has been transferred to a long-term care facility from the hospital after being diagnosed and treated for pneumonia. Her health record reveals that she is hard of hearing, “pleasantly confused” at times, and speaks “broken English.” An initial nursing assessment is needed.

Randolph Gordon

Randolph, a middle-aged man diagnosed with end-stage liver failure, is being cared for in the intensive care unit (ICU). He has been comatose for several weeks. He has numerous tubes and drainage devices in place and is receiving multiple therapies that require continuous electronic monitoring.

Learning Outcomes

After completing the chapter, you will be able to accomplish the following:

. Describe the communication process and identify factors that influence communication.
. Describe ways in which people communicate nonverbally.
. Discuss professional responsibilities when using electronic communication and other communication technologies.
. Describe the interrelation between communication and the nursing process.
. Identify patient goals for each phase of the therapeutic nurse–patient relationship.
. Use appropriate communication techniques when interacting with patients from different cultures.
. Use a standardized communication technique (e.g., SBAR) to communicate with other nurses and health care providers.
. Evaluate yourself in terms of the interpersonal competencies needed in nursing.
. Describe how each type of ineffective communication hinders communication.
. Describe strategies that counteract disruptive professional communication and behaviors.
. Establish therapeutic relationships with patients assigned to your care.
. Describe effective interventions for patients with impaired communication.

social media
therapeutic relationship
verbal communication

Anurse who wishes to be an effective caregiver must first learn how to be an effective communicator. Good communication skills enable nurses to get to know their patients and, ultimately, to diagnose and meet their needs for nursing care. Nursing students who sit face to face with patients to obtain a comprehensive nursing history intuitively grasp the importance of the nurse's communicator role. To adequately document the patient's health history, the nursing student must understand and implement proper communication techniques. Communication skills are the building blocks of professional relationships between nurse and patient, nurse and nurse, and nurse and other health care team members. Refer to the accompanying Reflective Practice box on page 174.

Many experienced nurses identify the quality of their interpersonal relationships as the single most significant element in determining their helper effectiveness. On nursing units where nurses freely exchange ideas and information, solve problems together when something goes wrong rather than assigning blame, compliment one another, and use humor creatively, staff morale is high and there is a higher level of attainment of patient outcomes. On the other hand, when harassment or disruptive communication and/or behaviors occur in the workplace between health care professionals, the consequences can affect the emotional and physical well-being of those involved, the functioning of the organization, and the safety of patient care. The American Association of Critical-Care Nurses (AACN) provides standards for establishing and sustaining healthy work environments, and states the quality of the work environment is linked to excellent nursing practice and patient care outcomes (AACN, 2016). These standards include skilled communication: "Nurses must be as proficient in communication skills as they are in clinical skills" (AACN, 2016, p. 2). Effective communication supports collaborative relationships and continuous improvement in patient safety and quality of care (AACN; ANA & AONE, n.d.; Settani et al., 2019).

TEAMWORK AND COLLABORATION

Nurses must communicate with team members in a manner that promotes open communication and mutual respect. Communication and collaboration between the nurse, patient, and other health care professionals results in quality person-centered care.

PROCESS OF COMMUNICATION

Communication is the process of exchanging information and generating and transmitting meanings between two or more people. It is the foundation of society and the most primary aspect of a nurse–patient interaction. Without communication, it would be impossible to share family experiences, gain knowledge, establish and maintain practice protocols, and enhance caregiving. By nature, humans are social beings, and human needs are met in collaboration with other humans. Human relationships enable us to meet our physical and safety needs. Communication also assists in meeting our psychosocial needs of love, belonging, and self-esteem. The ability to communicate is basic to human functioning and well-being.

David K. Berlo (1960) is credited with the classic description of the communication process, which involves a source (encoder), message, channel, and receiver (decoder). This communication process is initiated based on a stimulus, in this case, a patient need that must be addressed. The need might be due to a patient's discomfort or desire for information or to address any uncertainty the patient might be experiencing. The sender or source (encoder) of the message is a person or group who initiates or begins the communication process.

QSEN Reflective Practice: Cultivating QSEN Competencies

CHALLENGE TO ETHICAL AND LEGAL SKILLS

Recently, I was accompanying a nurse in the ICU when I encountered some behaviors that I found to be unprofessional and lacking in interpersonal communication skills. We were caring for Mr. Randolph Gordon, a middle-aged patient who was in end-stage liver failure and had been comatose for several weeks. The extent of drains, tubes, and technologies being used to care for Mr. Gordon was overwhelming. It was almost difficult to recognize him as a human being. I was taken aback when the nurse and some residents entered the patient's room and immediately began to assess the technologic equipment, without any regard for or recognition of the patient. They proceeded to have a conversation about the patient's poor condition, unsightly appearance, and foul smell at the bedside, in the direct presence of the patient. They did not speak to the patient and they made no attempt to interact with the patient, not even the slightest touch of a hand.

Thinking Outside the Box: Possible Courses of Action

- Ignore the conversation between the nurse and residents and acknowledge the patient through words or touch.
- Calmly ask the nurse and residents to leave the room before discussing the patient's condition.
- Confront the nurse and residents, stating that they need to pay attention to the patient and his psychosocial and emotional well-being.

Evaluating a Good Outcome: How Do I Define Success?

- The patient's health care team will act with professionalism.
- The health care team will demonstrate respect for the patient's human dignity.
- The health care team will have regard for the whole patient, with attention to spiritual, emotional, and social issues.
- The health care team will set a good example for others in our expression of caring.

Personal Learning: Here's to the Future!

I was somewhat disappointed by my actions in this situation because I did not confront the nurse and the residents when they were acting unethically and unprofessionally. I did, however, ask the nurse if this was common behavior in the ICU—that is, demonstrating little regard for the patient's holistic well-being. The nurse stated that unfortunately this was the case. The patients in the ICU are critically ill, and many health care professionals become extremely focused on the physical and technologic aspects of care. I was hesitant to interrupt the nurse and the residents because of my status as a nursing student. I feared that my opinion would not be respected. I know that I will not be able to change the actions of everyone. However, in the future, I will demonstrate my concern for the patient, hoping that those around me will follow my example. I think that I should have immediately gone to the patient and said hello or touched his hand, even if he was comatose. Maybe my actions would have reminded the nurse and residents that there was a person in that bed. Then, possibly, they might have followed my lead.

Colleen Kilcullen, Georgetown University

QSEN SELF-REFLECTION ON QUALITY AND SAFETY COMPETENCIES DEVELOPING KNOWLEDGE, SKILLS, AND ATTITUDES FOR CONTINUOUS IMPROVEMENT

How do you think you would respond in a similar situation? Why? What does this tell you about yourself and about the adequacy of your skills for professional practice? What knowledge, skills, and attitudes do you need to develop to continuously improve quality and safety in a situation like the one experienced by this student nurse?

Patient-Centered Care: How could the nursing student's communication skills have demonstrated empathy and emotional support for this patient? Did her handling of this situation facilitate her ability to deliver effective care and treatment in other environments? What reasons can you propose to suggest the rationale for the nurse's and residents' behavior?

Teamwork and Collaboration/Quality Improvement: How do you think the residents would have reacted if the nursing student had approached them about their behavior? Can you think of other ways to respond? Describe a plan that the nursing student could use to go about changing the staff's behavior. What communication skills might effectively communicate empathy and caring by all the professional staff caring for this patient?

Safety/Evidence-Based Practice: Do you agree with the criteria to evaluate a positive outcome in this situation? Did the nursing student meet the criteria? Please explain why or why not. Should one of the priorities of care for Mr. Gordon have included a review at the bedside of his current condition and treatment therapies with respect for the possibility that the patient might be able to hear the discussion, even though he is not able to communicate with the staff? What evidence in nursing literature provides guidance for evidence-based practice for the student when caring for an unresponsive patient?

Informatics: Can you identify essential information that should be documented in Mr. Gordon's electronic record regarding physical assessments and electronic monitoring in addition to efforts to communicate with this patient? Do you think the understanding you gained from this situation improves your ability to care effectively for other comatose patients and communicate respect and emotional support?

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

The **message** is the actual communication product from the source. It might be a speech, interview, conversation, chart, gesture, memorandum, or nursing note. The **channel** of communication is the medium the sender has selected to send the message. The channel might target any of the receiver's senses. The message can be sent to the receiver through the following channels:

- Auditory—spoken words and cues
- Visual—sight, observations, and perception
- Kinesthetic—touch

Nurses use all three of these channels to communicate with patients and other health care providers.

The receiver (decoder) must translate and interpret the message sent and received. Through the translation of the message, the receiver must then make a decision about an accurate response. To be an effective communicator, the nurse needs to be considerate of the receiver, and select a message that appeals to the patient's interests and that requires minimal effort and time to decode.

Recall **Randolph Gordon**, the middle-aged man who is comatose. When planning Mr. Gordon's care, the nurse would need to incorporate knowledge about changes in mental status and their effect on communication. The patient's current mental status mandates that the messages sent to the patient by the nurse and other health care providers be simple, clear, and easy to understand.

Confirmation of the message provides **feedback** (i.e., evidence) that the receiver has understood the intended message. **Noise**—factors that distort the quality of a message—can interfere with communication at any point in the process. These distractors might be from the television, or from pain or discomfort experienced by the patient.

Communication is a reciprocal process in which both the sender and the receiver of messages participate simultaneously. The communication process is illustrated in Figure 8-1. Messages might be influenced on either end by the person's previous knowledge, past experiences, feelings, or sociocultural level.

Read the situation in Box 8-1 (on page 176) and test your knowledge and use of communication.

FORMS OF COMMUNICATION

The sending and receiving of messages is accomplished through verbal and nonverbal communication techniques. These can occur separately or simultaneously. Nurses must consider both verbal and nonverbal communication when sending and interpreting communicated messages.

Verbal Communication

Verbal communication is an exchange of information using words, including both the spoken and written word. Verbal communication depends on **language**, or a prescribed way of using words so that people can share information effectively. Language includes a common definition of words and a method of arranging the words in a certain order.

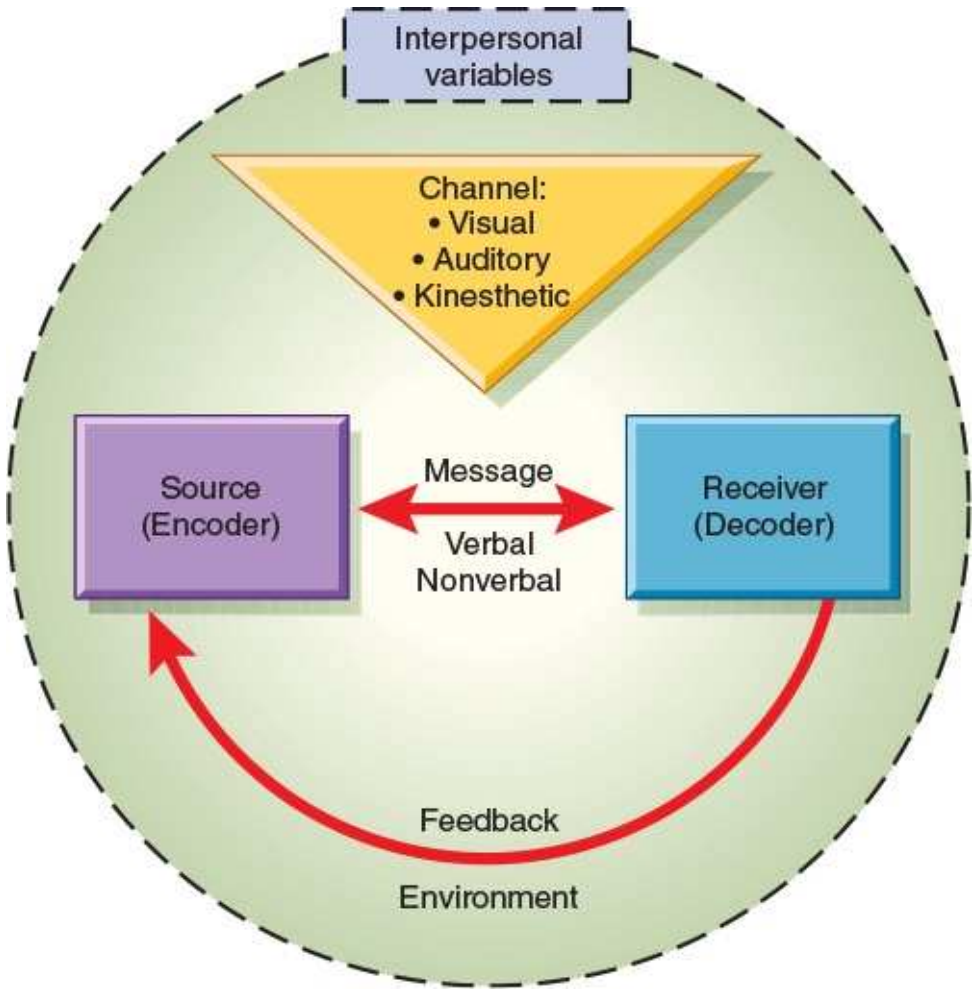

FIGURE 8-1. The various components in the process of communication.

A person's use of written and spoken language forms reveals aspects of the person's intellectual development, educational level, and geographic and cultural origin. Nurses must also consider whether English is a second language for the patient. Language helps nurses assess what the patient knows and feels. In turn, nurses must develop their own language skills to assist in reciprocal responses in the communication process.

Think back to **Irwina Russellinski**, the older adult woman transferred to a long-term care facility after treatment for pneumonia. According to her health record, the patient speaks "broken English." Therefore, the nurse must incorporate knowledge of this when attempting to communicate verbally with the patient, making adaptations during the interaction to ensure that messages are clear.

Nurses use verbal communication extensively when providing patient care, including verbal interactions with patients and family, collaborating with the health care team, developing plans of care, and evaluating patient progress. Other examples of verbal communication include public speaking, collaboration for publication, and dissemination of health information. Words and language in the previous examples communicate messages to others.

Nonverbal Communication

The transmission of information without the use of words is termed **nonverbal communication**. Nonverbal communication includes facial expressions, eye contact, space, time, boundaries, and body movements (Videbeck, 2020). Nonverbal communication is as important as verbal communication, if not more so (Videbeck, 2020). Nonverbal communication often helps to understand subtle and hidden meanings in what the patients or others are saying verbally (Keltner & Steele, 2019). For example, a nurse asks the patient, "How do you feel today?" The patient responds, "I feel all right." However, the nurse notes that the patient does not maintain eye contact and his facial expression is tense. This should prompt the nurse to investigate further because of the incongruence of the patient's verbal and nonverbal communication (Fig. 8-2).

Box 8-1	Communication Challenges

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Picture yourself walking into a patient's room to administer a pain medication by intravenous injection. What do you see yourself communicating through each of the three channels of communication?

Then, read the following and think about all the ways nurses might unintentionally communicate that they are not concerned about the patient or his pain. Use this exercise to guide both your verbal and nonverbal messages to patients.

Channel	Mode of Transmission	Outcome	Nursing Behavior
Visual	Sight	Receiving a visual stimulus	Patient sees nurse walking into the room holding desired medication.
	Observation	Interpreting a visual stimulation by making note of nonverbal enhancement	Patient makes note of the nurse's sense of competence, confidence, and sympathetic expression.
	Perception	Assigning meaning to a visual event	Patient concludes that the nurse is willing and able to help him and feels comforted.
Auditory	Hearing	Receiving an auditory stimulus	Patient hears the nurse say, "I understand your hip is hurting. This medication should help you to start feeling better within minutes."
	Listening	Gaining awareness of underlying messages and feelings accompanying auditory events	Patient senses that the nurse said he should start feeling better soon and really wants this to happen because she cares about him.
Kinesthetic	Procedural touch	Performing nursing procedures and techniques	Patient feels the nurse touching him while preparing to inject the medication into the IV access.
	Caring touch	Conveying emotional support	Patient feels that the nurse cares about him as a person when she touches his shoulder upon first entering the room while asking about his pain.

Consider **Susie Musashi**, the 3-year-old described at the beginning of the chapter. Interpretation of her nonverbal behavior is essential to implementing an effective plan of care. For example, the nurse needs to interpret what the child's crying indicates, such as fear, pain, or loneliness. In addition, the nurse needs to examine the meaning of the child's turning away from the door. Does she want to be left alone? Is she frightened? Once this information is obtained and analyzed, the nurse is better equipped to develop a plan of care to meet Susie's needs.

Information is exchanged through nonverbal communication in various ways. Body language may mirror or enhance what is verbally communicated (Keltner & Steele, 2019). When verbal and nonverbal communication do not match,

nonverbal communication often conveys the speaker's actual meaning (Videbeck, 2020). Consequently, if verbal and nonverbal messages conflict, behaviors can negate a verbal message and the listener will believe the nonverbal message (Boyd, 2018; Keltner & Steele, 2019). Therefore, nurses must be aware of both the nonverbal messages they send and the nonverbal messages they receive from patients. Nurses working with patients from diverse cultural backgrounds should attempt to understand cultural variations to avoid misunderstanding nonverbal communication. The various forms of nonverbal communication follow.

Touch

Touch (a person's tactile sense) is a very personal behavior and means different things to different people. Familial, regional, class, and cultural influences largely shape tactile experiences. Factors such as age and sex also play a key role in meanings associated with touch. Despite its individuality, touch is viewed as one of the most effective nonverbal ways to express feelings of comfort, love, affection, security, anger, frustration, aggression, excitement, and many others.

Recall **Mr. Gordon**, the patient with end-stage liver disease who is in a coma. Although the patient may not respond verbally or be able to comprehend, the nurse could use touch to indicate concern and respect for the patient, thus sending a message that someone is there for him.

FIGURE 8-2. Eye contact, the lack of it, facial expression, posture, gesture, and silence send nonverbal messages to the receiver. What messages do you receive from each of these photographs?

Eye Contact

Communication often begins with eye contact, looking into the other person's eyes. A glance, for example, is often an attention-getting method to open conversation. In many cultures, eye contact suggests respect and a willingness to listen and to keep communication open. Its absence often indicates anxiety or defenselessness, or avoidance of communication. Some view eye contact as the nonverbal communication that reveals a person's true nature. However, some Native American and Asian cultures view eye contact as an invasion of a person's privacy or as confrontational. In other cultures, people are taught to avoid eye contact or, out of respect, not to make eye contact with a superior.

In addition to the messages sent by eye contact, the eyes carry other nonverbal messages. For example, the eyes fix in

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

a stare during anger, tend to narrow in disgust, and ordinarily open wide in fear. Some people who experience fear might be unable to speak and only their eyes will send the message of anxiety. A blank stare can indicate daydreaming or inattentiveness.

Facial Expressions

The face is the most expressive part of the body. Examples of the various messages facial expressions convey are anger, joy, suspicion, sadness, fear, and contempt. Some people have extremely expressive faces, whereas others mask their feelings, making it more difficult to determine what the person is really thinking. Nurses need to learn to control their own facial expressions.

Consider **Susie Musashi**, the 3-year-old with burns. Preschoolers are naturally curious. So, she might watch the nurse's reaction when the nurse changes the burn dressings for the first time. Any sign of repulsion or disgust could greatly impact the child's self-image and recovery.

Posture

The way a person holds the body carries nonverbal messages. People in good health and with a positive attitude usually hold their bodies in good alignment. Depressed or tired people are more likely to slouch. Posture also often provides nonverbal clues concerning pain and physical limitations, for instance, a rigid, stiff appearance might be a good indicator of tension and pain.

Gait

A bouncy, purposeful walk usually carries a message of well-being. A less purposeful, shuffling gait often means the person is sad or discouraged. Certain gaits are associated with illness. For example, patients recovering from recent abdominal surgery usually walk slightly bent over and slowly and might need the assistance of handrails or a helping person.

Gestures

Gestures using various parts of the body can carry numerous messages—for example, thumbs up may mean victory, kicking an object often expresses anger, wringing the hands or tapping a foot usually indicates anxiety or anger, and a waving hand serves to beckon someone to come on, or if waved in another way, signifies that someone should leave. Gestures are often used extensively when two people speaking in different languages attempt to communicate with each other. Gestures may have different meanings in different cultures, and nurses must consider how culture influences the meaning (Tuohy, 2018).

Remember **Mrs. Russellinski**, the 75-year-old recovering from pneumonia. Gestures would be very helpful in communicating with the patient, especially in light of the patient's hearing and language deficits.

General Physical Appearance

Many illnesses cause at least some alterations in general physical appearance. Observing for changes in appearance is an important nursing responsibility for detecting illness or evaluating the effectiveness of care and therapy. For example, a person with an insufficient intake of fluids has dry skin that wrinkles easily, eyes that might be sunken and dull in

appearance, and poor muscle tone. On the other hand, the person in good health tends to radiate a healthy status through general appearance.

Mode of Dress and Grooming

A person's clothing and grooming practices carry significant nonverbal messages. For example, healthy people tend to pay attention to details of dress and grooming, whereas people feeling ill often demonstrate little interest in personal appearance. It is often a sign of returning health when interest in their physical appearance and mode of dress returns.

Sounds

Crying, moaning, gasping, and sighing are oral but nonverbal forms of communication. Such sounds can be interpreted in numerous ways. For example, a person might cry because of sadness or joy. Gasping often indicates fear, pain, or surprise. A sigh might be a sign of reluctant agreement to do something or of relief.

Silence

Periods of silence during a conversation often carry important nonverbal messages. A silence between two people might indicate complete understanding of each other, that both are thinking, or that they are angry with each other. Silence and its possible uses and meanings are discussed later in this chapter.

Communication Technologies

Electronic Communication

The Internet and a variety of social websites provide new and challenging opportunities for nurses to communicate and collaborate with other health care providers. The challenges of using social media include protecting patient privacy and confidentiality and preventing unintended consequences for the employer or the nurse. Protocols for using e-mail, sending text messages, and accessing the social media sites are vital for wise use of these forms of electronic communication. Student nurses also must know these guidelines for use of electronic communication venues. Educational institutions should orient students to professional expectations as well as clearly defined policies and procedures regarding use of electronic communication and social networking policies (Daigle, 2020). Increased exposure to these expectations can foster the development of an ethical conscience that begins when one is a student and carries into future practice (Daigle, 2020).

Social Media

Social media are web-based technologies that allow users to create, share, and participate in dialogue in virtual communities and networks. The availability of social media sites has dramatically changed communications among people, communities, and organizations. Social media networks allow nurses to share ideas, develop professional connections, access educational offerings and forums, receive support, and investigate evidence-based practices (Chan & Leung, 2018). Facebook, WhatsApp Messenger, Twitter, and LinkedIn are common social media sites used by nurses and other health care professionals (Chan & Leung, 2018). Concerns about social media occur when nurses inadvertently reveal information about patients that compromise the patients' privacy. Nurses must adhere to Health Insurance Portability and Accountability Act (HIPAA) regulations that protect patient confidentiality and privacy and be aware of their employers' policies about using social media. Health care facilities may specifically address personal use of computers in the facility and types of websites that may be accessed during working hours from employer computers. Health care facility policies often do not address employee use of social media when not at work, but disclosing information that violates the privacy and confidentiality of patients or professional standards and posting defamatory remarks about an employer, supervisor, coworker, or patient have serious consequences for nurses (National Council of State Boards of Nursing [NCSBN], 2018). Nurses are accountable for their use of social media and can be reported to a regulatory authority for an allegation of inappropriate use of social media, reflective of deviation from required professional competencies and standards for practice (Scruth et al., 2015).

Both the American Nurses Association (ANA) and the NCSBN have issued guidelines for RNs regarding use of social media. These organizations agree that professional boundaries must be followed in the social media environment. Refer to Box 8-2 for a discussion of the six principles for social networking relevant to registered nurses and nursing students endorsed by the ANA.

Often, inappropriate disclosures of information are unintentional. Nurses may expect that information they post is private, but, in reality, it can be shared with multiple other recipients. It is also incorrect to assume that once information has been deleted from a site, it is no longer available. Describing a patient by using a room number or diagnosis rather than a name is still considered a breach of confidentiality and a violation of patient privacy.

Box 8-2 **American Nurses Association's Principles for Social Networking**

1. Nurses must not transmit or place online individually identifiable patient information.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

2. Nurses must observe ethically prescribed professional patient–nurse boundaries.
3. Nurses should understand that patients, colleagues, institutions, and employers may view postings.
4. Nurses should take advantage of privacy settings and seek to separate personal and professional information online.
5. Nurses should bring content that could harm a patient's privacy, rights, or welfare to the attention of appropriate authorities.
6. Nurses should participate in developing institutional policies governing online conduct.

Source: Reprinted with permission from American Nurses Association (ANA). (2011). *ANA's Principles for social networking and the nurse*. Author. © 2011 By American Nurses Association. Reprinted with permission. All rights reserved.

Potential consequences for inappropriate use of social and electronic media by nurses vary, depending, in part, on the particular nature of the nurse's conduct (NCSBN, 2018). Inappropriate use of social and electronic media may be reported to the nurse's state board of nursing; reports of inappropriate disclosure by a nurse may be investigated on the grounds of unprofessional conduct, unethical conduct, moral turpitude, mismanagement of patient records, and/or breach of confidentiality (NCSBN, 2018). Disciplinary action by the board of nursing could include a reprimand or sanction, monetary fine, or temporary or permanent loss of licensure (NCSBN, 2018). In addition, improper use of social media by a nurse may violate state and federal laws related to patient privacy and confidentiality, with the potential for civil and criminal penalties, including monetary fines and possible incarceration (NCSBN, 2018). Employers may use social media to screen potential employees as long as they do not violate discrimination laws. Any information you have provided about yourself on a social media website may influence a hiring decision. In addition, you could also face employment consequences, including loss of employment, if content or conduct on a social media site violates the policies of an employer (NCSBN, 2018; Scruth et al., 2015).

The responsibility for understanding the use of social media to maintain professional standards lies with the practitioner. The ease with which information can be posted on a social media site allows minimal time to consider the implications and the effect a posting can have on a nurse's personal and professional life (NCSBN, 2018). Clear professional boundaries should be established by educational institutions for nursing students upon entry into nursing programs to support safe use of social media and to promote a positive image for the nursing profession (Daigle, 2020).

E-Mail and Text Messages

E-mail and text messages are efficient means to communicate with staff members and, in some cases, patients. The risk for violating patient privacy and confidentiality exists any time a message is sent electronically. Health care facilities usually have security measures in place to safeguard e-mail and text communications. E-mail and text messages should be concise and avoid text abbreviations. Nurses should be aware of facility policies and guidelines regarding the use of electronic communication with patients. The patient may have to sign an authorization permitting e-mail communication from the health care facility. Any e-mails sent to a patient must be duplicated and become part of the health record for that patient. While e-mail and text messages are additional communication tools, it is always necessary to follow facility policies and adhere to your professional code of conduct. Individualizing patient care requires nurses to determine which form of communication is most beneficial for each patient.

Telehealth and Telemedicine

Health and mobile health technologies make use of telecommunications and virtual technology to deliver health care services and health-related information outside of traditional health care facilities (Koivunen & Saranto). These technologies are used to support and promote long-distance clinical health care, patient and professional health-related education, public health, and health administration (The Office of the National Coordinator for Health Information Technology, 2017). Telehealth nursing uses technology to deliver nursing care and conduct nursing practice remotely to improve efficiency and patient access to health care (Adzhigirey et al., 2019). The use of connected health technologies does not alter the standards of professional practice (American Nurses Association, 2019). Effective communication between the patient and nurses is a significant part of provision of effective nursing care. The use of effective communication skills is essential to ensure successful telehealth encounters, positive patient experiences, and successful interprofessional collaboration (Sweeney Gustin et al., 2020). Both verbal and nonverbal communication skills impact and contribute to successful telehealth visits and collaboration (Sweeney Gustin et al., 2020). When engaging in telehealth activities, nurses should dress professionally; decrease distractors, such as environmental noise and clutter; ensure privacy and lack of interruptions; and make use of key nonverbal cues, including leaning in, nodding, and making eye contact, to communicate interest, empathy, and engagement with the patient or professional (Sweeney Gustin et al., 2020). Being a good listener is also essential (Mataxen & Webb, 2019). Telehealth nurses make use of clinical knowledge, technical skills, and communication skills to prioritize, initiate, and evaluate patient care.

LEVELS OF COMMUNICATION

Throughout our lives and the lives of our patients, communication occurs at varying levels. Nurses engage in four levels of communication during practice: intrapersonal communication, interpersonal communication, small-group

communication, and organizational communication.

Intrapersonal Communication

Intrapersonal communication, or self-talk, is communication within a person. This communication is crucial because it affects the nurse's behavior and can enhance or detract from positive interactions with the patient and family. Imagine two different nursing students preparing for the first experience with a critically ill patient. Both are frightened. One tells herself, "Calm down, you've been in challenging situations before and always survived. You can handle this." The other repeatedly tells himself, "There's no way you can survive this experience. The instructor will be all over you, and you might as well admit defeat before you start." Obviously, the first student's positive self-talk is more helpful than that of the second student.

Consider **Susie Musashi**, the 3-year-old receiving treatment for her burns. The nurse may use self-talk when preparing to interact with the child, thereby helping her to focus on the child and her behaviors. In doing so, the nurse may be better able to interpret the child's messages. The nurse might say to herself, "I will use broad opening statements to help the patient and family express their feelings. I will talk to the patient on her level. I must maintain eye contact with the patient and family and answer their questions. I will not make light of the situation or appear unconcerned."

Understanding the importance of intrapersonal communication can also help you to work with patients and families whose negative self-talk affects their health and self-care abilities.

Interpersonal Communication

Interpersonal communication occurs between two or more people with a goal to exchange messages. Most of the nurse's day is spent communicating with patients, family members, and members of the health care team. The ability to communicate effectively at this level influences your sharing, problem solving, goal attainment, team building, and effectiveness in critical nursing roles (e.g., caregiver, teacher, counselor, leader, manager, patient advocate).

Group Communication

Group communication includes small-group and organizational group communication. To determine the effectiveness or ineffectiveness of a group, one studies the group dynamics.

Small-Group Communication

Small-group communication occurs when nurses interact with two or more people. To be functional, members of the small group must communicate to achieve their goal. Examples of small-group communication include staff meetings, patient care conferences, teaching sessions, and support groups. The more people involved in the communication process, the more complex it becomes.

Organizational Communication

Organizational communication occurs when people and groups within an organization communicate to achieve established goals. Nurses on a practice council working to review unit policies or nurses working with interdisciplinary groups on strategic planning or quality assurance use organizational communication to achieve their aims.

Group Dynamics

When determining the effectiveness or ineffectiveness of a group, one studies the group dynamics. **Group dynamics** involve how individual group members relate to one another during the process of working toward group goals.

Although effective leadership facilitates a group's achievement of its goals, success or failure largely results from members' behavior and associated communication. Ideally, all group members use their talents and interpersonal strengths to help the group to accomplish its goals. The group's ability to function at a high level depends on each member's sensitivity to the needs of the group and its individual members. Effective groups have members who are mutually respectful. If a group member dominates or thwarts the group process, then the leader or other group members must confront that member to promote the needed collegial relationship. Effective and ineffective groups are contrasted

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

in Table 8-1.

FACTORS INFLUENCING COMMUNICATION

Factors influencing communication include level of development; sociocultural differences; roles and responsibilities; space and territoriality; physical, mental, and emotional state; and environment.

Developmental Level

The rate of language development is directly correlated with the patient's neurologic competence and cognitive development. Thus, it is helpful to understand the process of language development and the stages of intellectual and psychosocial development. This helps you communicate effectively with patients and family of all age ranges.

Table 8-1 Characteristics of Effective and Ineffective Groups

VARIABLE	EFFECTIVE GROUP	INEFFECTIVE GROUP
Group identity	Members value and "own" the aims of the group; aims are clearly articulated.	Group's aims are not of major importance to members. Members accept imposed goals.
Cohesiveness	Members generally trust and like one another and are loyal to the group; high commitment; high degree of cooperation.	Members often feel alienated from the group and from one another; low commitment; members tend to work better alone than with the group.
Patterns of interaction	Honest, direct communication flows freely and is two-way; members support, praise, and critique one another.	Communication is sparing and/or one-way; little self-disclosure; self-serving roles (i.e., dominator, blocker, or aggressor) may be unchecked.
Decision making	Problems are identified, appropriate method of decision making is used (i.e., individual, minority, majority, consensus, or unanimous); decision is implemented and followed through; group commitment to decision is high.	Problems are allowed to build without resolution; little responsibility is shown for problem solving; group commitment to decision is low.
Responsibility	Members feel strong sense of responsibility for group outcomes.	Little responsibility for group felt by group members.
Leadership	Effective style of leadership meets desired aims. Participation and leadership are distributed among all members.	Ineffective leadership styles are used. Leadership is delegated and based on authority.
Power	Sources of power are recognized and used appropriately; needs or interests of those with little power are considered.	Power is used and abused to "fix" immediate problems; little attention to needs of powerless.

(2018). *Psychiatric mental health nursing: Concepts of care in evidence-based practice* (9th ed.). F.A. Davis Company; and Videbeck, S. L. (2020). *Psychiatric mental health nursing* (8th ed.). Wolters Kluwer.

Remember **Susie Musashi**, the 3-year-old child with burns. The nurse would incorporate knowledge of the typical preschooler fears (such as fear of new places and fear of the dark) when developing the child's plan of care. Preschoolers gain self-esteem by receiving compliments about their appearance. The presence of the burns directly affects the child's appearance, possibly threatening self-esteem. Therefore, the nurse also needs to consider the child's current fears related to her burns and burn treatment and their effect on the child's self-esteem.

The stages of development are presented in Chapters 22, 23, and 24. Knowing how each age group commonly perceives health, illness, and body functions should guide your interactions with patients. For instance, a 10-year-old child has limited understanding of what an infection is; therefore, explain things in simple terms so that the child cooperates with the treatment without being frightened. Because adolescents are developing abstract thinking, more detailed and accurate explanations can be given to them. Being familiar with commonly used slang usually helps when communicating with adolescents. Communicating with adults can be affected by their past positive or negative health-related experiences and by inaccurate information. When communicating with older adults, assess for any problems with hearing or sight (discussed later in this chapter, on pages 202–203), confusion, or depression, any of which could affect nurse–patient interaction.

Sociocultural Differences

Nurses need to recognize ways in which culture and social determinants of health, such as economic condition, education and literacy (including health literacy), and overall lifestyle influence a patient's functioning and preferred mode of communicating. This will help you understand what the patient understands. Detailed discussion of considerations related to social determinants of health and health care are provided in Chapters 3 and 4.

Culture refers to the common lifestyles, languages, behavior patterns, traditions, and beliefs that are learned and passed from one generation to the next. Development of cultural competence requires becoming aware of your own personal cultural beliefs and identifying prejudices or attitudes that could affect interactions with persons different from you or be a barrier to good communication (Kersey-Matusiak, 2019). Likewise, understanding a patient's culture helps you understand nonverbal communication and deliver appropriate nursing care to the patient and family. For example, women in some cultures may speak of personal concerns only to their spouses; in such instances, a maternal care nurse might talk with the patient's husband about the woman's postdelivery care. Additional discussion of culture and provision of person-centered culturally respectful care is provided in Chapter 5.

According to Census Bureau data from the 2017 American Community Survey, the number of U.S. residents who speak a language other than English at home has reached an all-time high: one in five (Zeigler & Camarota, 2018). Patients with limited proficiency in English have difficulty understanding health care instructions, understanding test results and diagnoses, and participating in treatment decisions (Chung et al., 2020). Low health literacy and, difficulty understanding and using health information compound these issues (The Joint Commission, 2020a). In addition, the health care system is a culture with its own customs, values, and language. Try to remain aware of these cultural variations and be careful to use lay terminology when speaking with patients, unless you know that the patient is a health care professional. Use of medical terminology (e.g., myocardial infarction for heart attack, cerebrovascular accident for stroke [brain attack], or cholecystectomy for gallbladder operation) or abbreviations usually alienates patients and can inhibit further communication. Detailed discussion of considerations related to health literacy is provided in Chapter 9.

A patient's language proficiency, support system, cultural preferences, and socioeconomic circumstances should be evaluated upon contact with health care services and admission to health care facilities to facilitate communication and improve the quality of care (Moscrop et al., 2019). The Joint Commission (2020a) recommends an approach to communicating health information that encompasses language needs, individual understanding, and cultural and other communication issues. Nurses and other health care providers should be adaptive and culturally sensitive to patient needs to ensure effective communication; thoughtful, person-centered care; and improved patient outcomes (Chung et al., 2020; Tuohy, 2019).

Roles and Responsibilities

Patients function through various roles and responsibilities; the number and types of roles vary but may include family

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

(child, spouse, partner), occupation (student, employer), and activities (club member, choir member) (Videbeck, 2020). Identification of the role or roles a person occupies may give the nurse some insight into the person's identity. Stereotyping a person according to a role or roles, however, can be misleading and should be avoided. This can be hazardous, for instance, when nurses assume that patients who are health care professionals know everything about their condition and need little nursing assistance, teaching, and counseling.

The challenge in the provision of care is to respect the patient's roles and responsibilities, especially because these roles influence their preferred manner of communicating, without denying the patient needed care. For example, a successful attorney might have a "take-charge" demeanor and seem utterly self-sufficient; a skilled nurse will note this but still provide an opening for the patient to verbalize their needs. "You seem well prepared for this procedure and in control, but I know that patients often have questions that never get answered or fears that remain unvoiced. Is there anything I can help you with while I'm here?" Similarly, be careful not to ignore an uncomplaining patient (occupying the role of patient) who never asks for anything, because the power differences in the health care professional–patient relationship may make communication intimidating.

Space and Territoriality

People are most comfortable in areas they consider their own. We generally feel relief when we come home, take our shoes and professional clothes off, and relax. This urge to maintain an exclusive right to certain space is termed territoriality. You might have already noticed that patients behave differently when being interviewed in their homes, at a health fair in the mall, or in an institutional setting. Similarly, health care professionals might behave differently when they are "on their own turf" in a health care setting compared to when they enter a patient's home as a guest caregiver. It is important to understand how territoriality influences the nurse–patient relationship.

The actual physical difference between the nurse and patient during interaction is also important. *Proxemics* is the study of distance zones between people during communication (Videbeck, 2020). Each person has a sense of how much personal or private space is needed and what distance between people is optimum. Figure 8-3 demonstrates the four communication zones. Activities that are likely to occur during each of these zones include:

- Intimate zone: interaction between parents and children or people who desire close personal contact
- Personal zone: distance when interacting with close friends
- Social zone: space when interacting with acquaintances such as in a work or social setting
- Public zone: communication when speaking to an audience or small groups

An understanding of personal space and distancing characteristics can enhance the quality of communication (Videbeck, 2020). Some aspects of communication zones are dictated through culture, and some are idiosyncratic. Anywhere from 18 in to 4 ft might be optimal distance to sit from a patient during an intake interview. For example, some European Americans and African Americans might require more personal space between two people who are speaking than some people in other cultures (Mediterranean, Hispanic, Asian, Middle Eastern, East Indian) who might be comfortable at a closer distance when speaking (Videbeck, 2020). It is best to take cues from patients, noting whether they are moving backward from you if you are too near or leaning forward to get closer to you. Because many nursing interventions place one in proximity to a patient and entail forced intimacy, be sensitive to how offensive this might be to certain patients who are accustomed to large areas of private space. Develop the habit of seeking the patient's permission before entering the intimate or personal zone (Videbeck, 2020). Although most people consider their hands, arms, shoulders, and back within a social zone, increased levels of privacy are accorded to (1) mouth and feet; (2) face, neck, and front of body; and (3) genitalia.

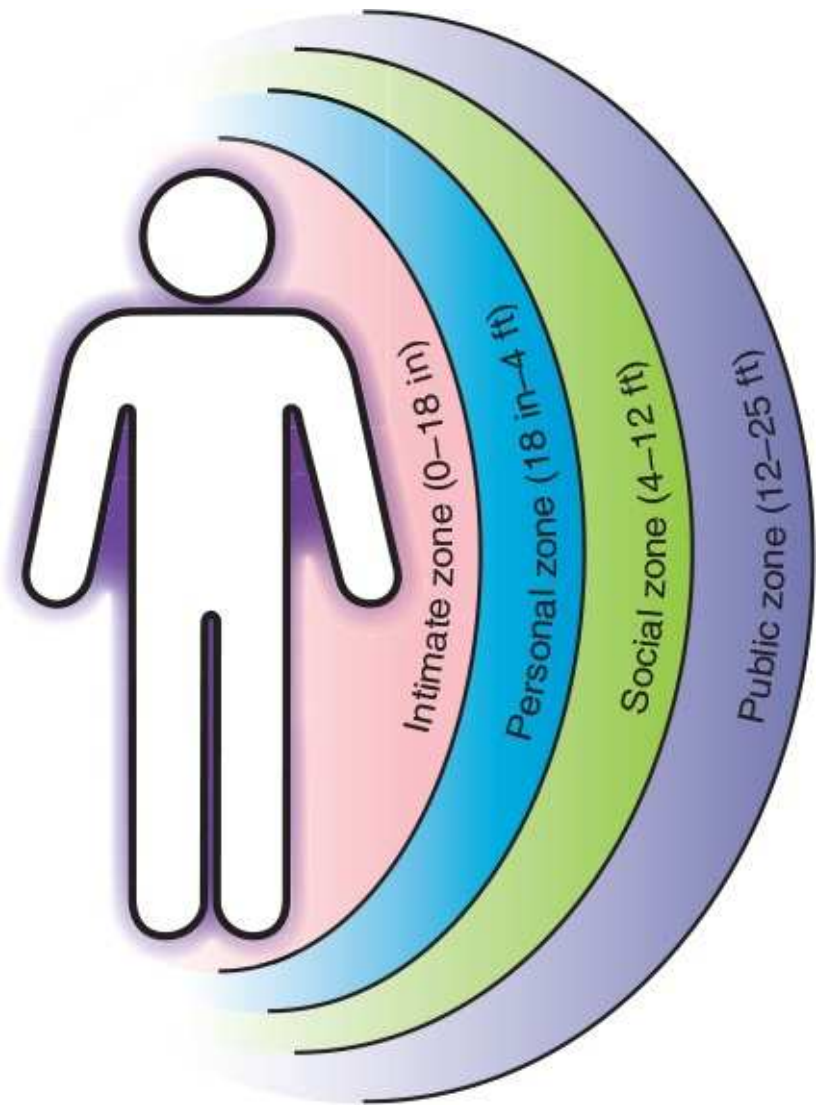

FIGURE 8-3. These four distance zones around the body are recognized as communication zones.

Physical, Mental, and Emotional State

The degree to which people are physically comfortable and mentally and emotionally free to engage in interactions also influences communication. A full bladder, a dull headache, crushing chest pain, anxiety about a pending diagnosis or concern about what is happening at home or at work, and fear can all negatively influence communication. For example, patients who think that a nurse wants to hurt them will be difficult to interview. Be sensitive to the patient's physical, mental, and emotional barriers to effective communication.

Cognitively impaired patients and patients with other communication difficulties present special communication challenges. For example, an older adult who has dementia and is agitated due to pain from an abscessed tooth might be unable to communicate with the nurse. Nurses and other health care providers must consider augmentative and alternative communication (AAC) strategies to adjust conversation when providing care to "communication vulnerable" patients (Stans et al., 2018). AAC strategies include formal assistive communication systems (e.g., voice communication aids), handwriting, pictograms, and gesturing (Stans et al., 2018).

Remember **Irwina Russellinski**, the 75-year-old woman who was described as "being pleasantly confused" at times and requiring an initial nursing assessment. The patient's level of confusion presents challenges for the nurse when eliciting information for the nursing history. This challenge could be further complicated by the patient's limited use and understanding of English. The nurse needs to speak clearly, distinctly, and in terms that the patient understands, asking for clarification as needed. The nurse should make use of translation resources provided by the long-term facility. In addition, the nurse needs to allow ample time for the patient to respond and explore other sources for needed information. It is important for the nurse to convey patience and caring through nonverbal measures.

Values

Communication is influenced by the way people value themselves, one another, and the purpose of any human

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

interaction. For example, nurses who believe that teaching is an important aspect of nursing and who value empowering patients will communicate this to patients. Conversely, a nurse who believes teaching is an unimportant chore is unlikely to be an effective teacher. Similarly, the patient's motivation (or lack of motivation) to develop new self-care behaviors cannot help but influence nurse–patient communication.

Environment

Communication happens best when the environment facilitates an easy exchange of needed information. The environment most conducive to communication is one that is calm and nonthreatening. The goal is to minimize distractions and ensure privacy. The use of music, art, and interior decorations might help put the patient at ease. A patient with newly diagnosed human immunodeficiency virus (HIV) infection may find it difficult to discuss sexual history or genital warts in an area that lacks privacy. A toddler might find it easier to communicate if a parent, favorite stuffed animal, or blanket is nearby.

USING PROFESSIONAL COMMUNICATION IN THE NURSING PROCESS

The ability to communicate with patients, other nurses, and other health care professionals is essential for effective use of the nursing process. Knowledge of the communication process and effective communication techniques is fundamental to all steps of the nursing process. At the same time, the nursing process provides the guidance and direction needed to communicate in a professional manner clearly, effectively, and compassionately.

Assessing

The major focus of assessment is to gather information in both verbal and nonverbal communication forms. Before the assessment, the nurse should determine if the patient needs any assistive devices in order to communicate effectively and understand conversations (e.g., hearing aid, glasses, etc.). Identify the patient's preferred language and secure an interpreter if one is needed, or plan for use of other AAC strategies to address patient communication needs (Stans et al., 2018).

The written word is used to obtain patient data and when reading patients' records or charts before meeting them. The spoken word is used to give and to receive reports to and from other health personnel. This is commonplace when admitting a patient to a hospital unit or before visiting the patient at home. One-to-one communication is used with patients to obtain thorough nursing histories, physical examinations, and other assessments. Effective communication techniques, as well as observational skills, are used extensively during this phase. The data collected verbally and nonverbally are analyzed, documented, and shared with appropriate people through oral and written communication.

Examples of Actual or Potential Health Problems and Needs

COMMUNICATION		
Actual or Potential Health Problems and Needs	**Possible Etiologic Factors**	**Potential Signs and Symptoms**
Impaired Verbal Communication	• Insufficient stimuli • Cultural incongruence • Physiologic condition • Alteration in perception • Emotional disturbance	• Difficulty speaking • Slurred speech • Inappropriate verbalization • Disoriented to person, place, or time • Inability to speak language of caregiver
Hearing Impairment	• Congenital condition • Physiologic condition • Consequence of aging • Chronic exposure to loud noises	• Lack of response to verbal queries/directions • Inappropriate verbalization • Difficulty understanding verbal communication • Frequently asking to have conversation repeated

Diagnosing Actual or Potential Health Problems and Needs

An assessment of the patient may lead to the identification of one or more actual or potential health problems and needs related to communication. Following the formulation of the actual or potential health problems and needs, the nurse communicates findings to other nursing and health care professionals through the use of the written and spoken word. The written actual or potential health problem or need becomes a permanent part of the patient's health record. Examples of health problems and needs with related etiology and signs and symptoms can be found in the box titled Examples of Actual or Potential Health Problems and Needs: Communication.

Outcome Identification and Planning

The planning step requires communication among the patient, nurse, and other team members as mutually agreed-upon outcomes are developed and interventions are determined. Because a nurse is rarely able to implement all parts of a plan alone, oral and written communication is needed to inform others of what needs to be done to meet the set objectives or goals. The formal written plan of care is a form of communication. Without communication, the plan of care could not be implemented and continuity in care would not be possible.

Implementing

Nurses assume many roles when they implement the plan of care. Verbal and nonverbal communication methods enhance basic caregiving measures and are used to teach, counsel, and support patients and their families during the implementation phase. Even a simple nursing intervention, such as "encourage patient to drink 100 mL of fluid every hour while awake," requires countless messages to be sent and received between the nurse and the patient and the nurse and other nurses and health care providers. The nurse explains the importance of an adequate fluid intake, along with the amount and frequency of intake. The nurse communicates the plan to others involved in the care of the patient. The patient, in turn, speaks of their preference for fluids and ability or inability to meet targeted objectives. The patient's verbal and nonverbal messages are assessed during each nurse–patient interaction. The implementation of the nursing care plan is then documented in the patient's record.

Evaluating

Nurses often rely on verbal and nonverbal cues from patients to verify whether patient objectives or goals have been achieved. Communication, through the exchange of positive and negative messages between the nurse and the patient, also facilitates the revision of parts of the plan of care.

DOCUMENTING COMMUNICATION

Continual assessment of the patient's needs and conditions requires accurate documentation in the appropriate location. Because one nurse cannot provide 24-hour coverage for patients, significant information must be passed on to others; effective communication among health care professionals is essential to the coordination and continuity of thoughtful, person-centered care. The use of various forms of documenting and reporting, including nursing progress notes and plans of care, are important parts of effective communication. Documentation, reporting, and the use of electronic communication are discussed in detail in Chapter 20.

EFFECTIVE PROFESSIONAL COMMUNICATION

Cooperation, coordination, and collaboration in interactions between nurses and other health care professionals are a vital part of the provision of safe, effective, high-quality, nd thoughtful person-centered care. Effective professional communication is an integral aspect of these interactions, supporting the continuum of teamwork necessary to deliver patient care (Bochatay, 2019; Tingle, 2018). Nurses and other health care professionals utilize various communication processes, including hand-off communication and other structured communication techniques, to support effective exchange of information.

Hand-off Communication: SBAR

A "hand-off" occurs when the responsibility for care is transferred from one care provider to another (PSNet, 2019). Hand-off communication involves the process of accurate presentation and acceptance of patient-related information from one caregiver or team to another caregiver or team. Hand-off communication occurs between nurses and other departments in the facility, during nurse-to-nurse report, or in nurse-to-other health care professional discussions and occurs numerous times per day. However, miscommunication between health care providers during hand-off communication and inadequate hand-off communication are significant contributing factors to adverse patient events, such as wrong-site surgery, delay in treatment, falls, and medication errors (The Joint Commission, 2017; PSNet, 2019).

In an effort to eliminate breakdowns in communication and potential adverse events, the Joint Commission has included a goal to improve the effectiveness of communication among caregivers as a National Patient Safety Goal (The

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Joint Commission, 2021). Structured communication techniques can help health care team members ensure accuracy and make decisions (Pettit & Duffy, 2015). Implementation of a standardized communication tool has been shown to reduce the risk of transmitting inaccurate and incomplete information (Galatzan & Carrington, 2018). However, standardized hand-off tools "must be flexible to meet various needs of each nurse, nursing unit, health-care environment, and patient situation" (Galatzan & Carrington, p. 485).

The Joint Commission, Joint Commission International, and the Institute for Healthcare Improvement (IHI) have all recommended using the SBAR method to improve hand-off communication (IHI, 2017; The Joint Commission, 2017; Joint Commission International [JCI], 2018). **SBAR**, which stands for **S**ituation, **B**ackground, **A**ssessment, and **R**ecommendations, provides a consistent method for hand-off communication that is clear, structured, and easy to use. This technique was originally developed by the U.S. Navy to accurately transmit critical information, and later adapted by Kaiser Permanente of Colorado to facilitate communication in health care (JCI, 2018). The **S** (Situation) and **B** (Background) provide objective data, whereas the **A** (Assessment) and **R** (Recommendations) allow for presentation of subjective information. The SBAR method has been used to enhance the clarity and efficiency of communication between health care team members (Padgett, 2018). The SBAR format is widely used in health care and can be modified to meet the specific situations related to shift reports, conversations with physicians and other health care providers, and transfer of patients. SBAR has been successfully used to improve hand-off communication, bedside shift report, teamwork, and the perception of patient safety culture (Bonds, 2018; Clark et al., 2020). An electronic SBAR template has been used to improve documentation and communication between nurses and other health care providers (Panesar et al., 2016; Sermersheim et al., 2020). Figure 8-4 (on page 186) provides an example of a basic SBAR communication tool used between a nurse and another health care provider. SBAR is also discussed in Chapters 12, 17, and 20.

Technology Alert

An SBAR template has been implemented as part of electronic documentation. The use of an electronic SBAR hand-off has been associated with improved communication, as well as more complete documentation and increased frequency of documentation of communication among nurses and health care providers (Panesar et al., 2016; Sermersheim et al., 2020).

I-SBAR-R and the QSEN Institute

The Quality and Safety Education for Nurses (QSEN) Institute identifies quality and safety competencies for nursing, with the goal of preparing future nurses with the knowledge, skills, and attitudes necessary to improve the quality and safety of the health care systems within which they work (QSEN, n.d.). QSEN also provides teaching strategies and resources to assist nurse educators to meet the QSEN goals. One such teaching resource suggests a revised SBAR for use with nursing students to improve communication and support safe practice. This adapted form includes the initial identification of "yourself and your patient (**I**)" and the opportunity to ask and respond to questions, or "readback (**R**)," at the close of the communication (Quality and Safety Education for Nurses [QSEN] Institute, 2008). This reformulated **I-SBAR-R** supports clear identification of the nurse and the patient when communicating patient care information or concerns with another health care provider.

SBAR and The Joint Commission: The Hand-Off TST

The Joint Commission Center for Transforming Healthcare developed the Hand-off Communication Targeted Solutions Tool (TST), which examines hand-off communication problems and identifies causes for failures and barriers to improvement (The Joint Commission Center for Transforming Healthcare, n.d.). This tool also provides evidence-based solutions to improve hand-off communication targeted to specific causes of inadequate hand-off at an individual organization (The Joint Commission Center for Transforming Healthcare, n.d.).

Rising Level of Concern Communication: CUS

Structured communication techniques can help health care team members communicate effectively and accurately; these patient advocacy tools can also help team members take action to escalate concerns (Clapper, 2018). CUS is another communication tool, recommended for use to assist in effective communication related to patient safety concerns. **CUS**, which stands for I'm **C**oncerned, I'm **U**ncomfortable, This is un**S**afe (This is a **S**afety issue), was developed from an airline safety program and provides mutually agreed-upon critical language for communication (Tocco, 2014). CUS offers a consistent method for health care team members to speak up about patient safety concerns in an assertive manner that is clear, structured, and easy to use (Agency for Healthcare Research and Quality, 2020). CUS can be used when the nurse feels there is an unsafe situation and needs to effectively communicate this concern to other health care providers.

S

SITUATION

I am calling about _____

The patient's Code status is: _____

The problem I am calling about is: _____

(e.g., I AM CONCERNED THE PATIENT IS GOING TO ARREST)

I have just assessed the patient personally:

Vital signs are: Blood pressure_____/_____, Pulse_____,
Respiration_____, and temperature_____

I am concerned about the:

Blood pressure because it is	over 200 or	less than 100 or	30 mm Hg below usual
Pulse because it is	over 130 or	less than 40 and symptomatic	
Respiration because it is	less than 8 or	over 30	
Temperature because it is	less than 96 or	over 104	
Urine output because it is	less than 25 mL/hr or 200 mL/8 hr		
0_2 saturation because it is	less than 88% on 6/L nasal cannula		

Other: _____

B

BACKGROUND

The patient's mental status is:

Alert and oriented to person, place, and time
Confused and cooperative or non-cooperative
Agitated or combative
Lethargic but conversant and able to swallow
Stuporous and not talking clearly and possibly not able to swallow
Comatose Eyes closed Not responding to stimulation.

The skin is:

Warm and dry
Pale
Mottled
Diaphoretic
Extremities are cold
Extremities are warm

The patient is not or is on oxygen.

The patient has been on _____ (L/min) or (5) oxygen for _____ minutes (hours)
The oximeter is reading _____ %
The oximeter does not detect a good pulse and is giving erratic readings.

A

ASSESSMENT

This is what I think the problem is: _____

"SAY WHAT YOU THINK IS THE PROBLEM"

The problem seems to be cardiac infection neurologic respiratory
I am not sure what the problem is but the patient is deteriorating.
The patient seems to be unstable and may get worse, we need to do something.

R

RECOMMENDATION

From Physician _____

Transfer the patient to Critical Care.
Come to see the patient at this time.
Talk to the patient or family about Code status.
Ask a consultant to see patient now.

Are any tests needed:

Do you need any tests like CXR ABG EKG CBC BMP
Others:_____

If a change in treatment is ordered then ask:

How often do you want vital signs?
How long do you expect this problem will last?
If the patient does not get better when would you want us to call again?

FIGURE 8-4. Sample SBAR Communication Tool. (*Source:* Reprinted with permission from the Institute for Healthcare Improvement. http://www.ihi.org/knowledge/Pages/Tools/SampleSBARCommunicationTool.aspx)

Additional information related to effective reporting and professional and interprofessional communication is discussed in Chapter 20.

USING PROFESSIONAL COMMUNICATION IN THE THERAPEUTIC RELATIONSHIP

Nurses and other health care personnel enter health care in order to help people. Relationships between health care providers and patients develop in part through use of purposeful communication. A caring, **therapeutic relationship** exists among people who provide and receive assistance in meeting human needs. It sets the climate for the participants

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

to move toward common goals. Therefore, the patient's needs are met as the result of a successful therapeutic relationship.

When a nurse and patient are involved in a caring, therapeutic relationship, known as the **nurse–patient relationship**, the nurse is the carer and the patient is the person being cared for, in the context of mutual respect and value. The relationship between the nurse and patient is focused on promoting or restoring the health and well-being of the patient; the quality of the relationship between these people is the most significant element in determining its effectiveness. "Of all the problems that can arise in nursing care, perhaps the most common is failure to establish rapport and a helping–trust relationship with the other person" (Watson, 1985, p. 24). Communication is the means used to establish rapport and trusting, therapeutic relationships. In this book, the terms therapeutic relationship and nurse–patient relationship are used interchangeably to refer to such relationships between nurses and patients (Fig. 8-5).

FIGURE 8-5. A therapeutic relationship between the nurse and patient sets the climate for participants to move toward common goals. (*Source: Photo by Monkey Business Images/Shutterstock*.)

Therapeutic Versus Social Relationships

The difference between a therapeutic relationship and a friendship is important. Therapeutic relationships contain many of the qualities of a social relationship—they have in common the components of care, concern, trust, and growth. They are also very different:

- The therapeutic relationship does not occur spontaneously, as do most social relationships. It occurs for a specific purpose with a specific person.
- The therapeutic relationship is characterized by an unequal sharing of information. The patient shares information related to personal health problems, whereas the nurse shares information in terms of a professional role. In a friendship, information sharing is more likely to be similar in quantity and type.
- The therapeutic relationship is built on the patient's needs, not on those of the nurse. In a friendship, needs of both participants are generally considered. A friendship might grow out of a therapeutic relationship, but this is separate from the purposeful, time-limited interaction described as a nurse–patient relationship.

It is important to remember that therapeutic relationships are professional relationships. It can be helpful to identify nurse models who, through their appearance, demeanor, and behavior, communicate a clear sense of professionalism or confidence and expertise in their practice. Patients and the public are more likely to trust and value nurses who appear competent and confident and who are focused on the patients entrusted to their care. Rudeness, sloppiness, inattention to person, sexually inappropriate behavior, and other breaches of professionalism undermine nursing's professional image and the effectiveness of individual nurses. Nursing and professionalism is discussed in detail in Chapter 1. Caring; therapeutic relationships; and thoughtful, person-centered care are also discussed in Chapter 13.

Think back to **Mr. Gordon**, the patient described in the Reflective Practice display, and consider the behavior of the nurse and residents caring for the patient. Unfortunately, their focus was not on the patient as a whole but, rather, on the patient's devices and technologic equipment. The nurse needs to keep in

mind the highly technical nature of the ICU and work to implement a plan of care that focuses on the "whole" patient.

Characteristics of the Therapeutic Nurse–Patient Relationship

The therapeutic (nurse–patient) relationship is intangible, and therefore difficult to describe. It is thought that it has at least the following basic characteristics:

- It is a caring, person-centered relationship.
- It is dynamic. Both the person providing the assistance and the person being helped are active participants to the extent each is able.
- It is purposeful and time limited. This means there are specific goals that are intended to be met within a certain period.
- Although both parties in the therapeutic relationship have responsibilities, the person providing the assistance is professionally accountable for the outcomes of the relationship and the means used to attain them. Nurses should present their helping abilities as honestly as possible and not promise to provide more assistance than they can offer.

Goals of the Therapeutic Relationship

The goals of a therapeutic relationship (nurse–patient relationship) are determined cooperatively and are defined in terms of the patient's needs. Broadly speaking, common goals might include increased independence for the patient, greater feelings of worth, and improved health and well-being. Selected nursing interventions will help the person move toward the goal. As the patient's needs and goals change, so do the nursing care interventions implemented to attain the patient's goals. You might also have many needs to be met, but in the therapeutic relationship between the nurse and the patient, those are temporarily set aside—the focus is on the patient's needs (Videbeck, 2020).

Phases of the Therapeutic Relationship

The therapeutic (nurse–patient) relationship is often described as having three phases: (1) the orientation phase, (2) the identification and exploration (or working) phase, and (3) the resolution (or termination) phase (Peplau, 1952; Registered Nurses' Association of Ontario [RNAO], n.d.). In clinical practice, the phases are not that clear-cut, with varying overlap and interlock (Videbeck, 2020). In the therapeutic relationship, the communication process follows the sequence of the nursing process. Both processes are continuous and reciprocal. Box 8-3 summarizes goals for patients during the phases of an effective therapeutic relationship.

Nurse–patient relationships vary in depth, length, and focus. In some situations, one nurse initiates the therapeutic relationship and works with the patient and family through to termination. More often (e.g., in acute care settings), different nurses at different times are implementing different phases of the relationship. In addition, a brief therapeutic encounter might last only a few minutes, focusing on the patient's immediate needs; a longer hospitalization might result in a relationship that lasts weeks (Keltner & Steele, 2019). The current environment of health care includes brief hospitalization and time-limited care (Keltner & Steele). In this context, Keltner and Steele suggest the phases of the therapeutic (nurse–patient) relationship are often not a sequence of processes, but different emphases or goals. The nurse concentrates on nursing approaches in a particular phase, depending on the status and needs of the individual patient (Keltner & Steele, p. 85).

Box 8-3 Summary of Patient Goals for the Three Phases of the Therapeutic Nurse–Patient Relationship

Orientation Phase

- The patient will call the nurse by name.
- The patient will accurately describe the roles of the participants in the relationship.
- The patient and nurse will establish an agreement about:
  - Goals of the relationship
  - Location, frequency, and length of the contacts
  - Duration of the relationship

Working Phase

- The patient will actively participate in the relationship.
- The patient will cooperate in activities that work toward achieving mutually acceptable goals.
- The patient will express feelings and concerns to the nurse.

Termination

- The patient will participate in identifying the goals accomplished or the progress made toward goals.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

- The patient will verbalize feelings about the termination of the relationship.

Source: Adapted from Townsend, M., & Morgan, K. I. (2018). *Psychiatric mental health nursing: Concepts of care in evidence-based practice* (9th ed.). F.A. Davis Company; Videbeck, S. L. (2020). *Psychiatric mental health nursing* (8th ed.). Wolters Kluwer.

In preparation for the orientation phase, nurses might use interpersonal communication to prepare for the data-gathering phase of the interaction with the patient.

Orientation Phase

The nurse–patient relationship ideally begins between the nurse and patient during the data-gathering part of the nursing process. It can also be initiated at other times during the nurse–patient relationship. In the orientation phase, the tone and guidelines for the relationship are established. The nurse and the patient meet and learn to identify each other by name. It is especially important to introduce yourself to the patient; it might even be helpful to write your name for the patient. Failure to do so might result in the patient becoming confused and mistrustful because of the number of caregivers with whom most patients come in contact.

The following activities generally occur during the orientation phase of the therapeutic relationship:

- The roles of both people in the relationship are clarified.
- An agreement or contract about the relationship is established. The agreement is usually a simple verbal exchange related to goals and the means of achieving them or occasionally a written document, especially if the relationship extends over a long period of time.
- The patient is provided with an orientation to the health care facility, its services, admission routines, and any pertinent information the patient requires to decrease anxiety. This orientation should be identified as one of the goals in the nurse–patient relationship.

The development of a trusting relationship is critical to the development of the nurse–patient relationship. Exhibiting openness and interest in the concerns of the patient paves the way for developing trust and communicating care and respect.

Working Phase

The working phase is usually the longest phase of the nurse–patient relationship. During this phase, the nurse works together with the patient to meet the patient's physical and psychosocial needs. Interaction is the essence of the working phase. Nurse–patient interactions that occur at this time are purposeful in that they are designed to ensure achievement of health goals or objectives that were mutually agreed upon.

In addition, the nurse as caregiver provides the patient with whatever assistance might be needed to perform activities of daily living. For example, if a patient with impaired mobility is unable to get out of bed except to use a bedside commode, the nurse or caregiver needs to help with daily hygiene.

The nursing roles of teacher and counselor (see Chapter 9) are performed primarily during this phase. These roles involve motivating the patient to learn and to implement health-promotion activities, to facilitate the patient's ability to execute the plan of care, and to express feelings about health problems, nursing care, any progress or setbacks, and any other areas of concern. This is where your interpersonal skills are used to their fullest. A breakdown of the nurse–patient relationship on one of these levels could result in serious consequences. Satisfactory interaction preserves people's integrity while promoting an atmosphere characterized by minimal fear, anxiety, distrust, and tension. People feel harmonious and contented with each other as they work cooperatively to reach common goals.

Termination Phase

The termination phase occurs when the conclusion of the initial agreement is acknowledged. This might happen at change-of-shift time, when the patient is discharged, or when a nurse takes vacation or employment elsewhere. At this point, you'll examine with the patient the goals of the therapeutic relationship for indications of their attainment or for evidence of progress toward them. If the goals/outcomes have been reached, this fact should be acknowledged. Such acknowledgment generally results in a feeling of satisfaction for the patient and nurse. If the goals/outcomes have not been reached, the progress can be acknowledged and either the patient or you might make suggestions for future efforts.

Ordinarily, emotions are associated with the termination of a nurse–patient relationship. If the goals have been met, there is often regret about ending a satisfying relationship, even though a sense of accomplishment persists. If the goals have not been achieved, the patient might experience anxiety and fear about the future. Whatever the feelings, patients should be encouraged to express their emotions about the termination.

You can prepare for the termination of the nurse–patient relationship in various ways. It is thoughtful to set the stage for the patient to establish a therapeutic relationship with another nurse, if appropriate. You can also assist the patient transferring from one facility to another or from one unit in a facility to another by offering explanations concerning the transfer. In some instances, you might introduce the patient to personnel who will be giving care.

Interpersonal relations are discussed in greater detail in the classic works of nursing theorists Orlando (1961), Paterson and Zderad (1976), Peplau (1952), Travelbee (1971), and Watson (1985).

Factors Promoting Effective Communication Within the Therapeutic Relationship

Despite the fact that patient stays in health care facilities are shorter than in the past and there is now an increased reliance on technology, skilled professional communication with patients and their families is essential and remains a vital part of the therapeutic (nurse–patient) relationship. Nurses who are competent, honest, skilled communicators are viewed as effective and compassionate caregivers. This focus on therapeutic relationships is a critical component of what nurses do and plays a vital role in promoting healing, enhancing safety, and improving clinical outcomes.

Dispositional Traits

A dispositional trait is a characteristic or customary way of behaving. Nurses who consistently demonstrate warmth and friendliness; openness and rapport; empathy, honesty, authenticity, and trust; caring; and competence are well disposed to communicate effectively.

WARMTH AND FRIENDLINESS

Initiation of a therapeutic (nurse–patient) relationship depends on the nurse's ability to begin the orientation phase successfully. A pleasant greeting and friendly smile can facilitate this phase and place the patient at ease. By maintaining qualities of warmth and friendliness throughout the nurse–patient relationship, you will convey continuous acceptance of the patient and interest in discussing the patient's feelings and concern.

OPENNESS AND RESPECT

One key factor to effective communication is to be open, accepting, frank, respectful, and without prejudice. Patients who feel that a nurse is being judgmental might withhold significant information. You need to develop sensitivity to the unique challenges presented by each patient. Attention to patient variables that might influence the process of communicating (e.g., biologic sex, expressed gender role identification, developmental level, culture, life experience) can make the difference between effective and ineffective interactions. For example, respectful communication includes acknowledging and respecting a person's identity through use of the terms the individual uses to describe themselves (GLAAD, 2016). If necessary, respectfully and privately ask what terms they use to describe themselves (e.g., pronouns "he" and "she," or gender-neutral pronouns, such as "they"), then use those terms (GLAAD, 2016). Box 8-4 provides another example of respectful ways to relate to patients, in this case, patients from different cultures (see also Chapter 5).

Box 8-4 Relating to Patients from Different Cultures

Assess your personal beliefs surrounding people from different cultures

- Review your personal beliefs and past experiences.
- Set aside any values, biases, ideas, and attitudes that are judgmental and may negatively affect care.

Assess communication variables from a cultural perspective

- Determine the ethnic identity of the patient, including generation in the United States.
- Use the patient as a source of information when possible.
- Assess cultural factors that may affect your relationship with the patient and respond appropriately.

Plan care based on the communicated needs and cultural background

- Learn as much as possible about the patient's cultural customs and beliefs.
- Encourage the patient to reveal cultural interpretation of health, illness, and health care.
- Be sensitive to the uniqueness of the patient.
- Identify sources of discrepancy between the patient's and your own concepts of health and illness.
- Communicate at the patient's personal level of functioning.
- Evaluate effectiveness of nursing actions and modify plan of care when necessary.

Modify communication approaches to meet cultural needs

- Be attentive to signs of fear, anxiety, and confusion in the patient.
- Respond in a reassuring manner in keeping with the patient's cultural orientation.
- Be aware that in some cultural groups, discussion concerning the patient with others may be offensive and may impede the nursing process.

Understand that respect for the patient and communicated needs is central to the therapeutic relationship

- Communicate respect by using a kind and attentive approach.
- Learn how listening is communicated in the patient's culture.
- Use appropriate active listening techniques.
- Adopt an attitude of flexibility, respect, and interest to help bridge barriers imposed by culture.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Communicate in a nonthreatening manner

- Conduct the interview in an unhurried manner.
- Follow acceptable social and cultural amenities.
- Ask general questions during the information-gathering stage.
- Be patient with a respondent who gives information that may seem unrelated to the patient's health problem.
- Develop a trusting relationship by listening carefully, allowing time, and giving the patient your full attention.

Use validating techniques in communication

- Be alert for feedback that the patient does not understand.
- Do not assume meaning is interpreted without distortion.

Be considerate of reluctance to talk when the subject involves sexual matters

- Be aware that in some cultures, sexual matters are not discussed freely with members of the opposite sex.

Adopt special approaches when the patient speaks a different language

- Use a caring tone of voice and facial expression to help alleviate the patient's fears.
- Speak slowly and distinctly, but not loudly.
- Use gestures, pictures, and play acting to help the patient understand.
- Repeat the message in different ways if necessary.
- Be alert to words the patient seems to understand and use them frequently.
- Keep messages simple and repeat them frequently.
- Avoid using medical terms and abbreviations that the patient may not understand.
- Use an appropriate language dictionary.

Use interpreters to improve communication

- Ask the interpreter to translate the message, not just the individual words.
- Obtain feedback to confirm understanding.
- Use an interpreter who is culturally sensitive.

EMPATHY

Empathy is an objective understanding of the way in which a patient sees their situation, identifying with the way another person feels, putting yourself in another person's circumstances, imagining what it would be like to share that person's feelings and communicating this understanding to the patient (Keltner & Steele, 2019; Videbeck, 2020). In contrast, sympathy is the expression of sorrow for someone's situation, involving compassion and kindness. Sympathy shifts the emphasis from the patient to the nurse as the nurse shares feelings and personal concerns and projects them onto the patient. Employing sympathy rather than empathy limits the nurse's ability to focus objectively on the patient's needs (Videbeck, 2020).

Empathy is one of the approaches that nurses use to communicate emotional support in their relationships with patients (Keltner & Stele, 2019). An empathic nurse is sensitive to the patient's feelings and problems but remains objective enough to help the patient work to attain positive outcomes. You can establish successful therapeutic relationships without appearing cold or stern by retaining the quality of empathy. For example, although it is understandable for team members to become impatient with family members who never seem satisfied with the care their loved one is receiving, it helps to empathize with the family, who may be feeling frightened and helpless. Appropriate responses employing empathy may include:

"This must be a hard time for you; how are you coping?"
"Is there any way I can be of help?"

When the patient and family sense that you have some idea of what they are experiencing, and that you are committed to helping, the basis is set for a trusting nurse–patient relationship.

HONESTY, AUTHENTICITY, AND TRUST

Patients should be able to trust that nurses are who they say they are (professional care givers). Patients should also be able to believe that nurses can be trusted to do everything within their level of expertise to secure the resources and to help meet the patient needs.

CARING

Patients quickly sense whether they are merely a "task to be performed" (task-centered caring), or a person of worth who is both cared about and cared for (relation-centered caring). Expert nurses know how to communicate genuine caring the minute they step into a patient's space by how they look at and touch the patient and what they say and do. Patients who feel cared for will feel accepted.

Think back to **Susie Musashi**, the 3-year-old child with burns. How the nurse approaches the child will set the stage for the interaction. Consider how the child would respond to a nurse who enters the room and scolds the child for crying as compared to the nurse who enters the room and approaches the child's bed, touching the child's shoulder or hand gently and softly. The message conveyed by the second action would be much more caring.

COMPETENCE

Competent nurses are skilled in all aspects of basic nursing and can meet their patients' health care needs through their technical, cognitive, interpersonal, and ethical/legal skills. Take responsibility for evaluating your own strengths and weaknesses so that your patients will receive optimal care. Consequently, your patients will develop trust in and respect for you as their nurse, facilitating therapeutic relationships and good communication.

Rapport Builders

Rapport, a feeling of mutual trust experienced by people in a satisfactory relationship (Fig. 8-6), facilitates open communication. Good rapport can be achieved by paying attention to the following variables.

FIGURE 8-6. Rapport between the nurse and the patient or family is a necessary first step in planning care.

SPECIFIC OBJECTIVES

Having a purpose for an interaction provides guidance toward achieving a meaningful encounter with the patient. One objective might be to perform a head-to-toe physical assessment when greeting the patient and at the beginning of each shift. Another objective might be the discussion of a patient's feelings about being newly diagnosed with diabetes. The shortest encounter with a patient can have an objective, even if it is as simple as conveying a feeling of friendliness. Be flexible at all times, and follow the patient's cues to work toward meeting all needs.

COMFORTABLE ENVIRONMENT

A comfortable environment, in which both the patient and the nurse are at ease, helps to promote interactions. Suitable furniture, proper lighting, and a moderate temperature are important. Also, effective relationships are enhanced when the atmosphere is relaxed and unhurried. If you seem preoccupied and on the run, or if the patient is ill at ease for fear of missing visitors or because of another commitment, communication is impaired.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

PRIVACY

It might not always be possible to carry on conversations alone with the patient in a room, but every effort should be made to provide privacy and to prevent conversations from being overheard by others. Sometimes merely drawing the curtains around the bed in a hospital or long-term care facility or sitting in a corner of the waiting room or lounge can provide the sense of privacy that is so important in most interactions. Home visits might need to be timed to ensure the privacy the patient desires and needs.

CONFIDENTIALITY

The confidentiality with which patient information is to be treated should be established with the patient. Indicate with whom the information that the patient gives will be shared. The patient should know about the right to specify who might have access to the information. Failure to consider this factor can be considered a breach of the patient's right to privacy. See Chapter 20 for guidelines concerning patient confidentiality.

Through the Eyes of a Patient

I know you come to clinical every day with your head full of all the important things you need to do for me. Probably you worry about whether you will remember the steps to both simple and complex procedures and fear that you will never get everything done in the time allotted. I'm sure that there are many things that your clinical instructor will use as a basis for your evaluation, and perhaps other things that are important to you for your self-evaluation. But I thought you might like to know what's important to me. Most of what I've listed are simple things that you can communicate each time you walk into my home or room.[a]

- Really listen to me.
- Ask me what I think.
- Don't dismiss my concerns.
- Don't treat me like a disease, treat me like a person.
- Talk *to* me, not *at* me.
- Respect my privacy.
- Don't keep me waiting.
- Don't tell me what to do without telling me how to do it.
- Keep me informed.
- Remember who I used to be.
- Let me know you care.

Thanks for giving me this chance to share with you what matters to me.

———————

[a]The list of nursing interventions that are valued highly by patients was compiled by Roberta Messner after a review of many patient satisfaction studies. These are cited in Messner, R. L. (1993). What patients really want from their nurses. *American Journal of Nursing*, *93*(8), 38–41.

PATIENT VERSUS TASK FOCUS

Communication in the nurse–patient relationship should focus on the patient and patient needs, not on the nurse or an activity in which the nurse is engaged. Refer to the accompanying box, Through the Eyes of a Patient. Consider the following example, in which the nurse's comment focuses on the patient and the patient needs:

Patient: I don't know why these injections scare me, but they do.
Nurse: You are afraid of these injections?

In contrast, consider this example, in which the nurse's comment focuses instead on the nursing activity:

Patient: I don't know why these injections scare me, but they do.
Nurse: I give hundreds of injections. Don't be so immature.

USING NURSING OBSERVATIONS

Observations, which involve both effective noticing and interpreting, are especially useful for validating information. For example, a nurse suspects that a patient is afraid to hear the results of certain blood tests, but the patient insists that the results are unimportant. The nurse then observes the patient pacing in the corridor, apparently deep in thought. Observing the patient's behavior helps validate the nurse's suspicion that the patient is fearful and the patient's assertion of being unconcerned appears to be a cover-up for truer feelings.

Observation serves several important purposes:

- It helps increase the awareness of a patient's nonverbal messages.
- It is the primary source of information when a patient is unwilling or unable to communicate verbally.

- It demonstrates caring and interest in the patient. (Patients often recognize when a nurse is unobservant and, rightly or wrongly, commonly conclude that the nurse does not care about them.)
- It is an important component of clinical reasoning and clinical judgment (see Chapters 13 and 19).

OPTIMAL PACING

Consider the pace of any conversation or encounter with a patient. For instance, it would be ineffective to rush through a list of questions when obtaining a nursing history; it is more effective to let the patient set the pace. Let the patient know at the beginning of the interaction if time is limited so that the patient does not feel that you are rushing because of a lack of concern or personal interest.

DEVELOPING PROFESSIONAL THERAPEUTIC COMMUNICATION SKILLS

Although humans communicate during virtually all waking moments, the therapeutic use of communication requires training and practice. Box 8-5 contrasts therapeutic and nontherapeutic communication. Nursing students might feel awkward when first trying to develop therapeutic relationships. Practice makes perfect, however, and you will soon feel at ease if you work on developing the following communication skills.

Conversation Skills

Conversation, or the exchange of verbal communication, is a social interaction. As social beings, humans learn as children how to converse with others; nursing students, therefore, have already had years of experience communicating verbally. However, you can improve your communications with patients and achieve a more effective relationship in the following ways:

- Control the tone of your voice so that you are conveying exactly what you mean to say and not a hidden message. Your tone should indicate interest rather than boredom, patience rather than anger, acceptance rather than hostility, and so forth.
- Be knowledgeable about the topic of conversation and have accurate information. When possible, be familiar with the subject of conversation before discussing it with the patient. If the topic is unfamiliar to you (e.g., the availability of community resources for family caregivers of patients with special needs), admit that to the patient and family and direct them to other resources. Convey confidence and honesty to the patient.

Box 8-5 Therapeutic versus Nontherapeutic Communication

Patient Scenario

Mr. Commens is a 65-year-old divorced man who lives alone. His grown children are married and live out of town. He was recently diagnosed with cancer of the colon and underwent a colon resection. He is now home recuperating and has received a new diagnosis. The home health care nurse is scheduled to visit Mr. Commens.

Nontherapeutic Communication

Nurse: Hello, Mr. Commens! I'm glad you're home. I only have 30 minutes to visit with you. It's been a very busy day.

Mr. Commens: I'm sorry you are having a bad day. I have been to the doctor and I'm very concerned about the report I received.

Nurse: Yes, I've had a busy day but not a bad day. I guess your day has been busy too. What report are you talking about?

Mr. Commens: Well, I need more tests because they think the cancer has spread.

Nurse: Now, who told you that? Maybe the test was wrong, or you misunderstood the health care provider. Mr. Commens, I'll call your health care provider. Is there anything else bothering you?

Mr. Commens: No.

Nurse: I'll call your doctor and then call you tomorrow.

In this scenario, the nurse seems unconcerned about Mr. Commens' test results and gives him the idea the nurse does not believe the information he has relayed. The nurse is more concerned about their own busy day and less concerned about the patient.

Therapeutic Communication

Nurse: Hello, Mr. Commens! I'm sorry I am running a little behind schedule. Now that I'm here, we will have as much time as we need to discuss how you're feeling and your visit to the health care provider. How are you feeling?

Mr. Commens: (His eyes are cast down to the floor and he is wringing his hands.) Well, I feel all right. I've

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

had some pain in my right side.

Nurse: Mr. Commens, how would you describe and rate your pain on a scale of 1 to 10?

Mr. Commens: Aching and about an 8.

Nurse: Mr. Commens, you seem concerned and a little preoccupied. Is there something bothering you?

Mr. Commens: Yes, I suppose there is. My doctor said my cancer has spread to my hip. I guess that's why I have pain in my right side. I have so many decisions to make and I'm very confused. The doctor said I need to start chemotherapy. I don't even know how I'll get there. My family is out of town.

Nurse: Mr. Commens, would it help if I spoke to your health care provider to obtain specific details about your treatment plan? This would then assist me in obtaining some help when you begin your chemotherapy.

Mr. Commens: That would be wonderful! If you call the doctor, then you can explain everything to me, and maybe it will help me to understand what I'll be going through. Also, it might help me in making decisions about my treatments.

Nurse: Mr. Commens, would you then like me to be here when you call your children about your diagnosis and treatment plan? I might be able to answer some of the questions they might have about your treatments.

Mr. Commens: That would be wonderful. I feel so much more relaxed knowing you are going to help me. Thank you so much.

Nurse: Mr. Commens, I'll call your health care provider and clarify the information you have received, and I'll be back at 5 PM. Maybe at that time, we can call your family.

Mr. Commens: That sounds like a good plan, but we might need to call my children at 6 PM.

Nurse: That's just fine. I will be back at 5 PM to discuss the information I have, and we will call your children at 6 PM.

Interpretation

The first example of communication focuses on the nurse's needs, not the patient's needs. Most of the interaction in the first scenario blocks the communication process. The second example allows the patient to verbalize his concerns and his lack of decision making. The nurse provides the patient with broad opening statements and patient goals to assist in his planning and decision making.

- Be flexible. You might want to discuss a certain subject but learn that the patient wishes to discuss something else. It is better to follow the patient's lead whenever possible; in due time, you can return to the subject. For example, you arrive at the patient's bedside to administer a medication, but the patient begins to talk about diet issues. It is better to take a little time to talk about the patient's interest than to insist on talking about only the procedure at hand, as long as there is enough time for the conversation.
- Be clear and concise, and make statements as simple as possible. Patients are often anxious and fail to understand the message unless the patient understands the language used. Stay on one subject at a time. This helps prevent confusion.
- Avoid words that might have different interpretations. The study of the meaning of words is called **semantics**. Even when two people speak the same language, some words—such as love, hate, freedom, and health—might have different meanings to different people.
- Be truthful. A patient who is given false information will soon distrust the nurse. If you're not sure about something, admit you don't know and seek an answer rather than make a comment that may be an error.
- Keep an open mind. An attitude of "I know better than the patient" is quickly discerned by the patient. Patients can make valuable contributions to their own health care.
- Take advantage of available opportunities. During most caregiving situations, you can facilitate conversation that makes even the most routine task meaningful. For instance, when giving a bed bath to a patient, ask about the patient's employment. This would allow the patient to verbalize any positive or negative feelings about the job and being temporarily absent from it, reducing the anxiety that often occurs with the loss of work. It is often comforting to know that someone understands and cares.

FIGURE 8-7. Listening attentively, with concentration and genuine concern, is key to productive communication.

Listening Skills

Listening is a skill that involves both hearing and interpreting what the other says. It requires attention and concentration to sort out, evaluate, and validate clues to better understand the true meaning of what is being said (Fig. 8-7). The accompanying box, Through the Eyes of a Student, relates one student's experience with attentive listening. The following techniques are recommended to improve listening skills:

- When possible, sit when communicating with a patient (George et al., 2018; Videbeck, 2020). Do not cross your arms or legs because that body language conveys a message of being closed to the patient's comments (Videbeck, 2020).
- Be alert and relaxed and take sufficient time so that the patient feels at ease during the conversation.
- Keep the conversation as natural as possible, and avoid sounding overly eager.
- If culturally appropriate, maintain eye contact with the patient, without staring, in a face-to-face pose. This technique conveys interest in the conversation and willingness to listen.
- Indicate that you are paying attention to what the patient is saying by using appropriate facial expressions and body gestures. Be attentive to both your own and the patient's verbal and nonverbal communication.
- Think before responding to the patient. Responding impulsively tends to disrupt communication and listening.
- Do not pretend to listen. Most patients are sensitive to an attitude of feigned attention or to boredom and apathy.
- Listen for themes in the patient's comments. What are the repeated themes in the person's speech and behavior? What topics does the patient tend to avoid? What subjects tend to make the patient shift the conversation to other subjects? What inconsistencies and gaps appear in the patient's conversations?

Silence

You can use silence appropriately, allowing the patient to gather their thoughts and to proceed at their own pace to initiate a conversation or to continue speaking (Videbeck, 2020). During periods of silence, you can reflect on what has already been shared and observe the patient without having to concentrate simultaneously on the spoken word. Periods of silence during communication can carry a variety of meanings:

Through the Eyes of a Student

It was my first day of clinical rotation and I was assigned to Mr. Anderson, who was in his early 90s. He was in the hospital because he had a second heart attack. Mr. Anderson had lived alone for 5 years after the death of his wife. He wanted to remain independent, but his daughter, who was herself in her late 60s, and his doctor believed that he would not be able to function well on his own any longer. Mr. Anderson was distressed about this belief.

Because it was my first day and, unlike some of my classmates, I had never worked in a hospital before, I felt insecure and nervous. There really wasn't a lot of work for us to do. We weren't allowed to give medication yet, and my patient was pretty self-sufficient. Because my skills were shaky, I took my time taking vital signs, assisted Mr. Anderson with his bath and toileting, and made his bed. After checking his chart, I began my nursing interview with him. I was overjoyed to discover that he was a real talker! His memory was tremendous—either that or he was a great improviser! He recalled stories about his childhood and his wife with great detail and emotion. He smiled and laughed when he spoke of his daughter and grandchildren. He told me about his daughter's childhood illnesses, as well as his own. We talked about the Depression and world wars and about music, art, and education. He asked me about my family, and I felt like I had made a friend.

The next day, Mr. Anderson told me about his fears. He talked about losing his wife, about his health and body deteriorating, and about losing his independence and home. He despised having to be sent to a long-term care facility and having to depend on others. It hurt him a lot and made me sad. Mr. Anderson left on my second day, and as I said goodbye, I wished I could do something for him.

I've thought about him a lot since then, and I've come to realize that in those 2 days that I knew Mr. Anderson, I

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

did do something for him besides washing him and changing his sheets. I listened to him. Although his family had little time for him and the doctors quickly flew in and out of the room, I let him talk and heard all he said, both in words and in his eyes. He will always be a good memory for me—and I think I'll be a good memory for him.

—Kristina Hofmeister
Holy Family College, Philadelphia, PA

- The patient might be comfortable and content in the nurse–patient relationship. Continuous talking is unnecessary.
- The patient might be trying to demonstrate stoicism and the ability to cope without help.
- The patient might be exploring inner thoughts or feelings, and a conversation would disrupt this. In effect, the patient is really saying, "I need some time to think."
- The patient might be fearful and use silence as an escape from a threat.
- The patient might be angry and use silence to display this emotion.
- The patient's culture may require longer pauses between verbal communication.

In time, you might discuss the silence with the patient, especially if you wish to understand its meaning. Fear of silence sometimes leads to too much talking by the nurse. Also, excessive talking tends to place the focus on the nurse rather than on the patient.

Touch

Touch is a powerful means of communication with multiple meanings. It can connect people; provide affirmation, reassurance, and stimulation; decrease loneliness; increase self-esteem; and share warmth, intimacy, approval, and emotional support. It can also communicate frustration, anger, aggression, and punishment, and invade personal space and privacy.

Touch is the most highly developed sense at birth. Tactile experiences of infants and young children appear to be essential for the normal development of self and awareness of others. It has also been found that many older people long for touch, especially when isolated from loved ones because of hospitalization or being in a long-term care facility. Many older people have no living family to provide them with the caring touch so necessary for the sense of well-being. In such an instance, you can provide some special care by holding the patient's hand (Fig. 8-8).

FIGURE 8-8. A reassuring handclasp uses touch to convey a message. Sometimes touch can be a more effective way of expressing concern and interest than verbal communication. (*Source:* Used with permission from Shutterstock. *Photo by B. Proud*.)

Many situations require touching the patient while implementing nursing care. Physical closeness between the patient and the nurse is essential and inevitable. Therefore, every nurse needs to become comfortable with the judicious use of this nonverbal communication technique so that a sense of security, rather than anxiety, results. As well, dexterity and sureness in the use of the hands help to assure the patient of your expertise when measuring blood pressure or giving an injection. Touch can be a powerful therapeutic tool when used at the right time. Anxiety or discomfort might result, however, when a patient does not understand the meaning of a tactile gesture or when the patient simply dislikes being touched. Because of the personal nature of touching, be sure to weigh the benefit of touch against the detrimental use of touch for each patient. The nurse should observe the patient for cues that show whether touch is desired or indicated, and ask the patient about touching prior to implementation (Videbeck, 2020).

Interest has continued to grow in the phenomenon known as therapeutic touch. A nurse trained in therapeutic touch may use it to promote comfort, relaxation, healing, and a sense of well-being. Many nurses are studying therapeutic touch in nursing educational programs and through special courses or workshops. It is becoming a widely accepted form of therapy, as well as a subject for nursing research. Refer to Chapters 29 and 36 for additional discussion of therapeutic touch.

Humor

Humor is increasingly valued as both an interpersonal skill for the nurse and a healing strategy for patients. Nurses can use humor effectively to maintain a balanced perspective in their work and to encourage patients to do the same. Nurses with a sense of humor are able to laugh at themselves and accept their failures, confront the absurdities of everyday practice without falling apart, and challenge patients to situate their current dilemma within the context of their larger life experiences. Laughter releases excess physical and psychological energy and reduces stress, anxiety, worry, and frustration. Humor, like other interpersonal competencies, is a learned skill. When used inappropriately, however, it can be destructive. You'll need an awareness of how various cultures perceive the use of humor in the presence of an illness. You might also find it helpful to identify nurses who use humor well and to "try on" observed behaviors. The use of humor is also discussed in Chapter 36.

Interviewing Techniques

The purpose of the patient interview is to obtain accurate and thorough information. In nursing, the interview is a major tool for collecting data during the assessment step of the nursing process and is an important component of clinical reasoning and clinical judgment (see Chapters 13, 14, and 15). Consequently, every nurse needs to become proficient in the use of the communication techniques described previously as well as interviewing techniques designed to gather and validate information.

All interviews should begin with an explanation of the purpose of the interview. During the interview, you'll use interviewing techniques to obtain needed information while remaining flexible in approach. The interview itself is a therapeutic interaction and might be an essential part of the orientation phase of the therapeutic relationship. At the end of the interview, plans for further interactions can be made. The following interviewing techniques are useful in nearly all nurse–patient interactions, especially the interview.

Open-Ended Question or Comment

When collecting patient information, such as during a nursing history, use the open-ended question technique to allow the patient a wide range of possible responses. Use of open-ended questions allows patients to express what they understand to be true, yet is specific enough to prevent digressing from the issue at hand. It encourages free verbalization and more descriptive information (Videbeck, 2020). The greatest advantage of this technique is that it prevents the patient from giving a simple yes or no answer that has the effect of limiting the patient's response. The following is an example of an open-ended question and the response:

Nurse: What did your health care provider tell you about your need for this hospitalization?
Patient: He told me that my blood pressure is dangerously high and that I need some special tests done while I am here.

Closed Question or Comment

The closed (focused) question or comment provides the receiver with limited choices of possible responses and might often be answered by one or two words, "yes" or "no." Closed questions are used to gather specific information from a patient and to allow the nurse and patient to focus on a particular area. Closed questions are often a barrier to effective communication. The following is an example of an appropriate use of a closed question:

Nurse: What medicines have you been taking at home?
Patient: Let me see, my doctor gave me a water pill and a blood pressure pill to take every day.

Validating Question or Comment

This type of question or comment serves to validate what the nurse believes they have heard or observed. Overusing validating questions and comments might lead the patient to think the nurse is not listening, however. To continue the example used in the previous technique, the nurse could validate the patient's reply as follows:

Nurse: At home, you have been taking both a water pill and a blood pressure pill every day. Did you take them today?
Patient: Yes, I took one of each with my breakfast.

Clarifying Question or Comment

At times, a patient's thoughts and/or communication may be unclear. The nurse should never assume understanding of the patient's meaning; the nurse should ask for clarification if there is doubt (Videbeck, 2020). The use of the clarifying question or comment allows the nurse to gain an understanding of a patient's comment. When used properly, this technique can prevent possible misconceptions that could lead to identification of an inappropriate diagnosis or patient problem. However, overuse of clarifying questions or comments can lead the patient to believe that the nurse is not listening or lacks appropriate knowledge. The following is an example of effective use of this technique:

Patient: I have never needed to take medicine before in my life.
Nurse: Is this the first health problem you have had?

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Patient: Yes, I've always been healthy.

Reflective Question or Comment

The reflective question technique involves repeating what the person has said or describing the person's feelings. It encourages patients to elaborate on their thoughts and feelings. An example of this technique follows:

Patient: I've been really upset about my blood pressure and have to take these pills.
Nurse: You've been upset …
Patient: I guess I'm worried about what could happen if my blood pressure gets too bad.

Sequencing Question or Comment

Sequencing is used to place events in a chronologic order or to investigate a possible cause-and-effect relationship between events. Nursing assessment is facilitated when events leading to a problem are placed in sequence. This technique is evident in the following example:

Patient: I don't feel like myself anymore since I've been taking my blood pressure medicine. I'm tired and don't have any energy.
Nurse: Your tiredness began after you started taking your medicine?

Directing Question or Comment

It might become necessary at times to obtain more information about a topic brought up earlier in the interview or to introduce a new aspect of the current topic. In this way, the nurse can gain additional valuable information to consider in assessing the patient's health status and educational or counseling needs. The following is an example of this technique:

Nurse: You mentioned your dad earlier. Did he develop complications related to high blood pressure?
Patient: Yes.
Nurse: What sort of complications?
Patient: Kidney failure. He was on dialysis for years before getting a transplant.
Nurse: Are you afraid this might happen to you?

Assertive versus Aggressive Behaviors and Communication

When interacting with patients, family members, other nurses, health care providers, and other members of the health care team, nurses should communicate in a way that demonstrates respect for all parties. **Assertive behavior** is the ability to stand up for yourself and others using open, honest, and direct communication. The focus is on the issue and not the person. Assertive behaviors, which are one hallmark of professional nursing relationships, are very different from aggressive (i.e., harsh, injurious, or destructive) behaviors. They also differ greatly from avoidance or acquiescent behaviors. Assertiveness involves making a choice about how to behave in order to gain a desired outcome, not just about being firm in order to get what is wanted (Ellis, 2018). The key to assertiveness is expressing feelings and beliefs in a nondefensive manner. "I" statements—"I feel…" and "I think…"—play an important role in assertive statements (Videbeck, 2020). The use of assertive behaviors and communication respectfully expresses views, opinions, and concerns regarding patient care without judgment, belittlement, or blaming another person and without aggression (Ellis, 2018). Table 8-2 provides examples of assertive, nonassertive, and aggressive speech.

Table 8-2 Examples of Assertive, Nonassertive, and Aggressive Speech

	ASSERTIVE	NONASSERTIVE	AGGRESSIVE
Nurse to Nurse	"I know we all lose track of time occasionally, but I'm finding it harder and harder to cover for you when you take extra time for lunch. I don't think it's fair for your patient and me to have to wait an extra 30 minutes every day for you to come back from lunch. Can we talk about this?"	"Huh? No, I didn't really mind. Luckily I wasn't too busy today." Thought: "What a sucker I am. Now I'll have to grab a quick bite so that I can get back to the unit in time to do the 1,400 treatments."	"I'm sick and tired of covering for you. You are lazy and unreliable and I'm going to talk to the unit leader about you and let her know how irresponsible you are! What kind of nurse are you! I hope you lose your job!"
Nurse to Health Care Provider	"I know we talked about Mr. Esposito's pain	"Um … yes I know you already changed the	"What is it going to take to convince you that

	medication before, but I've collected some new data. Even with the change in dosage, he is only getting 1–1½ hours of relief. I believe a different analgesic agent may work better for him."	dosage. It's just that I thought it still wasn't working. Maybe I didn't give it enough time. Thanks for listening to me anyway. I'm sorry to bother you with this."	Mr. Esposito is not exaggerating his pain level so he can get more meds? I thought nurses and doctors were going to be more respectful of each other and collaborate, but this whole attempt to talk to you is a disaster. I need to report you to someone and maybe none of us will have to deal with you anymore. You give doctors a bad name."
Student Nurse to Preceptor	"Miss Cheng has a new order to be straight catheterized. I reviewed the procedure, but I'd sure appreciate your talking me through this because I've never done it before and I'm terrified."	"Uh…I'm sorry to be such a pain again. I have to do this catheterization and don't know where to begin. I know you must be busy, but, uh, is there any way you might have time for me?"	"If this is an example of how helpful experienced nurses on this unit are to student nurses, then the profession is in a lot of trouble. Are you one of the believers in that saying that 'nurses eat their young'? Remind me to try and avoid you in the future."

Characteristics of the assertive nurse's self-presentation include a confident, open body posture; eye contact; use of clear, concise "I" statements; and the ability to effectively share their thoughts, feelings, and emotions. The assertive nurse's attitude toward work is characterized by working to capacity with or without supervision, the ability to remain calm under supervision, the freedom to ask for help when necessary, the ability to give and accept compliments, and honesty in admitting mistakes and taking responsibility for them. Refer also to the previous discussion of the "CUS" communication technique—another example of a method for health care team members to assertively speak up about patient safety concerns, located on pages 185–187.

Aggressive behavior, on the other hand, involves asserting one's rights in a negative manner that violates the rights of others. Aggression can be verbal or physical. It is communication that is marked by tension and anger and inhibits the formation of good relationships and collaboration. Characteristics of aggressive verbal behavior include using an angry tone of voice and being condescending, and threatening (Marquis & Huston, 2021). Aggressive behavior is rude and intimidating. The focus is usually on "winning at all costs" or demonstrating personal excellence (Marquis & Huston, 2021). Comments such as "do it my way" or "that's just enough out of you" are examples of aggressive verbal statements. People speaking in an aggressive manner may invade another's personal space, speak loudly, and use gestures that are very emphatic or threatening. Aggressive people enhance their self-esteem and prove their superiority through destructive comments directed at others.

BARRIERS TO COMMUNICATION

Nurses who have a good understanding of their own feelings and responses are better able to communicate and respond to others. The failure to verbalize clearly and compassionately, however, blocks effective communication. Recognition of the patient as a human being, listening carefully, and avoiding nontherapeutic statements help the nurse to provide optimal, compassionate patient care. Respectful behavior and communication between nurses and other members of the health care team promotes a safer patient environment with positive outcomes and improved job satisfaction.

Failure to Perceive the Patient as a Human Being

Nurses must focus on the whole patient and not merely the patient's diagnosis. Patients report that nothing is more discomforting than to be treated as merely an object of care rather than a patient. Patients should be addressed in the manner of their preference; ask a patient how they prefer to be addressed or what they prefer to be called. Err on the side of formality over informality (Mr., Mrs., Ms., Mx.); use neutral and inclusive language when speaking with all patients (The Joint Commission, 2011). Do not use slang terminology such as "honey" or "sweetie." What distinguishes nursing

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

from other health professions is its focus on the whole person, not simply the illness or dysfunction.

Think back to **Mr. Gordon**, the patient with end-stage liver disease. In the scenario, the nursing student voiced concerns about the staff nurse and residents focusing only on the technical aspects of the patient's care. To effectively communicate this concern to these people, the student should use open, honest, and direct (assertive) communication when speaking with them, stressing the need for providing care to the whole patient.

Failure to Listen

Failure to listen to cues in the patient's responses and conversation can occur from a lack of concentration on what the patient says—an absence of use of active listening skills (refer to previous discussion of Listening Skills on page 194). Patients might or might not feel to be able to speak freely to the nurse. Often, the signals indicating their readiness to talk are subtle. Do not miss valuable opportunities for important communication by approaching patients with a closed mind or focusing on your own needs rather than on the patient's needs. Nurses who lack confidence in their own ability to meet the challenges a patient presents might become defensive in response to a patient's comments. Nurse defensiveness is a huge barrier to open and trusting communication.

Nontherapeutic Comments and Questions

Certain types of comments and questions should be avoided in most situations because they tend to impede effective communications. A description of each type follows.

Clichés

A **cliché** is a stereotyped, trite, or pat answer. Most health care clichés suggest that there is no cause for anxiety or concern, or they offer false assurance. Patients tend to interpret them as a lack of real interest in what they have said. For example, even though the common question "How are you?" could start a conversation, it can cause a problem if patients hearing this suspect that the nurse is not sincerely interested in how they feel. Avoid the following common clichés because they tend to impede effective communication:

"Everything will be all right."
"Don't worry. You will be just fine in another day or two."
"Your doctor knows best."
"Cheer up. Tomorrow is another day."

Another type of cliché makes a sweeping generalization that does not necessarily apply to a specific patient. It also tends to cut off communications and makes people feel as though they are insignificant. Consider the following examples:

"Men tolerate pain poorly. That must be why you are complaining of severe pain."
"Everybody is afraid of surgery. Why should you be any different?"
"You teenagers are all alike. You aren't cooperative because you deny authority."

Such comments rarely promote communication with the patient to whom they are addressed.

Questions Requiring Only a Yes or No Answer

Questions that can be answered by simply saying yes or no tend to cut off discussion, even when the person might wish to continue. Consider the following question:

Nurse: Did you have a good day?

The question begs for a noncommittal answer, which tells the nurse little. This is a better question:

Nurse: Tell me about your sessions in therapy. How did you feel they went today?

Another pitfall is to pose a question to which the patient can say no when that answer could present a problem. Consider the following question that a nurse asks a postoperative patient:

Nurse: Are you ready to get out of bed?

By offering the patient the chance to say no, the nurse might have created difficulties if the patient should be getting out of bed.

At times, of course, questions that can be answered with yes or no are appropriate, such as in these examples:

Nurse: Did you take your insulin before breakfast this morning?
Nurse: Do you have pain when I move your arm this way?

The problem with yes or no questions arises when seeking more detailed information or when the question might create difficulty.

Questions Containing the Words Why and How

Questions using the words *why* and *how* may be intimidating to many patients. Consider the following questions:

Nurse: Why were you not tired enough to sleep?
Nurse: How did you ever decide to go on a crash diet?

These two questions would be better stated as follows:

Nurse: What were you doing while you were unable to sleep?
Nurse: What things prompted you to decide to go on a crash diet?

Questions that Probe for Information

Questions that too obviously probe for information might cut off communication. Patients who are made to feel as though they are receiving the "third degree" become resentful, usually stop talking, and try to avoid further conversation. Although more information might be needed, it is better to follow the patient's lead. Letting the patient take the initiative allows you to delve more deeply at a time when the patient is ready. A nurse who says, "Let's get to the bottom of this" is likely to destroy conversation, unless the patient is ready to face the real cause of the problem.

Leading Questions

A leading question suggests what response the speaker wishes to hear. Leading questions tend to produce answers that might please the nurse but are unlikely to encourage the patient to respond honestly without feeling intimidated. Consider the following examples:

Nurse: You aren't going to smoke that cigarette, are you?
Nurse: You have been well cared for by your nurses, haven't you?

These questions direct patients to give an answer that pleases the nurse rather than to express their own thoughts.

Comments that Give Advice

Giving advice often implies that the nurse knows what is best for patients and denies them the right to make decisions and have feelings. It also tends to increase the patient's dependence on caregivers. However, advice does have a rightful place when it is requested and when the person giving the advice has expert knowledge that the patient does not.

Judgmental Comments

Judgmental comments tend to impose the nurse's standards on the patient. Consider the comment of a nurse who notes that a young woman is crying:

Nurse: You aren't acting very grown up. How do you think your husband would feel if he saw you crying like this?

The nurse judges the patient as being immature, and the nurse's apparent hostility could end effective communication. A better comment in this situation might be as follows:

Nurse: I would like to help. Tell me, what is making you cry?

Consider the following exchange between a nurse and a patient about to have surgery:

Patient: I think I have a right to be afraid of this operation.
Nurse: Tell me what makes you feel afraid.

This patient is likely to feel safe when allowed to express feelings without being judged.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Remember **Susie Musashi**, the 3-year-old with burns who is crying. A response such as "You're acting like a baby. You're a big girl now" would be intimidating, especially to a young child who is striving for acceptance. Instead, a response such as "Can you tell me what is making you cry or feel so sad?" would allow the child to verbalize her concerns without feeling intimidated or scolded. This response also would help in establishing a trusting nurse–patient relationship.

Changing the Subject

A quick way to stop conversation is to change the subject. Rejection of a topic by the nurse closes it off from exploration (Hays & Larson, 1963, as cited in Videbeck, 2020, p. 100). The patient might be at a point of readiness to discuss something and will likely feel frustrated if put off by a change in the topic of conversation. Or, the patient may feel personally rejected along with expressed ideas or topic (Hays & Larson, 1963, as cited in Videbeck, 2020, p. 100). Consider this example:

Patient: When can I expect to be told about my insulin?
Nurse: Let's discuss your diet now so that you will know what to eat when you get home. We can discuss your insulin some other time.

A nurse might also change the subject when feeling uncomfortable about the topic of conversation (Videbeck, 2020). For example, the patient's needs are being met when the nurse allows the patient to speak of impending death, thoughts of suicide, or contemplated abortion. The nurse is ignoring the patient, however, if the nurse changes the subject because of feeling uncomfortable talking about it.

Giving False Assurance

Because it is easier and more pleasant to deal with positive outcomes than negative outcomes, nurses might try to convince the patient that things are going to turn out well even when knowing the chances are not good. False assurance might give patients the impression that the nurse is not interested in their problems. The use of clichés gives a patient false assurance. Communication might be impeded when providing the patient and family with false assurance. If you inadvertently do use false assurance, then you should explain with an apology and implement effective communication techniques.

Gossip and Rumor

Gossip and rumor are common forms of communication, particularly in health care settings, sometimes referred to as "the grapevine." Gossip and rumor can produce detrimental effects on relationships and group building. Gossiping might be used to inform, influence others, entertain, or ventilate. It can be harmless but could also damage the reputation of others. Rumors serve similar functions but become more widespread. Both rumors and gossip might cause blocks to team building and damage the reputations of the people who are the subject of the information.

DISRUPTIVE INTERPERSONAL BEHAVIOR AND COMMUNICATION

Disruptive behavior has a negative effect on clinical outcomes and interpersonal relationships, and includes incivility, bullying, and aggressive patient and family behavior. Adverse events occur when communication between health care professionals is ineffective, abusive, or negative. The Joint Commission established a leadership standard that requires hospitals and other accredited institutions to establish a code of conduct defining acceptable, disruptive, and unacceptable behavior (The Joint Commission, 2016). This standard also mandates facility leaders to create and implement a process for managing unprofessional and inappropriate behaviors when they occur (The Joint Commission, 2016). In addition, the Joint Commission advises hospitals to educate all staff about the code of conduct, develop reporting systems, use mediators when necessary, and document all efforts to address unacceptable behavior (The Joint Commission, 2016). Disruptive interpersonal behavior compromises patient safety, influences satisfaction with care, decreases productivity, and contributes to health care errors and poor patient and staff outcomes (Clark, 2019; Layne et al., 2018).

Incivility and Bullying

Incivility is rude, disruptive, intimidating, and undesirable verbal and nonverbal communication and behaviors directed at another person (Clark, 2019). Incivility also includes failing to act when action is warranted, such as refusing to assist a coworker or share important information about a patient's care, or remaining silent while others are treated with disrespect (ANA, 2015). Incivility is considered by some as a precursor to bullying behavior or lateral violence, and by others as a form of bullying (Armstrong, 2018).

Anger and aggressive behavior between nurses, or nurse-to-nurse hostility, has been labeled **horizontal violence**. This negative behavior is also referred to as **bullying**, **lateral violence**, and professional incivility. All are breaches in the workplace norms of respect and courtesy and forms of psychological and social harassment and involve covert or overt behaviors (McPherson & Buxton, 2019; Millis, 2018). Bullying occurs when a person is subjected to intimidating

behaviors that have a negative effect on them; the conduct is persistent and may involve direct physical or verbal behaviors or indirect behaviors (Meires, 2018a; Millis, 2018). Covert bullying includes withholding information from a colleague, gossiping and spreading rumors, using nonverbal communication such as eye-rolling and other body language, and social isolation. Overt bullying behaviors include accusing a nurse of errors made by someone else (scapegoating) or humiliating a person in the presence of others.

Bullying behaviors and communication occur in all health care environments and affect nurses at all levels of practice, including new graduates and nursing. The potential source of the disruptive behavior, the bully, may be a coworker, a supervisor, or another health care provider. Many nurses choose to leave the workplace or unit to find a "bully-free" place to work (Bambi et al., 2019; Sauer & McCoy, 2018).

The physical and emotional toll on those employed in a toxic work environment can be significant. Commonly reported physical consequences include frequent headaches, sleep disturbances, gastrointestinal symptoms, and decreased energy (Lever et al., 2019). Psychological manifestations, such as an increased level of stress, anxiety, fear, frustration, and loss of self-esteem, can result in burnout, emotional exhaustion, depression, and suicidal ideation or attempt (Bambi et al., 2019; Lever et al., 2019). Bullying is associated with nursing practice errors and affects patient safety and patient outcomes; in addition, teamwork is negatively influenced, resulting in deterioration in the quality of care and a greater potential for error (Johnson & Benham-Huchins, 2020; Meires, 2018a).

Verbally and Physically Aggressive Patients

Adverse events also occur when nurses and other health care professionals care for verbally and/or physically abusive patients. Aggression in health care settings can take many forms and occurs for numerous reasons (Baby et al., 2019). Workplace violence is defined as violent acts, including physical assaults and threats of assault, directed toward persons at work on duty (NIOSH, 2014). Patient and/or family violence ranges from verbal harassing, threatening, yelling, bullying, and hostile sarcasm to physical slapping, punching, biting, and throwing of objects (Locke et al., 2018). Refer to the Vulnerable Population Alert 8-1: Nurses Caring for Verbally and Physically Abusive Patients for additional information and resources related to this issue.

Decreased quality of communication may be interpreted as a lack of caring and support, with resulting decreased satisfaction with the level of nursing care. Poor-quality communication between the nurse and the patient and/or family and decreased patient/family satisfaction may make people more likely to justify aggressive behavior toward the nurse (Yagil & Dayan, 2020). The U.S. Department of Labor Occupational Safety and Health Administration (OSHA) (2016) has established guidelines for preventing workplace violence for health care and social service workers. Health care institutions are encouraged to develop workplace violence prevention programs, document reports of violence, investigate reported events in a timely manner, and provide training on workplace violence for all workers (Benyon, 2019; OSHA, 2016; Zuzelo, 2020). Clearly developed policies and procedures must be in place and include a policy of zero tolerance (American Association of Critical-Care Nurses, 2019; American Nurses Association, 2015; Zuzelo, 2020). A nurse subject to verbal and/or physical aggression is a victim of violence, regardless of the etiology of the attack; such attacks cannot be considered an expected part of nursing (Zuzelo, 2020).

Vulnerable Population Alert 8-1: Nurses Caring for Verbally and Physically Abusive Patients

An Occupational Health and Safety Report states that violence and assault against health care workers, especially nurses, is on the rise—and some studies suggest it has spiked nearly 110% (Occupational Health & Safety, 2020).

A number of surveys (OSHA, 2015c) highlight the prevalence of violence among different health care professions and found that:

- 21% of registered nurses and nursing students reported being physically assaulted—and 50% verbally abused—in a 12-month period
- 12% of emergency department nurses experienced physical violence—and 59% experienced verbal abuse—during a 7-day period
- 13% of employees in Veterans Health Administration hospitals reported being assaulted in a year

Health care worker safety affects companies and businesses too. OSHA (2015) reports that between 2002 and 2013, incidents of serious workplace violence (those requiring days off for the injured worker to recuperate) were four times more common in health care than in private industry on average. The costs to help a worker who has suffered violence or hire a new nurse can be immensely high—sometimes as much as $103,000.

Workplace Violence Prevention Resources

- American Nurses Association (ANA, 2019b) provides information about different levels of violence and laws and regulations. Access the ANA position statement on incivility, bullying, and workplace violence. See https://www.nursingworld.org/practice-policy/advocacy/state/workplace-violence2/.

Communication is the first line of defense against patient violence (Locke et al., 2018). Nurses should use effective, therapeutic communication techniques (discussed earlier in the chapter) to build trust, establish a rapport, meet patient and family expectations, and validate feelings as well as respond to patient needs (Baby et al., 2019; Locke et al., 2018). Nurses should also be prepared to use appropriate responses to disruptive and/or aggressive behavior as outlined in the next section.

Responses to Disruptive Behaviors and Communication

When disruptive behavior occurs, it is best to maintain a professional demeanor, respond assertively and address the issue directly with those involved (Meires, 2018b). If this is not possible, ask to speak to the person in private and address any disrespectful remarks or behaviors. Nurses may also see guidance and support through nurse-managers and/or other appropriate channel, as outlined by the institution (American Nurses Association, 2015). Nurses should factually document the occurrence of any bullying behaviors. Facility administrative policies and procedures should be implemented to deal with individual situations in a constructive manner.

Addressing disruptive behaviors requires the determination that bullying and other behaviors and inappropriate communication will no longer be tolerated in order to promote a healthy work environment. The previously discussed standard from The Joint Commission (2016) regarding preventing disruptive behaviors in health care facilities includes the following key recommendations:

- Education must be provided for all staff regarding respectful, professional behavior and communication. (See the accompanying Research in Nursing box on page 202.)
- All staff members must be held accountable for their behavior and use of communication techniques.
- Zero-tolerance policies must be implemented regarding disruptive behaviors, and protection must be provided for those who report these behaviors and communication.
- Those in leadership positions must attend training regarding professional standards of behavior and communication techniques and function as a positive role model.
- Surveillance and reporting systems must be available to identify unprofessional behaviors and communication.
- Emphasis must be placed on the importance of documenting bullying behaviors and disruptive communication.

Research in Nursing

BRIDGING THE GAP TO EVIDENCE-BASED PRACTICE

Workplace Incivility

Incivility and bullying behaviors in the workplace contribute to toxic work environments. These disruptive behaviors negatively affect health care providers and can lead to nurse turnover and impact retention of nurses. Communication issues are a component of bullying and workplace incivility. Can increased awareness of incivility and communication strategies reduce incivility?

Related Research

Howard, M. S., & Embree, J. L. (2020). Educational intervention improves communication abilities of nurses encountering workplace incivility. *The Journal of Continuing Education in Nursing, 51*(3), 138–144. https://doi:10.3928/00220124-20200216-09

This quasi-experimental mixed-method study examined the use of an educational intervention to increase the awareness and knowledge of incivility and bullying and enhance the communication skills of novice nurses. Twenty-

eight nurses who had completed general nursing orientation within the past year were assigned to the control group. Twenty-one nurses who were in general nursing orientation programs at the time of the study were assigned to the experimental group. The majority (67.3%) of participants had less than 3 years of experience as a nurse. All participants completed the Workplace Civility Index (WCI), an evidence-based questionnaire used to assess nurses' sense of civility and to increase awareness related to personal actions and intensions. Lower WCI scores signify very uncivil behavior; higher scores indicate very civil behavior. The nurses in the experimental group then completed an asynchronous, learner-paced e-learning educational activity designed to encourage productive communication and dialogue, increase awareness and knowledge of incivility and bullying, and increase participants' ability to engage in difficult conversations successfully. The control group did not receive any intervention. All participants completed the post-WCI. WCI scores improved significantly for the experimental group post intervention ($p < .00001$). The WCI scores decreased significantly for the control group ($p = .000227$). The researchers suggested this decrease was a result of increased self-awareness and self-reflection of uncivil behavior on the part of the control group participants. All participants in the experimental group noted the successful use of a positive conflict-management strategy in the workplace to address an issue after the educational intervention. The researchers concluded that an asynchronous, learner-paced e-learning educational activity is an effective intervention to decrease incivility and increase perceived comfort levels during critical conversations between nurses and other health care providers.

Relevance to Nursing Practice

Workplace mistreatment negatively affects the well-being of nurses and can have detrimental effects. Nurses must act in a manner that demonstrates that bullying and other negative behaviors will not be tolerated in order to promote a healthy work environment. Nurses must develop skills to respond assertively and address this issue directly with those involved. One way to address incivility is through educational activities to encourage use of productive and critical communication skills and increase awareness of incivility. A proactive approach has the potential to increase job satisfaction, foster personal growth, and positively affect the retention of registered nurses.

The ANA states that nurses and employers in all settings have an ethical, moral, and legal responsibility to create a healthy and safe work environment for nurses and all members of the health care team, health care consumers, families, and communities (ANA, 2015). Nurses and their employers must collaborate to create a culture of respect that is free of incivility, bullying, and workplace violence (ANA, 2015).

Nurses who refuse to be victims can help break the cycle of violence. Once bullying and other disruptive behavior and communication are recognized as problems, the need for a culture change is evident. Education is crucial. Nurses need to learn effective communication strategies to combat bullying and react to aggressive behaviors (Baby et al., 2019; Locke et al., 2018; Meires, 2018a). Assertiveness and aggression training are effective in addressing these issues. Threats or violent behavior require a calm attitude before interacting with the aggressor; being upset will escalate the situation (Curtin, 2019). Proactive response includes learning how to react professionally and protectively "in the moment"; documenting and reporting the incident; welcoming new nurses; using conflict-management strategies when responding to aggressive behavior; and insisting that the disruptive behavior and communication are addressed. Nurses who have always cared for others need to also care for themselves and their peers.

An organizational response coupled with individual nurses' efforts to address disruptive behaviors and communication at all levels can create a healthy work environment, positively affect job satisfaction, improve the retention of nurses, and result in more positive patient outcomes.

IMPAIRED VERBAL COMMUNICATION

The ability to communicate is our most human characteristic. Human communication is essential for learning, working, and social interaction. Impaired communication can affect every aspect of a person's life. Impaired verbal communication is a decreased, delayed, or absent ability to use speech.

Specific communication strategies may be necessary for patients with impaired verbal communication. There are many reasons for verbal communication impairments. For example, older adults may have speech, language, and hearing disorders. Nurses and other caregivers should avoid "elderspeak" when communicating with older adults. Elderspeak involves using diminutive words, exaggerated voice intonation, high pitch, and exaggerated punctuation that imply that the older adult is not competent. Elderspeak is non–person-centered communication based on stereotypes of older adults and is a form of ageism (Williams et al., 2018). Children and adults may have neurodevelopmental issues, such as autism spectrum disorder, traumatic brain injury, and dementia, which may contribute to impairment in communication. Strategies to address impairments in verbal communication include use of a calm and reassuring approach, use of nonverbal gestures to aid the patient in understanding what is being communicated, and seeking clarification and validation to ensure that the intended messages have been conveyed (Townsend & Morgan, 2018). Communication adjustments may be necessary but must be respectful, positive, and individualized. Chapter 24 also addresses communication with older adults.

Box 8-6 **Communicating With Patients Who Have Special Needs**

Patients Who Are Visually Impaired

- Acknowledge your presence in the patient's room.
- Identify yourself by name.
- Remember that the visually impaired patient will be unable to pick up most nonverbal cues during communication. Speak in a normal tone of voice.
- Explain the reason for touching the patient before doing so.
- Indicate to the patient when the conversation has ended and when you are leaving the room.
- Keep a call light or bell within easy reach of the patient.
- Orient the patient to the sounds in the environment and to the arrangement of the room and its furnishings.
- Be sure the patient's eyeglasses are clean and intact or that contacts are in place.

Patients Who Are Deaf or Hard of Hearing

- Orient the patient to your presence before initiating conversation. This may be done by gently touching the patient or moving so that you can be seen.
- Talk directly to the patient while facing them. If the patient is able to lip read, use simple sentences and speak in a quiet, natural manner and pace. Be aware of nonverbal communication.
- Do not chew gum or cover your mouth when talking with the patient.
- Demonstrate or pantomime ideas you wish to express, as appropriate.
- Use sign language or finger spelling, as appropriate.
- Write any ideas that you cannot convey to the patient in another manner.
- Be sure that hearing aids are clean, functioning, and inserted properly.

Patients With a Physical Barrier (Laryngectomy or Endotracheal Tube)

- Select one or more simple means of communication that the patient is physically able to use. Options include eye blinks or hand squeezes to communicate yes or no; writing pads or magic slates; communication boards with words, letters, or pictures; flash cards; sign language.
- Be sure that everyone communicating with the patient—family, friends, and caregivers—understands and is able to use the communication devices selected.
- Demonstrate patience with the time needed to communicate effectively, and reinforce the patient's efforts.
- Ensure that the patient has an effective means of signaling need for assistance, such as a call bell or alarm.

Patients Who Are Cognitively Impaired

- Establish and maintain eye contact with the patient to hold attention.
- Communicate important information in a quiet environment where there is little to distract the patient's attention.
- Keep communication simple and concrete. Break down instructions into simple tasks and avoid lengthy explanations. Do not use pronouns or abstract terms. Use pictures or drawings when appropriate.
- Whenever possible, avoid open-ended questions. Ask "Would you like to wear the brown pants or the gray pants?" instead of "What would you like to wear?"
- Be patient and give the patient time to respond. If the patient does not respond after 2 minutes, repeat what you said. If there is still no response, take a break before continuing the conversation so that neither you nor the patient becomes frustrated.

Patients Who Are Unconscious

- Be careful of what is said in the patient's presence. Hearing is believed to be the last sense lost; therefore, the unconscious patient is often likely to hear even though there is no apparent response.
- Assume that the patient can hear you. Talk in a normal tone of voice about things you would ordinarily discuss.
- Speak with the patient before touching. Remember that touch can be an effective means of communication with the unconscious patient.
- Keep environment noises at as low a level as possible. This helps the patient focus on the communication.

Patients Who Do Not Speak English

- Use an interpreter whenever possible.
- Use a dictionary that translates words from one language to another so that you can speak at least some words in the patient's language.
- Speak in simple sentences and in a normal tone of voice.
- Demonstrate or pantomime ideas you wish to convey, as appropriate.
- Be aware of nonverbal communication. Remember that many nonverbal communication cues are universal.

The causes of hearing loss include chronic ear infections, heredity, birth defects, health problems at home, certain drugs, head injury, viral or bacterial infection, exposure to loud noise, aging, and tumors. Causes of speech and language disorders are related to hearing loss, cerebral palsy, and other nerve and muscle disorders; severe head injury; stroke (brain attack); viral diseases; cognitive, intellectual, or developmental disabilities; certain drugs; physical impairments, such as cleft lip or palate; vocal abuse or misuse; and inadequate speech and language. Box 8-6 offers guidelines for communicating with patients with special needs.

When caring for **Irwina Russellinski**, the older adult woman transferred after being treated for pneumonia, the nurse needs to investigate the cause and degree of the patient's hearing loss and what, if any, treatments or measures have been used to manage the problem. The nurse also needs to gather additional data about the patient's confusion and her cultural background. Based on this information, the nurse would be able to develop a plan of care that addresses Mrs. Russellinski's needs.

A nurse who suspects a speech, language, or hearing problem should refer the patient to a speech–language pathologist or audiologist. A speech–language pathologist is a professional educated in the study of human communication, its development, and its disorders. An audiologist is a professional educated in the study of normal and impaired hearing.

REFLECTIVE PRACTICE LEADING TO PERSONAL LEARNING

Remember that the goal of reflective practice is to look at an experience, understand it, and learn from it. As you begin to develop the use of and expertise in professional therapeutic communication, reflect on your experiences—successes and failures—in order to improve your practice. How can you do it better the next time? What did you learn today that can help you tomorrow? Begin your reflection by paying close attention to the following while providing nursing care:

- Did your preparation and practice related to the use of verbal and nonverbal communication techniques result in your feeling confident in your ability to communicate with your patient and their family? Did your competence and confidence inspire the patient's and family's trust?
- How did you prioritize the data you collected? What patterns in the data did you identify? What knowledge from your learning, personal experience, and intuition did you use to make decisions and develop your plan of care?
- How confident are you that you have successfully communicated information to other members of the health care team?
- Were you aware of any cultural or ethnic beliefs or practices that may have influenced your communication or development of a relationship with patients or family members? Were you aware of any stereotypes or prejudices that may have negatively influenced an encounter? If so, how did you address these?
- Was the patient's or family's participation in the process at an optimal level? How may you have better engaged the patient and family? Did the patient sense that you are respectful, caring, and competent?

Perhaps the most important questions to reflect on are: Are your patients and their families/caregivers better for having had *you* share in the critical responsibility of being a part of their health care team? Are your patients now receiving thoughtful, person-centered, prioritized, holistic, evidence-based treatment and care because of your efforts?

DEVELOPING CLINICAL REASONING AND CLINICAL JUDGMENT

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

. Working with another student, attempt to express the following using nonverbal communication only:

- I am in pain.
- I am genuinely concerned about your well-being.
- I couldn't care less that you are my patient, and I wish I were anywhere else but here caring for you.
- I am afraid that you will hurt me.

. Describe what this exercise can teach you about the importance of nonverbal communication. Explain how this understanding will influence your nursing practice.

. Conversation is both an art and an essential nursing tool. If you had 30 minutes to spend with each of the following patients while doing a procedure that allows you to communicate, what would you talk about (communicate) and why? Compare your answers with another student's, and explore what your conversations would communicate to the patients involved.

- An older adult recently admitted to a long-term care facility
- A 6-year-old boy newly admitted to a hospital for asthma
- An HIV-positive, 33-year-old man who has just been given the news that he has acquired immunodeficiency syndrome (AIDS)
- A 45-year-old amputee who has been in a rehabilitation hospital for 3 weeks after a motorcycle accident
- A 19-year-old woman who has just had an elective abortion and is in the recovery unit
- An unconscious patient in a critical care unit

. An experienced nurse observes your distress after leaving the room of a patient who has just told her family that her cancer has recurred and is in an advanced state. She tells you that you better "toughen up" if you want to survive in nursing. She counsels not getting emotionally involved with patients and families: "Become a rock." How do you respond to this nurse and why? Of what value, if any, is empathy?

PRACTICING FOR NCLEX

. The charge nurse overhears an AP yelling loudly to a patient who is hard of hearing, while transferring them from the bed to a chair. Upon entering the room, which response by the charge nurse is most appropriate?

a. "Please speak more quietly so you don't disturb the other patients."
b. "Let me help you with your transfer technique."
c. "When you are finished, be sure to apologize for shouting."
d. "When your patient is safe and comfortable, meet me at the desk."

. A public health nurse is leaving the home of a young mother who has an infant with special needs. The neighbor states, "How is she doing, since the baby's father is no help?" What is the nurse's best response?

a. "New mothers need support."
b. "The lack of a father is difficult."
c. "How are you today?"
d. "It is a very sad situation."

. A toddler with vomiting, diarrhea, and dehydration is being seen at an acute care center. During the admission interview, what question will the nurse ask the parents to elicit the most useful information?

a. "Watching your child vomiting and in discomfort must have been scary."
b. "This started yesterday, correct?"
c. "Has this child has had anything to drink?"
d. Could you tell me the color and approximate amount of the vomiting?

. A nurse enters a patient's room and examines the patient's intravenous (IV) fluids and cardiac monitor. When asked, "who are you?", which response by the nurse is most appropriate?

a. "I'm just the IV therapist checking your IV."
b. "I've been transferred to this division and will be caring for you."
c. "I'm sorry, my name is John Smith and I am your nurse."
d. "I am John Smith, your nurse, and I'll be caring for you until 11 PM."

. A nurse enters the room of a patient with cancer. The patient is crying and states, "I feel so alone." How will the nurse best communicate a therapeutic response?

a. The nurse stands at the patient's bedside and states, "I understand how you feel. My mother said the same thing when she was ill."
b. The nurse places a hand on the patient's arm and states, "You feel so alone."
c. The nurse stands in the patient's room and asks, "Why do you feel so alone? Your wife has been here every day."
d. The nurse holds the patient's hand and asks, "Tell me what feeling so alone is like for you?"

. A primary nurse is preparing a discharge plan for a patient who has been hospitalized following a double mastectomy. Which statement is most appropriate for the nurse to use in the termination phase of the therapeutic relationship?

a. "Let's review the progress you've made in meeting your goals."
b. "I'd like to review your medication schedule with you."
c. "I need to document today's teaching session in the electronic health record."
d. "Should we include your family in today's session?"

. A nursing student is nervous and concerned about working at a clinical facility. Which action would best decrease anxiety and help ensure successful delivery of patient care?

a. Determining the established goals of the institution
b. Ensuring that verbal and nonverbal communication is congruent
c. Engaging in self-talk to plan the day and decrease fear
d. Speaking with fellow colleagues about how they feel

. A nurse says to their nurse manager, "I need the day off, and you didn't give it to me!" The manager replies, "I wasn't aware you needed the day off, and it isn't possible since staffing is inadequate." How could the nurse best modify the communication for a more positive interaction?

a. "I placed a request to have 8th of August off for a doctor's appointment, but I'm scheduled to work."
b. "Could I make an appointment to discuss my schedule with you? I requested the 8th of August off for a doctor's appointment."
c. "I will need to call in on the 8th of August because I have a doctor's appointment."
d. "Since you didn't give me the 8th of August off, will I need to find someone to work for me?"

. During a nursing staff meeting to discuss delayed documentation, the nurses unanimously agree that they will ensure all vital signs are reported and charted within 15 minutes following assessments. This decision is consistent with which characteristics of effective communication? Select all that apply.

a. Group decision making
b. Group leadership
c. Group power
d. Group identity
e. Group patterns of interaction
f. Group cohesiveness

. A nurse notices a patient is walking to the bathroom with a stooped gait, facial grimacing, and grunting sounds. Based on these nonverbal cues, what action will the nurse take next?

a. Assess for pain and the need for analgesia.
b. Ask the patient if they feel anxious.
c. Offer to sit with the patient and listen to their feelings.
d. Suggest the patient increase their fluid intake to prevent constipation.

. A nursing student is preparing to administer morning care to a patient. What question by the student is most important to ask?

a. "Would you prefer a bath or a shower?"
b. "May I help you with a bed bath now or later this morning?"
c. "I will be giving you your bath. Do you use soap or shower gel?"
d. "I prefer a shower in the evening. When would you like your bath?"

. A nurse enters a patient's room and finds them vomiting bright red blood. After taking vital signs, the nurse communicates the event to the health care provider using the SBAR format. Which information will the nurse include in the "A" portion of the SBAR communication?

Exhibit: Electronic health record (EHR)

Past medical history	Vital Signs
Peptic ulcer	T 98.8°F, P 111, RR 20, BP 98/50
Bleeding disorder	Pulse oximetry 96%

a. Admitted with peptic ulcer and bleeding disorder
b. Found vomiting in bathroom
c. Anti-ulcer medication recommendation
d. Vital signs, oxygen saturation, bright red emesis

. The nurse preceptor and a new graduate nurse on the surgical unit are performing preoperative assessments on a group of patients. What statement by the graduate nurse requires the preceptor to intervene?

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

a. "I am sure everything will be fine; you have nothing to worry about."
b. "When you return from surgery, you'll need to cough and deep breathe."
c. "Many people on this unit have had that procedure with good success."
d. "You seem fearful, can I answer any questions about the procedure?"

. A patient states, "I have been experiencing complications of diabetes." What question will the nurse use to elicit additional information?

a. "Do you take two injections of insulin to prevent complications?"
b. "Are you using diet and exercise to help regulate your blood sugar?"
c. "Have you been experiencing the complications of neuropathy?"
d. "Can you tell me about the complications you've experienced?"

. During an interaction with a patient diagnosed with epilepsy, a nurse notes that the patient is silent after hearing the plan of care. How does the nurse best respond? Select all that apply.

a. Fill the silence with lighter conversation directed at the patient.
b. Use the time to perform the care that is needed uninterrupted.
c. Discuss the silence with the patient to ascertain its meaning.
d. Allow the patient time to think and explore inner thoughts.
e. Determine if the patient's culture requires pauses between conversation.
f. Arrange for a counselor to help the patient cope with emotional issues.

ANSWERS WITH RATIONALES

. **d.** The charge nurse should direct the AP to see to the patient's safety, then address any concerns privately. The nurse then can discuss appropriate use of therapeutic communication.

. **a.** The nurse must maintain confidentiality when providing care. The statement "New mothers need support" is a general statement that all new parents need help. The statement is not judgmental of the family's roles. "How are you today?" is dismissive of the neighbor's question.

. **d.** Using a clarifying question or comment allows the nurse to gain an understanding of the parents' observations, avoiding misunderstandings that could lead to an inappropriate nursing diagnosis. A reflective question technique involves repeating what the person has said or describes the person's feelings. Assertive questions are direct, demonstrating the ability to stand up for self or others, using open and honest communication. Open-ended questions encourage free verbalization and expression of what the parents believe to be true.

. **d.** The nurse should identify themselves, ensure the patient knows what will be happening, and the duration of their relationship.

. **d.** The use of touch conveys acceptance, and the implementation of an open-ended question allows the patient time to verbalize freely.

. **a.** The termination phase occurs when the conclusion of the initial agreement is acknowledged. Discharge planning correlates with the termination phase of a therapeutic relationship and the progress toward the patient's goals are reviewed.

. **c.** By engaging in positive self-talk, or intrapersonal communication, the nursing student can plan the day, decrease fear and anxiety, and enhance clinical performance.

. **b.** Effective communication involves sending clear, nonthreatening, and respectful information to the receiver. The nurse identifies the subject of the meeting and determines a mutually agreed upon time.

. **a, d, e, f.** Solving problems involves group decision making; ascertaining the task is important and agreeing to complete the task on time is characteristic of group identity. Group patterns of interaction involve honest communication and member support; cohesiveness occurs when members generally trust each other, have a high commitment to the group, and a high degree of cooperation. Group leadership occurs when groups use effective styles of leadership to meet goals; with group power, sources of power are recognized and appropriately used to accomplish group outcomes.

. **a.** A patient who presents with nonverbal communication of a stooped gait, facial grimacing, and grunting sounds is most likely communicating pain. The nurse should clarify this nonverbal behavior.

. **b.** The nurse should ask permission to assist the patient with a bath. This allows for patient preferences and consent for care that involves entering the patient's personal space.

. **d.** The SBAR method is used to improve hand-off communication. SBAR, which stands for Situation, Background, Assessment, and Recommendations, provides a clear, structured, and easy to use framework. Vital signs, oxygen saturation, and the presence of emesis and its color are assessments.

. **a.** Telling a patient that everything will be fine is a cliché. This statement gives false assurance and may give the

patient the impression that the nurse is dismissive of a patient's concerns or condition.

- **d.** Requesting information regarding the patient's specific complications of diabetes will guide the nurse to further questioning and related assessments.
- **c, d, e.** Appropriate use of silence allows the patient to initiate or to continue speaking; the nurse can reflect on what has been shared while observing the patient without having to concentrate simultaneously on conversation. In due time, the nurse might discuss the meaning of silence with the patient. The nurse considers whether the patient's culture may require longer pauses between verbal communication. Fear of silence sometimes leads to excessive talking by the nurse, displacing focus from the patient. The nurse should not assume silence requires a consult with a counselor.

Teaching and Counseling

Marco García Ramírez

Marco accompanies his wife, Claudia, to the antepartal clinic for a routine visit. They are expecting their first child in 5 months. He reports that they are happy and excited but also scared and very nervous. They are planning for a home birth, asking lots of questions about childbirth and their new responsibilities as parents: “We’re both wondering if we’ll be good parents.”

Rachel Blumenthal

Rachel, age 40, is the second wife of a 57-year-old man who has suffered a serious myocardial infarction. They have been married for only 1 year. She says, “I’m a little embarrassed to talk with the cardiologist, but I have lots of questions about what my husband will be able to do after he gets home. I’m also wondering about resuming sexual activity.”

Alicia Bonet

Alicia is the young mother of a baby boy; the baby’s health care provider is recommending that he start

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

long-term aspirin therapy. Ms. Bonet is quite concerned about agreeing to long-term aspirin therapy and asks, “I’ve heard so much about Reye syndrome and aspirin. What should I do? What would you recommend?”

Learning Outcomes

After completing the chapter, you will be able to accomplish the following:

. Describe the teaching–learning process.
. Describe factors that are assessed in the learning process.
. Discuss strategies to improve health literacy and promote patient safety.
. Describe factors that influence adherence with the therapeutic plan.
. Formulate diagnoses/patient problems for identified learning needs.
. Explain how to create and implement a culturally considerate, age-specific teaching plan for a patient.
. Discuss the role of a nurse coach in promoting behavior change.
. Identify methods for evaluating learning.
. Explain what should be included in the documentation of the teaching–learning process.
. Discuss the nurse’s role as a counselor.
. Describe how the nursing process is used to help patients solve problems.
. Explain how patient education and counseling is used to motivate a patient toward health promotion.

teaching method

One of the most important nursing roles involves helping patients and their families learn how to respond to their health care problems and how to promote health. Many patients lack the knowledge and self-care abilities they need to achieve their health goals. To work effectively with patients, nurses must be skilled teachers and counselors. Both roles require strong communication skills. Many factors have contributed to an intensified need for effective patient teaching and counseling: current trends toward shorter hospital stays and decreased time for interactions between health care professionals and patients, dependence on complex technologies, an increased emphasis on health promotion, consumer empowerment, cost containment, and an increase in chronic illness. Nurses are challenged with the task of creating an environment conducive to learning that motivates individuals to want to learn and makes it possible for them to learn—a learner-centered approach (Bastable, 2019; Sykes et al., 2013, as cited in Bastable, 2019, p. 16). Nurses are facilitators (Bastable, 2019), engaging patients and their family/caregivers as partners in the learning process and challenged by limited time and resources and patients who may or may not be ready, willing, or able to learn. Refer to the accompanying Reflective Practice box for one student's experience in responding to a request from a patient's family member for information to help in making an informed health care decision.

Never has the demand for quality education and counseling been greater. Nurses who are skilled educators and counselors can improve patients' health and well-being and reduce the demand for professional services. Current trends in health care are making it essential that patients are prepared to assume responsibility for self-care management (Bastable, 2019). Nurses must ensure that patients, families, and caregivers receive the information they need and demonstrate learning essential knowledge and skills to maintain optimal health. The Institute of Medicine (IOM, 2001) identified the importance of education in patient- and family-centered care in their report *Crossing the Quality Chasm,* proposing that access to understandable health information is essential to empower patients to participate in their care, and patient-centered organizations take responsibility for providing access to that information. (Note: The IOM titling has changed in recent years and is now referred to more broadly as The National Academies of Sciences, Engineering, and Medicine.) It is critical for health care professionals to inform and engage patients in their own health care through education (IOM, 2013). The Joint Commission (n.d.a) reinforced the importance of and supported this crucial need for educating patients by sponsoring the Speak Up initiative. This patient safety program aims to empower and educate patients and make them a partner in their care. The Speak Up campaign features infographics, animated videos, and brochures, and use has expanded to more than 70 countries (The Joint Commission, n.d.b). All Speak Up materials are available in English and Spanish and can be translated into other languages; they are available for use without copyright or reprinting permissions.

AIMS OF TEACHING AND COUNSELING

Patient education is the "process of assisting people to learn health-related behaviors that they can incorporate into everyday life with the goal of achieving optimal health and independence in self-care" (Bastable, 2019, p. 15), influencing the patient's behavior to effect changes in knowledge, attitudes, and skills needed to maintain and improve health. Research supports the fact that educated patients experience better health and have fewer complications. This results in fewer hospitalizations and emergency department, clinic, and health care provider visits. To be successful, patient education must be ongoing and interactive. It must also take into account the patient's plan of care, educational level, need for care no matter what the setting or environment, and other **social determinants of health**. Patient education plans should be developed with the patient in collaboration with the entire health care team, including, for example, physicians, dietitians, respiratory therapists, social workers, pharmacists, community-based care providers, wellness facilities, and long-term care facilities.

QSEN Reflective Practice: Cultivating QSEN Competencies

CHALLENGE TO ETHICAL AND LEGAL SKILLS

It was during my senior practicum in pediatrics last spring that I met Alicia Bonet, the young mother of a baby boy for whom I was caring. The baby's health care provider was recommending long-term aspirin therapy (unfortunately, I cannot remember what condition the child had for which long-term aspirin therapy was being recommended). Ms. Bonet was quite concerned about agreeing to aspirin therapy, asking me if I knew much about Reye syndrome. Then she asked me what I would recommend about whether or not to agree to long-term aspirin therapy. Not really understanding the risks versus the benefits of aspirin therapy or how it actually ties into Reye syndrome, I did not feel competent to answer Ms. Bonet's questions, let alone make an educated recommendation to her.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Thinking Outside the Box: Possible Courses of Action

- Tell the mother that I could not be of help to her in making this decision because of my lack of knowledge about either topic.
- Inform her that I would have to ask other nurses and members of the health care team to explain both topics to me (due to my lack of knowledge) before I could give her my opinion.
- Be honest with the mother about my lack of knowledge about either aspirin therapy or Reye syndrome and offer to gather information from reputable sources for both of us so that we could discuss the topics.
- Provide her with information from the hospital library or the internet so that she could educate herself (but not for my education so that I could assist her in making her decision).
- Lie to the mother (or withhold the fact that I did not know much about aspirin therapy or Reye syndrome) and make an uneducated recommendation simply because I had the “authority” to do so.
- Ignore the mother’s request, pretending not to have time to discuss her questions, rather than admitting my own ignorance or taking the time to educate myself.

Evaluating a Good Outcome: How Do I Define Success?

- The mother’s needs are met. Not only does she receive a professional, educated, and competent recommendation, but she also is given the opportunity to make her own educated decisions by being given the information she needs.
- My intellectual competence is challenged and improved. I am able to admit a deficit in my knowledge and embrace the opportunity to improve it.
- The mother and patient benefit from my actions (or at least are not harmed) by the mother’s informed choice.
- The mother’s autonomy is encouraged—by providing her with all the necessary information, I enable her to make a healthy, educated decision.
- Quality care is provided to the patient and their family by competent professionals.
- The mother expresses an understanding of the information presented to her, feels comfortable asking additional questions, and makes an educated decision with which she is comfortable.

Personal Learning: Here’s to the Future!

After explaining to the mother that I was not very familiar with aspirin therapy or Reye syndrome, I first attempted to gather research information from the internet for her. However, because I did not have a password to access the internet from the nurse’s station, I could not obtain the research I needed on my own. My next step was to ask my preceptor how to gather data for the mother if I could not get it from the internet. She suggested calling down to the hospital library and asking them to put together an information packet that could be easily understood by a patient. I did this, and several hours later, the packet arrived on the floor. After flipping through it briefly, I was satisfied with its contents and delivered it to Ms. Bonet. While I wished I had had the time to read all the information myself so that I could sit down with the mother and discuss it in detail, the day had been particularly busy. The best I could do was to pass the information on to the mother and hope she would read it herself. She was very grateful that I went to the trouble of gathering so much information for her, and she did not seem at all annoyed or disappointed that I did not have time to sit down with her to review the material. I did let her know that she could feel free to ask me any questions after she read the material, but she never got a chance to read the packet before my shift ended (because her son had visitors). As a result, we never got around to discussing her concerns.

One of the things that I learned from this experience is that it is okay to admit to a patient that you do not have all the answers. Moreover, admitting this helps to allay any doubt that they may have about my intellect or abilities as a nurse. Admitting a lack of knowledge is not a weakness, but a strength, for half the battle is knowing what you do not know. If anything, my willingness to admit my lack of knowledge and eagerness to educate both myself and my patient (by doing research) helped inspire trust and faith in me by my patient. I also learned that sometimes doing the best we can is better than doing nothing at all, even if the best we can do is not very much. Although I really needed to be able to sit down with Ms. Bonet and review the research with her, simply providing her with the material was enough to enable her to make an informed decision on her own. That simple act most likely empowered her to be much more comfortable with her decision in the end.

Although this occurred only a few months ago, I feel safe saying that my professional intellectual skills are quite adequate now—actually, they were quite adequate back then, too. Not knowing everything in nursing is not a reflection of inadequate professional intellectual skills, because it is impossible to know everything in this field. The fact that I knew that my knowledge was lacking, but that I knew where to go to find an answer, tells me my professional intellectual skills are more than adequate.

Tracey Sara Miller, Georgetown University

QSEN SELF-REFLECTION ON QUALITY AND SAFETY COMPETENCIES DEVELOPING KNOWLEDGE, SKILLS, AND ATTITUDES FOR CONTINUOUS IMPROVEMENT

How do you think you would respond in a similar situation? Why? What does this tell you about yourself and about the adequacy of your skills for professional practice? What *knowledge, skills,* and *attitudes* do you need to develop to continuously improve quality and safety in a situation like the one experienced by this student nurse?

Patient-Centered Care: How did the nursing student's communication skills improve the nurse–patient relationship? Did her handling of this situation facilitate her ability to deliver effective care and treatment in other environments? What, if any, teaching and learning principles did the nursing student use?

Teamwork and Collaboration/Quality Improvement: How important are effective communication skills when collaborating with other team members and hospital staff? Are there other referrals or community resources that might prove helpful to Ms. Bonet regarding her questions about long-term aspirin use for her child?

Safety/Evidence-Based Practice: Is there anything else the nursing student could have done to facilitate a positive outcome? Do you agree with the criteria to evaluate a successful outcome? Did the nursing student meet the criteria? What evidence in nursing evidence for practice provides guidance to assist Ms. Bonet with effective decision making in this situation? If time had not been a factor and you were able to discuss the materials in the packet with the baby's mother, would that have been an opportunity to assess Ms. Bonet's understanding of the information provided?

Informatics: Can you identify essential information that should be documented in the child's electronic record regarding your efforts to communicate with the mother about the specific concerns she expressed? Do you think the self-confidence gained from dealing effectively with this situation improves your ability to respond to patient's questions and accurately document their concerns?

The basic purpose of teaching and counseling is to help patients and families develop the self-care abilities (knowledge, attitude, skills) they need to maximize their functioning and quality of life (or to have a dignified death). For example, a patient newly diagnosed with diabetes must (1) acquire knowledge about diabetes as a disease process and related medical management and self-care; (2) value health sufficiently to make certain lifestyle modifications (attitude); and (3) master certain skills, such as medication administration. When done effectively, teaching and counseling are powerful tools for helping patients achieve health goals. Teaching provides the knowledge that patients need to make informed health care decisions and to implement a plan of care. **Counseling** provides the resources and support that patients need to participate actively in self-care and to facilitate their coping with their circumstances.

Recall **Alicia Bonet**, the young mother worried about long-term aspirin therapy and Reye syndrome. By providing Ms. Bonet with information, the nurse enables her to reach a decision that is based on sound knowledge and one with which she is comfortable.

Maintaining and Promoting Health

Nurses can help patients value health and develop specific health practices that promote wellness. Health teaching related to health promotion is varied, and ranges from teaching passive exercises to a patient with left-sided paralysis, to designing a safe exercise program for a young athlete, to teaching cooking for good nutrition to a group of middle-school children.

Preventing Illness

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Educational intervention related to illness prevention, a major theme in health teaching and counseling, takes many forms. You can counsel women of childbearing age about health practices that promote optimal fetal development, teach parents how to make their home safe for a toddler, counsel people at high risk for heart disease, cancer, or communicable diseases, or explain preventive health screening to adults.

Restoring Health

Once a patient is ill, teaching and counseling focus on developing self-care practices that promote recovery. Pre- and postoperative teaching, sexual counseling for a patient recovering from a myocardial infarction, and lifestyle counseling for a patient with an ostomy are all examples of teaching and counseling directed at restoring health.

Consider **Rachel Blumenthal**, the wife of the patient who had suffered a myocardial infarction. She is concerned about his activity level. When developing an appropriate teaching plan, the nurse would need to assess Mr. and Mrs. Blumenthal's knowledge base before determining their actual learning needs. In addition, the nurse would need to consult with the patient's cardiologist to determine the patient's status and levels of activity that are safe in relation to his health status. These actions help to ensure that the teaching plan includes accurate information and is individualized to Mr. and Mrs. Blumenthal's needs.

Facilitating Coping

Developmental lifestyle changes and acute, chronic, and terminal illness all place demands on patients and families that may become overwhelming. As a nurse, you will work not only with patients but also with their families and friends to help them adjust to changes in health status and whatever lifestyle modifications may be required. Not all patients fully recover from their illness or injury; many patients will need to learn to adapt and cope with short-term, long-term, or permanent health alterations.

Promoting Outcomes

Nurses who are skilled teachers and counselors work to promote the following outcomes:

- An optimal level of wellness and related self-care practices
- Disease prevention or early detection
- Quick recovery from trauma or illness with minimal or no complications
- Enhanced ability to cope with developmental lifestyle changes and acute and chronic health conditions, and/or terminal illness

Potential topics for health teaching and counseling are identified in Box 9-1.

Remember **Marco García Ramírez**, the father-to-be described in the beginning of the chapter. Pregnancy and childbirth are associated with developmental lifestyle changes. The nurse needs to incorporate knowledge of these changes when working with the couple to develop an appropriate teaching plan for Mr. García Ramírez and his wife. The goal of teaching would be a positive adaptation to their new role as parents.

Box 9-1	Topics for Health Teaching and Counseling

Promoting Health

- Developmental and maturational issues
- Normal childbearing
- Hygiene
- Nutrition
- Exercise
- Mental health
- Spiritual health

Preventing Illness

- First aid
- Safety
- Immunizations
- Screening
- Identification and management of risk factors

Restoring Health

- Orientation to treatment center and staff
- Patients' and nurses' expectations of one another
- The illness and physical condition: anatomy and physiology, etiology of problem, significance of symptoms, prognosis
- The nursing and other health care regimens and how the patient can participate in care
- Self-care practices the patient and family/caregivers need to manage the patient's condition independently

Facilitating Coping

- How the patient's physical and mental condition affects other areas of functioning; lifestyle counseling
- Measures that maximize independence and enhance self-concept
- Stress management
- Environmental alterations
- Community resources
- Appropriate referrals (e.g., physical therapy, occupational therapy, self-help groups, psychiatric–mental health counselor)
- Grief and bereavement counseling

NURSE AS TEACHER

Teaching is a planned method or series of methods used to help someone learn. The person using these methods is the teacher. **Learning** is the process by which a person acquires or increases knowledge or changes behavior in a measurable way as a result of the experience. You assume the role of teacher and your patient assumes the role of learner when there are identified learning needs. This teacher–learner relationship is enhanced by the therapeutic nurse–patient relationship, in which mutual respect and trust are established (see Chapter 8). You build on this trust by sharing information that you and your patient mutually identify as important.

Think back to **Alicia Bonet**, the young mother with questions about long-term aspirin therapy. The nurse developed trust with Ms. Bonet by honestly identifying that she lacked the necessary knowledge about the therapy. The nurse promoted an ongoing therapeutic relationship by seeking the information, thereby solidifying trust.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

The patient may ask for information, or you may initiate teaching after assessing and diagnosing/identifying a learning need. Key concepts that are important to consider in regard to patient education include the following (Lowenstein et al., 2009):

- Listen to your patients and their families
- Every interaction is an opportunity to teach
- Keep education patient (person) centered
- Begin teaching at the first patient encounter
- Engage and motivate

Like other clinical interventions, effective patient teaching demands analytic and problem-solving skills. To maximize the effectiveness of patient teaching, remember the acronym TEACH:

T: Tune into the patient
E: Edit patient information
A: Act on every teaching moment
C: Clarify often
H: Honor the patient as a partner in the education process

Learning to be an effective teacher is a critical component of professional development. A basic understanding of the teaching–learning process helps you develop your own teaching and learning skills. The process of patient teaching, which resembles the nursing process, consists of several steps that are necessary to provide teaching and to measure learning (refer to Box 9-2). This process is often condensed because of limited time or resources, but the basic principles apply each time the teaching–learning process occurs. Being a successful teacher requires excellent communication skills and sensitivity to all the factors that affect the patient's ability to learn (Fig. 9-1).

Box 9-2 Steps of the Teaching–Learning Process

Assess Learning Needs and Learning Readiness

1. Use all appropriate sources of information. Collaborate with the patient and family/caregivers.
2. Identify the knowledge, attitudes, or skills needed by the patient and family/caregivers.
3. Assess the patient's emotional and experiential readiness to learn.
4. Assess factors affecting the patient's ability to learn, including age and development level, family/caregiver support networks and financial resources, cultural influences, literacy, and language barriers.
5. Develop critical pathways or teaching plans that span care delivery settings from hospital to home to take advantage of optimal learning readiness.
6. Identify the patient's strengths.
7. Use anticipatory guidance.

Identify the Patient's Learning Needs

1. Be realistic.
2. Collaborate and validate with patient or family/caregivers through conversations, questionnaires, and checklists.

Develop Learning Outcomes

1. Identify specific, attainable, measurable, short-term and/or long-term outcomes for patient learning.
2. Make sure that proposed behavioral changes are realistic and explored in the context of the patient's resources and lifestyle.
3. Decide which domain of learning is involved (cognitive, psychomotor, affective).
4. Prioritize.
5. Collaborate with the patient and family/caregivers. Valuing of the outcomes increases likelihood of learning success.

Develop a Teaching Plan

1. Select content, content sequencing, and appropriate teaching strategies/activities.
2. Relate the teaching content to the patient's learning style, interests, resources, and patterns of everyday living.
3. Pay careful attention to time constraints, scheduling, and the physical environment.
4. Decide on group versus individual teaching and formal versus informal methodologies.

5. Formulate a verbal or written contract with the patient.

Implement Teaching Plan and Strategies

1. Prepare the physical or online environment, with attention to comfort and privacy.
2. Communicate effectively with individuals; small groups; and, in some instances, large groups.
3. Gather all materials and equipment.
4. Deliver the content in an organized manner using the selected teaching strategies.
5. Be flexible.
6. Keep teaching sessions short.
7. Vary strategies for sensory stimulation, which promotes learning.
8. Relate the material to the patients' life experiences, which will help them assimilate new knowledge.
9. Plan how you will evaluate learning.
0. Assess verbal and nonverbal feedback.

Evaluate Learning

1. Evaluate whether the learner outcomes were met:
   - Observe a return demonstration
   - Ask the patient to restate the instructions
   - Ask the patient questions to determine whether teaching reinforcement is needed
   - Use written test or questionnaires
   - Consult with the patient's family/caregivers
   - Consider patient feedback and comments
2. Reinforce and celebrate learning.
3. Evaluate teaching:
   - Self-evaluation
   - Patient questionnaires
4. Revise the plan if the learner outcome is not met:
   - Alter content and teaching strategies
   - Use motivational counseling
   - Reschedule teaching sessions
5. Document the teaching–learning process:
   - Patient and family learning needs and identified barriers to learning
   - Mechanisms used to overcome learning barriers
   - Patient and family/caregiver readiness to learn
   - Current knowledge regarding the patient's condition and health status
   - Learning outcomes agreed on by the nurse, patient, and family/caregiver
   - Identification of learning outcomes
   - Information and skills taught
   - Teaching methods used
   - Patient and family/caregiver response
   - Evaluation of what patient and family/caregivers learned and need for follow-up

Factors Affecting Patient Learning

By taking into consideration the patient's age and developmental level, and the impact of social determinants of health, including family support networks and financial resources, cultural influences and language limitations, and health literacy level, you can individualize the teaching plan and maximize learning. This will support the nursing goal of helping the patient to manage their own health care needs.

FIGURE 9-1. Effective communication is essential to the teaching–learning process. (*Source: Photo by Monkey Business Images/Shutterstock.*)

Age and Developmental Level

People learn throughout life, although what they learn and how learning occurs change according to developmental stages. Three critical developmental areas to consider when developing a teaching plan are the patient's physical maturation and abilities, psychosocial development, and cognitive capacity. Other concerns related to the teaching–learning process include the patient's emotional maturity and moral and spiritual development.

CHILD AND ADOLESCENT LEARNERS

Piaget's theory of intellectual development is a major learning theory (see Chapter 22). If you understand how children and adolescents develop learning abilities, you can use this knowledge when teaching patients.

When the patient is an infant, teaching is directed toward the parents. Toddlers and preschoolers may have some degree of understanding about medical tests or procedures, but health teaching continues to be directed toward the parents. For patients in this age range, it helps for one nurse to establish a relationship with the patient and family/caregivers and to be consistently involved in patient-teaching activities.

An example of teaching considerations for young children would be the case of a 4-year-old girl diagnosed with diabetes: The child must begin to take insulin every day, and the nurse should recognize the child's limitations in understanding diabetes. Information should be simplified to include only the most basic facts, with concrete examples or demonstrations; a detailed discussion of the pathophysiology of diabetes would not be appropriate. The girl could be told that she needs a shot every day to keep her from getting sick or feeling "funny." She could be allowed to play with the syringes and to give shots to a doll.

Children today, even at very young ages, have likely been exposed to online games with colorful animations that teach basic information. Their manual dexterity skills may be more advanced, and they may be more comfortable with tasks previously viewed as challenging for this age group. Preschool children are often eager to demonstrate a skill they have been taught and may ask many questions. Explanations should be short and composed of simple words. Compared to adults, children have shorter attention spans and a greater need for nurturing, support, and creative participation in learning activities.

School-aged children are capable of logical reasoning and should be included in the teaching–learning process whenever possible. Teaching strategies that include clear explanations and reasons for procedures, stated in a simple and logical manner, are most successful. These children are open to new learning experiences but need learning to be reinforced by either a parent or health care personnel as they become more involved with their friends and school activities.

The cognitive processes of adolescents are similar to those of adults; thus, the content and strategies of patient teaching for this age group resemble those used for teaching adults. There are some important considerations to keep in mind, however. For example, when teaching a sexually active 16-year-old girl about contraceptive methods, you would assess whether the young patient has reached the stage Piaget refers to as formal operations (the ability to use logical reasoning to solve hypothetical problems). If the patient's intellectual development is delayed and she is still in the period of concrete operations (use of logical reasoning to solve concrete problems), she may be less skilled in thinking abstractly—that is, she may not perceive pregnancy as a real possibility, and therefore may not fully understand the need for contraception. If so, you can alter the teaching plan to include online teaching aids that are easily accessible and explain the topic in concrete terms. Peer group acceptance is critical for most adolescents. Teaching strategies designed for an adolescent patient should recognize the adolescent's need for independence and the need to establish a trusting relationship that demonstrates respect for the adolescent's opinions.

Motor development is also a concern in the teaching–learning process. A 4-year-old girl diagnosed with diabetes may not be able to administer her own insulin shots if she lacks the fine motor skills needed to manipulate the equipment, but a 13-year-old patient could probably master the technique quickly.

ADULT LEARNERS

As people age, their personalities and learning abilities change. Most psychologists who have studied the teaching–learning process base their work on children and adolescents, because a large amount of learning occurs early in life. The science of teaching (**pedagogy**) generally refers to the teaching of children and adolescents. In recent years, the study of teaching adults (**andragogy**), beginning at young adulthood, 20 to 40 years of age, has gained more attention (Knowles, 1990).

Adults need to be taught differently than children. Knowles (1990) listed the following four assumptions about adult learners:

- As people mature, their self-concept is likely to move from dependence to independence.
- The previous experience of the adult is a rich resource for learning.
- An adult's readiness to learn is often related to a developmental task or a social role.
- Most adults' orientation to learning is that material should be useful immediately, rather than at some time in the future.

Thus, andragogy focuses on a specific problem or need and on the immediate application of new material. In general, adult learners must believe that they need to learn before they become willing to learn. Nurses often must use their counseling skills (discussed later) to motivate patients to participate in the teaching–learning process. Adults may need to be shown the importance of learning new information, health practices, or skills.

Because health promotion and injury avoidance are important activities throughout the lifespan, teaching methods need to be further modified when working with older adults. When developing a teaching plan for older adults, first identify any learning barriers such as sensory loss, limited physical mobility, or inability to comply with the recommended therapeutic regimen. Sensory deficits that can affect learning in older adults include the presence of cataracts that can cloud vision and a decrease in lens accommodation that necessitates adequate lighting and high contrast, larger font printed materials; a decrease in peripheral vision that requires that teaching materials be kept immediately in front of the learner; or a hearing loss that make it imperative for the teacher to speak slowly and clearly (CDC, 2019; Eliopoulos, 2018). Successful teaching plans for older adults incorporate extra time, short teaching sessions, accommodation for sensory deficits, and reduction of environmental distractions. Older adults also benefit from instruction that relates new information to familiar activities or information.

Family/Caregiver Support Networks and Financial Resources

No matter what the patient's age, working with the patient's family/caregivers can be a great help in patient teaching. Assess the family's/caregiver's role and style by talking with them and observing how the patient and family interact. This assessment will yield information about family/caregiver function, stress, transitions, and expectations. Informal conversations with both the patient and family/caregivers can provide data that will help in developing the teaching plan. The COPE model (Houts et al., 1996) described in Box 9-3 is one method of helping family members/caregivers become effective problem solvers and support your teaching efforts.

Family caregiving—providing care for a family member, partner, or friend with a chronic, disabling, or serious health condition—is nearly universal today (National Alliance for Caregiving [NAC] & American Association of Retired Persons [AARP], 2020). In 2020, it was estimated that about 53 million family caregivers in the United States provided unpaid care to an adult family member or friend, or child with limitations due to health or functional needs (NAC & AARP, p. 4). In addition, compared to data from 2015, a greater proportion of caregivers of adults are providing care to multiple people, with 24% caring for two or more recipients (up from 18%) (NAC & AARP, p. 4). This family caregiver also often provides support when the patient is hospitalized. It is important to identify and provide education related to the learning needs of caregivers and provide meaningful supports for family caregivers. Family caregivers should be involved in collaboration with health care team members regarding care planning. Family caregivers should be viewed as partners in providing care, and you should view yourself as a health educator who teaches patients and their families/caregivers how to solve problems rather than as an expert meant to solve problems for them. Refer to the accompanying Research in Nursing box for a review of a quality improvement project that provides evidence for practice to improve patient outcomes through improved education of caregivers of patients with cognitive impairment.

Box 9-3 **COPE Model**

C: Creativity

Help the family overcome obstacles to carrying out health care management and learning how to generate alternatives.

O: Optimism

Help the family caregivers learn how to view the caregiving situation with confidence.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

P: Planning

Help the family learn how to plan for future problems and how to develop contingency plans that reduce uncertainty.

E: Expert Information

Help the family learn how to obtain expert information from health care providers about what to do in specific situations. This information empowers caregivers by encouraging them to develop plans for solving caregiving problems.

Source: Adapted from American Psychological Association (APA). (2011). *Creativity, optimism, planning and expert information (COPE)*. https://www.apa.org/pi/about/publications/caregivers/practice-settings/intervention/cope; Houts, P. S., Nezu, A. M., Nezu, C. M., & Bucher, J. A. (1996). The prepared family caregiver: A problem-solving approach to family caregiver education. *Patient Education & Counseling*, *27*(1), 63–73.

The patient's and family's/caregiver's financial resources should be evaluated. The patient and/or their family/caregivers may be unable to afford to follow a new treatment regimen or other parts of the proposed plan of care. The patient's and family's/caregiver's financial resources must be taken into consideration by the health care team when planning care. If needed, refer patients and families to community-based support groups and funding sources.

Research in Nursing

BRIDGING THE GAP TO EVIDENCE-BASED PRACTICE

Educational Needs of Family Caregivers

Family caregivers are partners in the provision of patient care and require appropriate education and meaningful support. Nurses need to identify the educational needs of patients and family caregivers to provide effective health education, supporting informed decisions about health care. Well-informed caregivers are a critical component of the care for many patients.

Related Research

Agarwal, K. S., Bhimarij, A., Xu, J., Bionat, S., Pudlo, M., Miranda, D., Campbell, C., & Taffet, G. E. (2020). Decreasing heart failure readmissions among older patients with cognitive impairment by engaging caregivers. *The Journal of Cardiovascular Nursing, 35*(3), 253–261. https://doi.org/10.1097/JCN.0000000000000670

This quality improvement project examined the impact of caregiver inclusion in nursing discharge patient education on readmission in older adults with cognitive impairment and heart failure. Patients age 70 years or older discharged from hospital heart failure (HF) units with a primary diagnosis of HF were screened for cognitive impairment using Mini-Cog testing. If the patient's Mini-Cog score was less than 4 (indicating cognitive impairment), the patient's caregivers were included in an enhanced nursing discharge education and planning program. Readmission within 30 days to any of the hospital-system facilities was tracked. In patients with cognitive impairment, involving caregivers in nursing discharge teaching was associated with decreased 30-day readmission (P = .01). The researchers concluded involving caregivers in discharge education is an important intervention to reduce readmission rates for older patients with cognitive impairment and HF.

Relevance to Nursing Practice

Many family caregivers lack experience in carrying out this role and need the best possible assistance to maintain their role and provide support to their family member. Nurses have the ability to empower caregivers by providing instruction and counseling to assist them to identify and implement strategies to provide care, learn the practical skills required for their particular situation, what to expect related to progression of illness and prevent complications.

Cultural Influences and Language Differences

As our society becomes more ethnically diverse, you will be providing care and education to patients from many different cultural and ethnic backgrounds. Different cultural backgrounds create different attitudes and reactions to changes in health and can influence how people express themselves (Bastable, 2019). A thorough assessment is essential prior to establishing a plan of action and educational outcomes (Bastable, 2017; Schaffler et al., 2019).

It is important to keep in mind that culture can also influence how people express themselves verbally and nonverbally (Bastable, 2017). In addition, be sure to identify language differences or barriers and develop strategies to address them, clearly communicating this in the plan of care. Do not assume that a family member/caregiver is adequately translating information critical to the patient's learning. The Joint Commission standards and accreditation requirements include an expectation for hospitals to accommodate the oral and written communication needs of all patients (The Joint Commission, 2011). This includes translated, clearly stated patient education information.

To successfully provide care, you may need to seek information from a variety of sources, such as the nursing literature and evidence for practice and books that describe the health practices and values of other cultures. Numerous

resources provide assistance in meeting patient education needs for culturally and ethnically diverse populations. Professionally trained interpreters should be used for assessment, teaching, and other important interactions (Bastable, 2019; Gutman et al., 2018). Telephone interpreting services and translation software apps are possible services to be used if an interpreter is not available in-person. Patient education specialists from four health systems in central Ohio offer free, easy-to-read, copyrighted health information on more than 300 topics in multiple languages on the Health Information Translations (n.d.) website (healthinfotranslations.org). The National Library of Medicine, through the website Medline Plus, provides patient education materials in multiple languages that include tutorials with animated graphic materials and accompanying handouts (U.S. National Library of Medicine, 2020). The National Library of Medicine provides additional patient materials through HealthReach, a national collaborative partnership that has created a resource of quality multilingual, multicultural public health information (U.S. National Library of Medicine, n.d.). Box 9-4 outlines strategies for providing patient education in a culturally considerate manner.

Box 9-4 Culturally Considerate Patient Teaching

- Develop an understanding of the patient's culture.
- Work with a multicultural team in developing educational programs.
- Be aware of personal assumptions, biases, and prejudices.
- Understand the core cultural values of the patient or group. Listen to the patient and family/caregivers. Explore customs or taboos (Bastable, 2019).
- Understand the patient's religious practices and determine how their beliefs influence perceptions of health and health care (Bastable, 2019).
- Develop written materials in the patient's preferred language.

Health Literacy

Health literacy is the ability to access, read, understand, evaluate, communicate, and act on health information to promote, maintain, and improve health; health literacy is associated with the capacity and self-efficacy to manage health and well-being (Okan, 2019). More than a quarter of U.S. adults (approximately 80 million people) have limited health literacy and thus would have difficulty with common health tasks (AHRQ, 2011). Health literacy has been found to strongly correlate with many of the social determinants of health, contributing to disparities in health (Mantwill & Divani, 2019). Health literacy requires a complex group of reading, listening, and analytical and decision-making skills and the ability to apply these skills to health situations (Network of the National Library of Medicine [NNLM], n.d.a). These skills include, for example, accessing health care services, interpreting test results, analyzing relative risks and benefits, locating health information, reading health prevention pamphlets, measuring medication doses, and understanding and complying with verbal or written health care instructions (NNLM, n.d.a). Limited health literacy affects adults in all racial, ethnic, age, education, and income groups; however, the older adult and immigrant populations, those with limited education, those with low incomes, minority populations, and non-native speakers of English are most likely to experience low health literacy (NNLM, n.d.a; USDHHS, 2010).

Federal initiatives such as the Affordable Care Act of 2010 and the National Action Plan to Improve Health Literacy from USDHHS (2010) have made health literacy a national priority to improve the health of all Americans. Awareness of the health literacy issue gives health care professionals the opportunity to support patients and families in overcoming barriers to health, including addressing social determinants of health, and empowering patients to take control of their health care needs (Office of Disease Prevention and Health Promotion, 2020b; USDHHS, 2010).

Nurses need to identify patients and family caregivers with limited health literacy for health education to be effective (Eadie, 2014). The Newest Vital Sign (NVS) is a screening tool to identify patients at risk for low health literacy. It was developed by Pfizer to improve communications between patients and providers and can be administered during initial assessments to assess the patient's literacy skills involving both numbers and words (Pfizer, n.d.). The NVS has been reported to perform moderately well in identifying limited literacy (Brangan et al., 2018; Pfizer, n.d.; Powers et al., 2010). The NVS uses a nutrition label from an ice cream container (Fig. 9-2) and a score sheet for recording the patient's answers to six oral questions that refer to the label (Fig. 9-3 on page 220). Based on the number of correct responses, the health care provider can then further assess the patient's health literacy level as indicated. The time spent administering this tool more than compensates for the time providers might need clarifying a diagnosis, treatment, or medications if they had not recognized a patient's limited health literacy.

The *Ask Me 3®* is another intervention to address health literacy by promoting understanding and improving communication between patients and their providers (Institute for Healthcare Improvement [IHI], n.d.). It is an educational program that encourages patients and families to ask three specific questions of their providers to better understand their health conditions and what they need to do to stay healthy (IHI, n.d.). Providers are encouraged to answer these questions in a clear, forthright manner. The *Ask Me 3®* questions are:

- What is my main problem?
- What do I need to do?

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

- Why is it important for me to do this?

The health care provider's response should include plain language without medical jargon, may incorporate the use of visual models to explain a disease or procedure, and should include a teach-back demonstration that verifies their understanding of the information. The Teach-Back Method assesses health literacy, seeking to confirm that the learner understands the health information received from the health professional (Agency for Healthcare Research and Quality [AHRQ], 2017). It is a particularly important intervention when a person has difficulty reading and comprehending written materials or has limited English proficiency. Patients and family/caregivers have the opportunity to repeat back to the health care provider the key points they understand from a teaching session. The health care provider should speak slowly and clearly and focus on the most important concepts, stopping at intervals to check the patient's and family's/caregiver's understanding by asking the patient or family member/caregiver to teach it back—asking them to explain in their own words what they need to know or do (AHRQ, n.d.). Clarification and repetition of information is provided as needed. The Teach-Back Method has been proven to be effective in a wide variety of patient care settings (Dinh et al., 2016; Nickles et al., 2020; Prochnow et al., 2018; Ryan-Madonna et al., 2019). See the accompanying Promoting Health Literacy display in this and other chapters throughout this book for examples of implementation of this program in action.

Collaboration between health care providers and patients to achieve effective health education is dependent upon accurate communication. Both the nurse and patient need to be part of setting goals and objectives to support success (Bastable, 2017). Strategies to enhance health literacy should be learner centered (Bastable, 2017). All patients, regardless of literacy level, need and should receive accessible and actionable health information to make informed decisions about their health (Duncan, 2020). Nurses must be knowledgeable about the prevalence of low health literacy and its impact on patients and make a concentrated effort to be well informed about effective strategies for health care communication (Scott, 2016).

Promoting Health Literacy

IN PATIENTS WHO SMOKE

Patient Scenario

Jack Boyer is 37 years old and has been smoking since he was 17 years of age. During a routine health visit, he admits to a one pack per day habit. In response to a question from his health care provider, Jack

admits that several previous attempts to stop smoking failed after a day or two. He states on his history form that he is married and has two sons, 7 and 3 years of age, and also lists that his father died following a heart attack at the age of 60. Jack tells his health care provider that he is essentially healthy but is under a lot of stress. Because of the downturn in the economy, his job in automotive sales is at risk. His wife works full-time as an administrative assistant. The health care provider expresses concern to Jack about the effects of second-hand smoke on his family. Jack states, “I know all about that and when I smoke in the car, I keep the window down and blow the smoke outside. At home, I try to smoke outside most of the time except when the weather is bad.” The physical examination reveals that Jack has hypertension (BP 164/92), is 15 lb overweight, and is currently having difficulty sleeping. The health care provider explains that he would like to monitor Jack’s blood pressure for 1 month before prescribing antihypertensive medication. He recommends that Jack make a serious effort to stop smoking and reviews the harmful effects of nicotine use and the long-term benefits for Jack as well as his family, if he stops smoking. The health care provider explains that the nurse will discuss information about quitting smoking when he makes an appointment for his next visit. As Jack is speaking with the nurse, he comments that maybe he’ll switch to chewing tobacco since there’s no smoke involved with that.

Nursing Considerations: *Tips for Improving Health Literacy*

Provide Jack with information about ways to help him quit smoking. Mention that counseling and behavior cessation therapies have proven effective and that often it takes repeated attempts to quit. Jack needs to understand the harmful effects of second-hand smoke on his family, as well as the fact that people who stop smoking greatly reduce their risk of lung cancer, heart disease, and respiratory symptoms. Explain to him that smokeless tobacco is also a significant health risk and not a safe substitute for smoking cigarettes. Give him information about nicotine replacement products (gum, inhalers, patches) found effective in treating tobacco dependence. Several non-nicotine medications are also available but need to be prescribed by his health care provider. For extra help, suggest he call 1-800-QUIT-NOW, which connects callers with counselors who are trained specifically to help smokers quit (National Cancer Institute, n.d.). When Jack returns for his follow-up appointment, he needs to be prepared to ask his health care provider the following questions to help him understand that tobacco addiction is a chronic condition and what the positive outcomes of quitting will be:

- What is my main problem?
- What do I need to do?
- Why is it important for me to do this?

What additional measures can you take to help increase health literacy in this patient? What other measures would be helpful if Jack did not speak English, could not read, or had other factors that could affect his health literacy?

The Newest Vital Sign

Score Sheet for the Newest Vital Sign Questions and Answers

READ TO SUBJECT:
This information is on the back of a container of a pint of ice cream.

1. If you eat the entire container, how many calories will you eat?
   Answer: *1,000 is the only correct answer*

2. If you are allowed to eat 60 g of carbohydrates as a snack, how much ice cream could you have?
   Answer: *Any of the following is correct: 1 cup (or any amount up to 1 cup), half the container. Note: If patient answers "two servings," ask "How much ice cream would that be if you were to measure it into a bowl?"*

3. Your doctor advises you to reduce the amount of saturated fat in your diet. You usually have 42 g of saturated fat each day, which includes one serving of ice cream. If you stop eating ice cream, how many grams of saturated fat would you be consuming each day?
   Answer: *33 is the only correct answer*

4. If you usually eat 2,500 calories in a day, what percentage of your daily value of calories will you be eating if you eat one serving?
   Answer: *10% is the only correct answer*

READ TO SUBJECT:
Pretend that you are allergic to the following substances: penicillin, peanuts, latex gloves, and bee stings.

5. Is it safe for you to eat this ice cream?
   Answer: *No*

6. Ask only if the patient responds "no" to question 5: Why not?
   Answer: *Because it has peanut oil*

	ANSWER CORRECT? Yes	No
Number of correct answers:		

Interpretation

Score of 0–1 suggests high likelihood (50% or more) of limited literacy.
Score of 2–3 indicates the possibility of limited literacy.
Score of 4–6 almost always indicates adequate literacy.

FIGURE 9-3. Score sheet for the Newest Vital Sign (NVS) includes questions and answers that refer to the label. (*Source:* From Pfizer Inc. [n.d.]. *Health literacy. Public policy researchers. The Newest Vital Sign [NVS]*. https://www.pfizer.com/health/literacy/public-policy-researchers/nvs-toolkit. Reprinted with permission from Pfizer Inc.)

Learning Domains

People learn in three domains: cognitive, psychomotor, and affective (Bloom, 1956). The ability of patients to manage their daily lives and maintain or resume their former roles depends on the extent to which their cognitive, psychomotor, and affective learning result in behavioral changes. These domains influence the nurse's selection of teaching and evaluation strategies. Effective teaching often involves the promotion of behaviors in all three domains.

Cognitive learning involves the storing and recalling of new knowledge in the brain (e.g., the patient describes how salt intake affects blood pressure). Cognitive learning includes intellectual behaviors such as the acquisition of knowledge, comprehension, application (using abstract ideas in concrete situations), analysis (relating ideas in an organized way), synthesis (assimilating parts of information as a whole), and evaluation (judging the worth of a body of information). Learning a physical skill involving the integration of mental and muscular activity is called **psychomotor learning** (e.g., the patient demonstrates how to change dressings using clean technique). **Affective learning** includes changes in attitudes, values, and feelings (e.g., the patient expresses renewed self-confidence after physical therapy).

Recall **Marco García Ramírez**, the father-to-be with concerns about his new role. The nurse would develop a teaching plan that focuses on the three domains of learning. The nurse would address the cognitive domain by teaching Mr. García Ramírez and his wife about labor and delivery, including the labor process and what events will occur. Teaching the couple about newborn care and breathing techniques to use during labor would address the psychomotor domain. Learning in the affective domain would be demonstrated if Mr. García Ramírez reports that he and his wife do not fear labor and feel comfortable handling a newborn.

Effective Communication Techniques

A critical component of effective patient education is the nurse's ability to be an effective communicator. Professional communication is discussed in detail in Chapter 8. Key points of effective communication associated with patient teaching include the following:

- Be sincere and honest; show genuine interest and respect.
- Avoid giving too much detail; stick to the basics.
- Ask if the patient has any questions.
- Be a "cheerleader" for the patient. Avoid lecturing.
- Use simple words.
- Vary your tone of voice.
- Keep the content clear and concise.
- Listen and do not interrupt when the patient speaks.
- Ensure that the environment is conducive to learning and free of interruptions.
- Be sensitive to the timing of teaching sessions. A shorter session is best for a younger child, and an adult may need to choose an opportune time to learn new information.

NURSING PROCESS FOR PATIENT AND FAMILY/CAREGIVER TEACHING

Patient teaching is approached most effectively using the steps of the nursing process. The teaching–learning process and the nursing process are interdependent. Health care providers have a responsibility to identify the patient's learning needs and determine their readiness to learn (Bastable, 2017).

Assessing

Usually, patients themselves are the best source of assessment information. Patients are considered primary sources of information. By using effective interviewing techniques (see Chapter 8), you can obtain the data needed to identify learning needs. An important component is assessing what the patient wants to learn; motivation to learn is increased by focusing on what the patient feels is most important to know or to be able to do (Bastable, 2017). In addition, relevant information may be obtained before actually meeting the patient by reviewing the patient's past and current health records. These records are considered secondary sources of information and can provide a history of health problems as well as documentation of the nursing assessments, diagnoses/patient problems, nursing physical examinations, and nursing interventions that have been performed.

QSEN PATIENT-CENTERED CARE

Partner with the patient and family/caregivers to determine what they consider to be important and what they identify as the best educational outcomes. Ask the patient and family/caregivers what they need and care most about.

The patient's family/caregivers and significant others are also valuable sources of assessment data. They are sometimes needed to provide assessment data when the patient cannot communicate because of health problems,

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

language barriers, or impaired sensory functions. At other times, family members/caregivers or significant others may be the most appropriate source of certain information; for example, if seeking information about how much salt is used in the family's cooking, you could speak with the person who prepares the meals at home and include that person in any teaching about food preparation. The patient's permission is needed before family members/caregivers are involved in the teaching–learning process.

In addition to identifying the patient's learning needs, you should assess your own knowledge base and teaching skills. Nurses cannot teach information and skills to patients if they themselves lack the information and skills to be taught. Often, knowing where to find information or an appropriate resource person is the first step in correcting your knowledge deficits.

Assessment of the Learner

Assessment of the learner is the first and most important step in the teaching–learning process (Bastable, 2019). Four elements should be considered in each assessment of the learner. First, identify **learning needs**, gaps in knowledge that exist between what the person knows and what someone needs or wants to know (Bastable, 2019). Gaps may be a result of a lack of knowledge, attitude, or skill (Holli & Beto, 2018). Assessment through structured interviews, informal conversations, questionnaires and/or observation, for example, will reveal what the patient considers of importance to learn. The nurse then considers new knowledge, attitudes, or skills necessary for patients and families to learn in order to manage their health care, based on the individual patient's health problems.

Assess **learning readiness**. The patient's anxiety, motivation for learning, willingness to engage in the teaching–learning process, and support system contribute to readiness to learn. Readiness is distinguished from the patient's actual ability to learn, which is the third element. Assess the patient's **learning style(s)**. A person's learning style is the individual preferences for and abilities to process content of various instructional messages (Holli & Beto, 2018). These preferences influence how easy or difficult learning is for the individual and impact teaching and learning interventions. The fourth element of assessment is of the patient's **learning strengths**. Strengths are the personal resources that can be harnessed to facilitate the teaching–learning process. Box 9-5 (on page 222) provides additional information related to these assessment parameters. Additional factors to consider in assessment of the learner include motivation and adherence.

Motivation

When assessing a patient's learning readiness, consider the patient's motivation. Patients who are ready to learn are able and motivated to process new information, develop new skills, and explore new attitudes and behaviors. Motivation is an internal impulse (such as emotion or physical pain) that encourages the patient to take action or change behavior.

Think back to **Rachel Blumenthal**, the wife of the patient who had a myocardial infarction. Although further assessment is necessary, analysis of Mrs. Blumenthal's questions would lead the nurse to suspect that she is interested in finding out information, because she is showing motivation and a beginning readiness to learn.

A patient's health beliefs can have great influence on motivation. The health belief model identifies several health beliefs as critical for patient motivation (Rosenstock, 1974). Motivation is enhanced when:

Box 9-5 Assessment Parameters

1. **Learning Needs**
   - Knowledge, skills, and attitudes that are of priority to the patient
   - New knowledge, skills, or attitudes that are necessary for patients and families to learn in order to manage their health care
2. **Learning Readiness**
   - Physical readiness

- Complexity of task
- Health status
- Physical abilities

3. **Emotional Readiness**
   - Emotional health
   - Motivation for learning
   - Self-concept and body image
   - Sense of responsibility for self
   - Support system
   - Developmental considerations
4. **Experiential Readiness**
   - Social and economic stability
   - Past coping mechanisms
   - Attitude toward learning
   - Cultural background
   - Literacy
   - Communication skills
5. **Learning Style**
   - Preferences in thinking and problem solving
   - Differences in processing information
   - Personality
   - Past experiences with learning
   - Comprehension, reasoning, memory, or psychomotor skills
   - Visual, tactile (kinesthetic), auditory learners
6. **Learning Strengths**
   - Past experiences with learning
   - High motivation
   - Strong network
   - Adequate financing

- Patients view themselves as susceptible to the health problem in question
- Patients view the health problem as a serious threat
- Patients believe there are actions they can take to reduce the probability of acquiring the health problem
- Patients believe the threat related to taking these actions is not as great as the health problem itself

The health belief model was designed to explain why people are willing to take actions to support their health, but it evolved into a strategy for predicting the likelihood that patients would adhere to therapies. Motivation plays a key role in the health belief model because it spurs the patient to behave in ways for health promotion and health protection. Examples of motivational triggers include personal crisis and loss of social role due to disease symptoms. You can use the health belief model when developing teaching plans, evaluating the ideas or beliefs that motivate a patient, and applying these to the teaching plan. For example, if you are able to modify a patient's perception of disease susceptibility, the patient might become more receptive to learning.

Adherence

The terms adherence and compliance are often used interchangeably to refer to a patient's efforts to follow health care advice (Robinson et al., 2008, as cited in Bastable, 2017, p. 158). Both terms refer to the ability to maintain health-promoting regimens determined by or in conjunction with the health care provider, respectively (Bastable, 2017). Compliance refers to the extent to which a patient's behavior coincides with the clinical advice, implying the health care provider is viewed as the authority and the patient passively follows recommendations, a paternalistic attitude toward patients (Bastable, 2017; Hugtenburg et al., 2013). **Adherence** refers to the extent to which a person's behavior corresponds with the agreed-upon recommendations from a health care provider as a result of a team approach to the treatment plan, in which the patient and health care provider are part of the team (Gardner, 2015; Sabaté, 2003, as cited in Bastable, 2017, p. 158). The term *adherence* supports a more inclusive and active patient role, emphasizing agreement between the patient and health care provider, and is seen as more patient (person) centered than compliance (Hurlow & Hensley, 2015; Vlasnik et al., 2005, as cited in Bastable, 2017, p. 159). Use of the term *adherence* reflects the patient's right to choose whether or not to follow treatment recommendations (Hurlow & Hensley, 2015). Therefore, the term adherence will be used in this discussion.

Nursing assessment of the patient's learning needs is vital to developing a plan of care with which the patient can adhere. Patients are considered to adhere when they follow the agreed-upon treatment plan and use the information they have learned. Accurate and thorough assessment of a patient's learning needs, motivation (as outlined above),

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

and current knowledge, behaviors, skills, and self-care activities provide insight into the patient's adherence to previous plans of care as well as information to help to develop new teaching plans that support adherence and address any nonadherence (Hugtenburg et al., 2013).

Nonadherence occurs when patients do not follow treatment recommendations that are mutually agreed upon (Resnick, 2005, as cited in Bastable, 2019). The terms nonadherence and noncompliance are also often used interchangeably; the term nonadherence is used in this discussion for continuity. Patients may ignore instructions or not follow them appropriately; nonadherence may also occur unintentionally (Bastable, 2017). Nonadherence may contribute to situations that threaten the patient's health. Nonadherence can be associated with a lack of learning readiness and motivation, confusion, disappointment, misunderstanding, fear, or inability to learn. Treatment factors such as side effects, lifestyle issues such as transportation, and sociodemographic factors such as inadequate finances may also contribute to nonadherence.

Patients control the choices they make about following the plan of care and using what they have been taught, but it is your responsibility as a nurse to help patients improve their health by sharing knowledge, solving problems, and providing support while the patient integrates the new knowledge and practices the new skills. When patients understand their health problem, treatment rationale, medication regimen, recommended plan of care, and the benefits of adherence, they are more likely to keep to the plan. Accurate understanding of the patient's situation, effective patient teaching, and tailoring of the plan to the patient contribute greatly to increasing the probability for patient adherence (Aronson, 2007; Mathew & Thukha, 2018). Health care providers should assist patients to be proactive and take an active part in their treatment to encourage positive behaviors and adherence (Makiling & Smart, 2020; Richie, 2016). Box 9-6 identifies ways to support patients and families in adhering to the plan of care.

Diagnosing Actual or Potential Health Problems and Needs

An assessment of the patient and family/caregivers may lead to the identification of one or more diagnoses or patient problems related to patient education—the knowledge, attitudes, or skills needed to support health promotion. Following the formulation of the diagnoses or patient problems, the nurse communicates findings to other nursing and health care professionals through the use of the written and spoken word. The written actual or potential health problem or need becomes a permanent part of the patient's health record. Examples of health problems and needs with related etiology and signs and symptoms can be found in the box titled Examples of Actual or Potential Health Problems and Needs: Patient Education.

Box 9-6 Promoting Patient and Family/Caregiver Adherence

- Be certain that health care instructions are understandable and designed to support patient goals.
- Include the patient and family/caregivers as partners in the teaching–learning process.
- Use interactive teaching strategies.
- Remember that teaching and learning are processes that rely on strong interpersonal relationships with patients and their families.

Outcome Identification and Planning

Planning for learning involves the development of a teaching plan. Teaching plans follow the steps of the teaching–learning and nurses' processes. One type of teaching plan is presented in Box 9-7 (on page 224). It is directed toward teaching appropriate nipple care to reduce the likelihood of nipple cracking and redness in breastfeeding women.

Examples of Actual or Potential Health Problems and Needs

PATIENT EDUCATION

Actual or Potential Health Problems and Needs	Possible Etiologic Factors	Potential Signs and Symptoms
		• Unable to choose clothing • Impaired ability to put on and remove clothing • Unable to use assistive devices • Decreased strength in right upper and lower extremities • Flaccid left upper extremity • Unable to identify procedure for insulin administration

Dressing ADL Deficit **Impaired Health Maintenance** **Knowledge Deficiency**	Extreme fatigue and weakness Insufficient understanding of diabetes treatment regimen Inaccurate follow-through related to fiber-rich diet for diverticular disease	• Inadequate identification of signs and symptoms of hypo- and hyperglycemia • Blood-glucose levels labile, ranging from 210 to 400 over past weeks • Dietary recall reveals excessive carbohydrate and sugar consumption “I thought I should never eat fiber again.” “I’ve been avoiding beans and vegetables.” Inaccurate identification of dietary regimen Unable to identify appropriate food choices Unable to verbalize rationale for fiber-rich diet. Dietary recall reveals lack of fiber-rich foods. Reports some “problems” with constipation; last stool 3 days ago.

Box 9-7	**Sample Teaching Plan**

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Actual or Potential Health Problems and Needs: Ineffective breastfeeding
Possible Etiologic Factors: Insufficient knowledge of nipple care
Potential Signs and Symptoms: Reports sore nipples, redness, cracking, pain when baby latches on; unable to verbalize appropriate nipple care
Long-Term Outcome: Patient will be able to breastfeed as long as desired without nipple problems

(Short-Term) Learner Outcome	Date Met	Content	Method/Material	Learner Activity
Patient describes measures to prevent nipple cracking (cognitive).	8/10/25 L.I.	Protective measures: • Avoid soap/alcohol/drying agents on nipples. • Pat nipples dry after bathing and keep dry.	Discussion Audiovisual: Flip chart on breastfeeding	Read handout: Nipple care. Review "Breastfeeding—skin and nipple changes." National Library of Medicine. (2018) http://www.nlm.nih.gov/medlineplus/ency/patientinstructions/000632.htm
Patient begins protective measures immediately (psychomotor).	8/10/25 L.I.	• Apply a thin layer of 100% highly purified anhydrous (HPA) lanolin on nipple. • Avoid use of nursing pads or bras that contain plastic.		Read handout: Sore nipples
Patient describes the correct procedure for breastfeeding (cognitive).	8/10/25 L.I.	• Discuss possible positions to use to hold and support the baby during breastfeeding. • Review available breastfeeding aids. • Start baby on less sore side.	Discussion Audiovisual: Flip chart on breastfeeding	Read handout: Positioning baby for breastfeeding. View "Breastfeeding and breast milk." National Institute of Child Health and Human Development (2017). https://www.nichd.nih.gov/health/topics/breastfeeding
Patient demonstrates correct procedure for breastfeeding (psychomotor).	8/10/25 L.I.	• Get baby onto areola area. • Position baby properly. • Change position for each feeding. • Remove baby from breast.	Discovery: Guide through each step; assist as necessary Return demonstration	
Patient displays increasing confidence in breastfeeding skills and self-care (affective).	8/10/25 L.I.	After feeding: • Air dry the nipples. • Inspect for open or cracked areas. • Apply lanolin.	Discovery	
Patient values good nutrition and hydration and rest at home (affective).	8/10/25 L.I.	Home considerations: • Maintain "demand feedings."	Lecture with discussion Audiovisual: Poster	Refer to handouts at home as needed; call maternity department's information number for any questions
Patient can list the signs of thrush (cognitive).	8/10/25 L.I.	• Ensure good nutrition. • Get adequate rest. • Know the signs and symptoms of thrush.		

Standardized teaching plans are available for major topics of health teaching. Such plans must be tailored to the patient's learning needs and abilities. Remember that factors such as age, developmental level, family/caregiver support networks, financial resources, cultural influences, language proficiency, and health literacy affect the patient's ability to learn and take them into consideration when individualizing the teaching plan. Incorporation of teaching plans into critical path documentation systems is discussed in Chapters 17 and 20.

Thoughtful planning of patient teaching maximizes the patient's learning while ensuring the most efficient use of your time and skills. Learner outcomes are developed for each diagnosis of or patient problem related to a learning need. The nursing actions become the content, teaching strategy, and learner activity columns of the written plan. This phase requires thought and creativity. Your efforts are rewarded when the patient meets the outcomes at the end of the implementation phase.

When planning for learning, decide with the patient who should be included in the learning sessions. When the patient is a young child, one or both parents or a caregiver may be the primary learners. For an adult patient, a spouse, partner, caregiver, or close friend who will be giving the care that is to be learned may be included. For instance, the person who does the household's cooking is usually asked to be present for nutritional teaching. Teaching plans are developed according to the needs of the people being taught.

One or several nurses can prepare and use a teaching plan. When two or more nurses plan and coordinate the implementation of the plan, this is called team teaching. An advantage of team teaching is that it takes advantage of the talents of more than one nurse.

Duplicating teaching that has already been completed by other members of the health care team wastes time and causes frustration. Accurate and thorough documentation of all patient teaching, along with review of the health record before teaching sessions and effective communication with members of the interdisciplinary team, can prevent this problem.

Several factors should be considered while formulating any teaching plan, as discussed in the next sections.

Patient Learning Outcomes

Learner outcomes are written in the same manner as the patient outcomes in the nursing process (see Chapter 17). When planning for the patient's learning, first determine which of the three learning domains (cognitive, psychomotor, or affective) is the focus of teaching. Then write learning outcomes that reflect what learning is to occur. Learning outcomes should be stated as desired or expected patient behaviors, rather than as nursing interventions. For a patient having difficulty sleeping, for example, an appropriate learning outcome is "Avoid foods, beverages, and over-the-counter medications in the evening that contain caffeine" rather than "Teach the patient about foods and beverages that contain caffeine," which states a nursing behavior. A well-constructed learning outcome is measurable and serves as a guide for planning evaluation methods.

Choosing the verb for a learning outcome is probably the most difficult part of writing outcomes (Box 9-8). But a careful choice based on the learning domain that is the focus of the teaching makes it easier to plan the content, teaching strategies, learner activities, and evaluation.

Concept Mastery Alert

The domains of learning guide the learning outcomes. It is helpful to remember the following: "cognitive" is "knowledge"; "psychomotor" is "action"; "affective" is "feelings."

The number of outcomes needed for each diagnosis/patient problem varies. It's better to have several specific outcomes than to try to cover everything with only one or two broad outcomes. Many nurses write one long-term, general outcome for each diagnosis/patient problem, followed by several short-term, specific outcomes. For example, a long-term outcome for the sample teaching plan could be: "The patient will be able to breastfeed her infant as long as desired without sore nipples." This outcome could be met in 2 weeks or 2 years, depending on how long the woman decides to breastfeed. Long-term outcomes are general statements. On the other hand, the short-term outcomes written in the learner outcome column of the sample teaching plan (see Box 9-7) are specific behaviors to be accomplished within a specified time (e.g., "The patient immediately begins protective measures to prevent nipple cracking").

Patients and appropriate family members or caregivers should be included in planning the outcomes. When patients value the learning outcomes, their readiness to learn is enhanced, increasing the likelihood that they will achieve the goals.

Teaching Content

After writing the learner outcomes, decide what information the patient needs to complete them. This is the content of the teaching plan. The most effective teaching plans address the most important topics relevant to the patient's care. New nurses usually need to research the subject to be taught to determine what information exists about the topic. Extensive information is easily accessible online, along with handouts, books, and journal articles available in many nursing units. Content supported by nursing research is called evidence-based and reflects the most accurate and clinically supported information (see Chapter 2).

Nurses are often concerned about just how much patients should learn about topics such as illness, procedures, medications, and surgeries. Patients benefit, for example, from explanations of the physical sensations they will experience during a procedure. They appreciate knowing in advance what they will feel, taste, hear, see, and smell.

Content explaining why certain treatments and medications are needed is included in the teaching plan. Information on the prevention of illness or its complications should also be covered. Again, patients are more likely to implement a plan that they understand and value.

Teaching Methods and Instructional Materials

The techniques used by a teacher to promote learning are called teaching methods. A **teaching method** is the way information is taught that brings the learner into contact with what is to be learned (role play, group discussion, demonstration, simulation) (Bastable, 2017, 2019). **Instructional materials** are the objects or vehicles (such as printed handouts, videos, podcasts) used to communicate information (Bastable, 2017, 2019).

TEACHING METHODS

No one method is right for teaching all learners in all settings, nor is one method more effective for changing behavior in any of the three domains (Bastable, 2017). Combine methods or use one method with one or more instructional materials to meet the needs of the learner. Bastable (2017) emphasizes the importance of selecting appropriate methods for the individual learner and those that will actively involve the learner to achieve positive outcomes. Choose methods depending on your familiarity with the method, the availability of educational resources and teaching materials, and the characteristics of the individual patient or audience. Select the technique that requires the most active participation of the learner to increase the chance for learning success (Holli & Beto, 2018). It is also important to use age/developmental level-appropriate methods; for example, a 10-year-old child will be more receptive to gaming or role play, whereas an adult could learn similar material through a self-instruction module.

Use a variety of teaching strategies to enhance learning. Box 9-9 provides suggested teaching strategies for the three learning domains. The sample teaching plan (see Box 9-7 on page 224) shows how teaching strategies vary

according to the learner outcomes and content of that particular plan. Again, be creative in choosing your methods. When providing teaching and learning opportunities and interventions, try to stimulate as many of the patient's senses as possible. Seeing, hearing, and touching reinforce what is read or heard. Continuously assess and validate how learning was accepted and understood, and provide repetition as necessary. Descriptions of common teaching strategies follow.

Role Modeling

The old saying "actions speak louder than words" explains why role modeling is effective. Patients watch their nurses closely; use this as an opportunity to improve a patient's behavior. Nurses have many opportunities to be personal examples of competency in skill performance, enthusiasm, and interest about an issue, and appropriate interactions with others (Bastable, 2017). For example, nurses who formerly smoked can be role models for patients who are trying to quit smoking. Nurses who diligently wash their hands before any patient encounter or procedure demonstrate the value and importance of handwashing.

Consider **Marco García Ramírez**, the father-to-be concerned about his role as a parent. The nurse acts as a role model to the couple when demonstrating newborn care.

Lecture

In education, lecture refers to a presentation of information by a teacher to a learner. It is a passive method of informing and transferring knowledge and relies on the listening skills of the learner (Holli & Beto, 2018). To be more effective, lectures should include question-and-answer periods and collaboration with the learner. This strategy can be used to deliver information to a large group of patients but is more effective when the session is interactive; it is rarely used for individual instruction, except in combination with other strategies.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Discussion

Discussion involves a two-way exchange of information, ideas, and feelings between the teacher and learners. Discussion promotes active participation by learners (Holli & Beto, 2018). It is an effective method when used by a nurse who is comfortable with leading a group and knowledgeable about group processes (see Chapter 8). It can also be an effective method for one-on-one instruction. The Teach-Back Method can be an integral part of a discussion (refer to page 218).

Remember **Alicia Bonet**, the young mother who had to make a decision about long-term aspirin therapy for her baby. The nurse could use a discussion to present information to Ms. Bonet about aspirin therapy, its risks and benefits, and Reye syndrome. The nurse would also provide time for Ms. Bonet to ask questions and think about the information presented.

Panel Discussion

A panel discussion involves a presentation of information by two or more people. Panel discussions can be used to impart factual material but are also effective for sharing experiences and emotions. Debates are a form of panel discussion that includes multiple sides of a controversial topic. These methods are often used as educational interventions for a large group, although, as with lecture, very few learners may actually get a chance to actively participate in the discussion (Holli & Beto, 2018).

Demonstration and Return Demonstration

Demonstration of techniques, procedures, exercises, and the use of special equipment, combined with a lecture and discussion, is an effective strategy. You can evaluate the patient's learning using a return demonstration, as with the Teach-Back Method technique described earlier (refer to page 218). Practice sessions are often included for the learner. Models of body parts or practice models, such as a resuscitation model, are frequently used. Childbirth educators usually demonstrate the birth of a baby by using a pelvic model, knitted uterus, and baby doll.

Discovery

In discovery learning, a problem or situation is presented to the patient or group of patients, who are then guided to discover the solution or approach. Discussion of other possible approaches and solutions can follow the patient's own solutions. This active participation in the learning process results in improved problem solving, creativity, responsibility, and independent thinking (Bruner, 1961). For instance, you could give a group of diabetic patients a short description of a situation that includes signs and symptoms, asking them to decide whether they indicate hypoglycemia (low blood sugar) or hyperglycemia (high blood sugar) and what measures to take. Then discuss the group's decision as a further learning experience. Even if the patients choose a poor solution, it can be turned into an effective learning experience. Other learning models that are based upon discovery learning include problem-based learning, simulation-based learning, and case-based learning.

Recall **Rachel Blumenthal**, the wife of the patient who had a myocardial infarction. The nurse could present the couple with a "what-if" situation, such as, "What if your husband started to have chest pain while you were cuddling and kissing? How would you handle the situation?" From her answer, the nurse would be able to tell how well Mr. and Mrs. Blumenthal understand information provided related to home

care. The nurse would also have an opportunity for reinstruction, reinforcement, and validation of learning.

Role Playing

Role playing gives the learner a chance to experience, relive, or anticipate an event. You explain a scenario and allow the patient to play out the scene with you or with one or more other learners. It is intended to arouse feelings and elicit emotional responses in the learners and is used primarily to achieve objectives in the affective domain (Bastable, 2019). Role playing can be used to work through emotional traumas or to plan for possible traumas; gain an understanding of others and why they behave the way they do; and practice new behaviors in a relatively safe environment (Holli & Beto, 2018). For example, role playing could help a teenage girl prepare to tell her parent about her pregnancy by letting the girl play herself while you play the girl's parent. This would help the patient rehearse what she wanted to say and anticipate the emotional atmosphere that she will experience. Role playing is a good strategy for children as well as adults. Puppets and dolls can be used as part of the process to help young children express negative feelings about hospitalization and traumatic procedures (Fig. 9-4).

INSTRUCTIONAL MATERIALS AND LEARNING ACTIVITIES

While planning teaching methods, also decide what instructional materials will be used to communicate the information, and any learning activities the patient should do independently. There are many ways that the patient can preview new material or reinforce what has already been taught. Printed materials, audiovisual materials, and programmed instruction materials are often assigned as part of the teaching plan.

FIGURE 9-4. Role playing can help children learn and express negative feelings resulting from hospitalization and traumatic procedures. (*Source:* Used with permission from Shutterstock. *Photo by Joe Mitchell.*)

Audiovisual Materials

Audiovisual materials such as computer programs, online courses, technology-driven learning tools, presentations using presentation tools such as PowerPoint or Prezi, films, television programs, flip charts, posters, and diagrams are popular and effective teaching strategies when combined with a lecture or discussion. Chosen materials must be in the preferred language of the learner and be at an appropriate level for the learner. As discussed earlier, never assume that the patient is literate. Also, never use AV materials as the sole source of learning for a patient. The patient may view the material independently, but it should be preceded and followed with a discussion or evaluation of comprehension of the material, with opportunity for questions, clarification, and validation.

Written Materials

The first consideration with printed material is availability. Many brochures, fact sheets, and pamphlets are available at no cost from online sources. Many nurses have also written materials for distribution to patients. Writing instruction sheets, books, and comic books for health teaching can be rewarding as well as useful. Like audiovisual materials, printed materials are generally used in conjunction with other strategies. It is also relatively easy to make games, which are a popular and fun way for patients to learn. For instance, cards with pictures of foods can be used to create a nutritional instruction game.

- Chest Pain or Discomfort
  Discomfort in the center or left side of the chest that lasts more than a few minutes or goes away and comes back. May feel like pressure, squeezing, fullness, or pain. May also feel like heartburn or indigestion.
- Other Upper Body Pain or Discomfort
  May be felt in one or both arms, the back, shoulders, neck, jaw, or upper part of the stomach (above the belly button).
- Shortness of Breath
  May be the only symptom, or it may occur before or along with chest pain or discomfort. May occur when resting or during easy activities.
- Other Possible Symptoms
  May include breaking out in a cold sweat, feeling unusually tired, nausea, or lightheadedness. Any sudden new symptom or change in usual symptoms also should be a concern.

  If you think you might be having heart attack symptoms or a heart attack, call 9-1-1 immediately. Do not ignore your pain or discomfort. Every minute matters when it comes to getting treatment for heart attacks.

  Never delay calling 9-1-1 to take aspirin or do anything else you think might help.

  If you are unable to reach 9-1-1, have someone else drive you to the hospital right away. Don't drive yourself to the hospital. You may cause a car accident.

Source: National Heart, Lung, and Blood Institute. (2011). *Heart attack: Know the symptoms. Take action*. U.S. Department of Health and Human Services. https://www.nhlbi.nih.gov/files/docs/public/heart/heart_attack_fs_en.pdf

Select printed materials carefully based on how well they present the needed content in a format that is attractive, understandable, and helpful. Graphics and pictures can be used to enhance explanation and promote understanding (Bastable, 2017). The use of pictures can be an effective method of education for populations with limited health literacy (Winokur et al., 2019). Printed materials must be in the preferred language of the learner and be at an appropriate level for the learner. This may be challenging, in part because health care information and directions have traditionally been written at a 10th-grade level or higher; guidelines suggest health education material should be written at a 4th- to 6th-grade level, using short sentences and simple words, and incorporate pictures (Patient Safety Network, 2019). A sample of patient education material appears in Box 9-10.

Consider how the nurse handled the situation of **Alicia Bonet**, the young mother described in the Reflective Practice box. The nurse provided Ms. Bonet with written materials that were at a level she could understand, thereby helping her make her decision.

Demonstration Materials

Demonstration materials stimulate a learner's senses as well as add variety, realism, and enjoyment to the teaching–learning experience (Bastable, 2017). Models and real equipment and displays, such as posters, flip charts, and bulletin boards are examples of demonstration materials. Demonstration materials bring the learner closer to reality and actively engage the patient in learning (Bastable, 2017).

Programmed Instruction

Most programmed instruction books or booklets are prepared so that learners can use them independently of a teacher. However, educators generally agree on the need to spend time with the learner before and after the program to clarify the information, answer questions, and provide the personal touch necessary for a learner's motivation. Because this is a self-paced strategy, it can be beneficial for many learners. Printed materials must be in the preferred language of the learner and be at an appropriate level for the learner.

Web-Based Instruction and Technology

Websites appropriate to the patient's disease process, wellness interests, or health promotion focus can be valuable teaching and learning resources. There are various free or affordable applications (apps) that provide choices for nurses and patients to identify what works best in individual circumstances (Shustack, 2019). There are many websites and/or apps can support instruction. These sites and tools provide consumer information that is formatted for easy reading and access. Programmed instruction or web-based instruction and apps can be particularly useful for patients in isolated areas, especially when it is interspersed with opportunities to see the nurse or other health care provider in person. Be sure to evaluate the website or app chosen by the patient and advise the patient on its suitability and accuracy because some information found on the internet is not grounded in scientific, medical, or nursing research. Opportunities for the use of technology integrated into patient education are endless. For example, mobile phone–based social networking has been used to support self-management education and behaviors for patients with hypertension (Ghezeljeh et al., 2018).

Technology Alert

Technology platforms are being developed and used to help patients and their families engage in the care process. One example of such a network uses the intensive care unit patient's bedside television to deliver patient education using a combination of direct instruction and model patient re-enactments of situations in order to display situations that could be encountered during the hospital stay. The use of this technology resulted in patient and caregiver reports of perceived decreased anxiety and that television was a useful tool for providing health literacy education (Thompson Bastin et al., 2019).

Box 9-11 **Example of a Contractual Agreement Between a Nurse and a Patient**

I will participate in the learning activities needed to help me learn about my low-sodium diet. During my hospital stay, I will attend the class on low-sodium diets, read the materials given to me, and ask questions as I need to. I will work with S. Moore, RN, to plan my meals and food preparation at home. If I need help when I get home, I will contact S. Moore.

Jim Mall

I will provide Jim Mall with the experiences needed for him to follow his low-sodium diet accurately.

S. Moore, RN

Contractual Agreements

A **contractual agreement** is a pact between two people setting out mutually agreed-on goals. Contracts between nurses and patients are common in many health care settings. The contracts are usually informal and not legally binding. When teaching a patient, such an agreement can serve to motivate both the patient and you as the teacher to do what is necessary to meet the patient's learning outcomes. The agreement notes the responsibilities of both the teacher and the learner, emphasizing the importance of the mutual commitment, as well as provides a measurement of how close the patient is to reaching the goals (Holli & Beto, 2018) (Box 9-11). If the contracted outcomes are achieved, you can boost the patient's self-esteem with rewards; if the outcomes are not achieved, you can try different teaching techniques.

Implementing

Implementing the teaching plan requires interpersonal skills and effective communication techniques, as well as organizational and time management skills. Teaching the patient can be a major part of the working phase of the

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

helping relationship (refer to Chapter 8).

Time Constraints

Nurses often encounter challenges in finding time to meet patients' needs, so consideration of time constraints is important when implementing teaching and learning activities. Lack of time to teach is cited by nurses as the greatest barrier to being able to carry out their role effectively (Bastable, 2017, p. 14). Set priorities in order to teach essential content thoroughly. Less important content can be taught last so that the more important learner outcomes can be met within the time available. If time permits, the remaining content can be addressed.

To meet time constraints, nurses often plan together. Teamwork and cooperation allow nurses to meet deadlines. Patient education is provided during hospitalization, home visits, and clinic visits, and in scheduled learning opportunities through outpatient programs or referrals to community-based programs. Home health care nurses often receive referrals from hospital nurses to continue the teaching begun during a patient's hospitalization. Discharge planning from a facility must be started early to ensure continuity of teaching.

FIGURE 9-5. One-to-one teaching is used in many nurse–patient situations.

Scheduling

It is better to plan shorter, more frequent teaching sessions than one or two longer sessions. Short sessions allow patients to digest the new material and prevent them from becoming too tired or uncomfortable because of a health problem. Sessions of 15 to 30 minutes are generally well tolerated. Usually, more formal classroom programs last for more than 1 hour; in such cases, provide a break after every 50 minutes of class time. Include the patient when planning the time and frequency of lessons. Scheduling teaching sessions when the patient is least stressed will enhance teaching.

Group Versus Individual Teaching

Learner outcomes influence the use of group versus individual, one-on-one instruction. Some learner outcomes are met more readily in a one-to-one encounter, which provides a nonthreatening environment to meet individual needs and goals (Bastable, 2017) (Fig. 9-5). Other learner outcomes are achieved more easily in a group, which can foster social skills and maintain contact with others through shared experiences (Bastable, 2017). For example, the outcome "The patient will change the dressing using clean technique" is best taught and evaluated in a private session. The outcome "The patient will discuss feelings about diabetes self-management" might be met more easily in a group discussion with other patients.

Formal Versus Informal Teaching

Many nurse–patient interactions can include **informal teaching**. These unplanned teaching sessions are often effective because they deal with the patient's immediate learning needs and concerns. Discussion as simple as reinforcing the correct technique for postoperative deep breathing exercises or explaining or clarifying information about a scheduled procedure is actually teaching. Informal teaching may also lead to additional planned, formal sessions. **Formal teaching** is planned, scheduled teaching done to address specific identified learner outcomes. Both forms are effective when used appropriately.

Additional Implementation Considerations

Nurses must continually observe the patient for additional assessment data that could alter the original teaching plan. This requires skill in adapting and reorganizing the teaching plan. Following are important considerations when implementing a teaching plan:

- *Promote patient learning by using a warm and accepting approach*. Your attitude has more effect on the patient than any other factor (Fig. 9-6). Avoid taking a condescending attitude and using technical and medical terms (unless the patient has a background in this area). A nonthreatening teaching–learning atmosphere allows learning to occur.
- *Consider the physical environment when implementing the teaching plan*. Some planning may be needed to ensure adequate space and lighting, comfortable chairs, and good ventilation. Privacy is also important, as is freedom from distractions and interruptions.
- *Review the patient's expectations and role functions as a learner*. To avoid any misunderstandings, review the contractual agreement before implementing the teaching plan. The patient is expected to listen, observe, engage, and attempt to understand what is being taught.
- *Assess the patient's comfort level*. Some people are uncomfortable in the role of learner. You need to recognize this problem in order to assist the patient to assume the role more easily. If the patient must learn special techniques or procedures (e.g., colostomy care, self-injections, eye medication instillation), assure the patient that it takes time and practice before anyone can perform new skills confidently.
- *Be prepared and organized before implementing the teaching plan*. Gather and organize all teaching aids (e.g., posters, films, printed materials) before the teaching session. A disorganized teacher distracts the learner and hinders learning. Also, a procedure or skill must be taught in the correct sequence so that the patient does not become confused.

FIGURE 9-6. The nurse's warm approach is an important factor in interpersonal relationships. (*Source: Photo by Monkey Business Images/Shutterstock*.)

- *Make each learning session interesting and enjoyable for the patient*. Have an enthusiastic and positive attitude, and make learning fun by creative use of planned teaching strategies. When you approach teaching positively, the patient is more likely to approach learning in a similar way.

Role of the Nurse as Coach

With the implementation of the 2010 Affordable Care Act and the goals outlined in the *Healthy People 2030* initiative, there is a clear need to address the direction of health care in the future (Office of Disease Prevention and Health Promotion, 2020; USDHHS, 2019). Health challenges are more complex these days, and nurses need to be prepared to move from a disease-based model of care toward a health and wellness promotion model. The IOM's (2011) report, *The Future of Nursing: Leading Change, Advancing Health*, emphasizes the need for nurses to assume a leadership role that includes collaborating and coordinating care across teams of health professionals. The nurse coach role is an integral component of this partnership and assists patients and families to make changes that promote healthier lifestyles.

Nurses who incorporate coaching into their professional practice can improve the quality and effectiveness of care. A **nurse coach** integrates coaching competencies to facilitate a process of change or development that assists individuals or groups to realize their potential and ability to cope with health challenges (Delaney et al., 2020; Hess et al., 2013). Nurse coaches utilize a whole-person, relationship-centered approach to educate and empower patients (Delaney et al., 2020). A nurse coach establishes a partnership with a patient and uses discovery to identify the patient's personal goals and agenda in a way that will result in change rather than using teaching and education strategies directed by the nurse as the expert. Nurse coaches may practice in any setting or specialty area, such as diabetes education or cardiac rehabilitation, and may be staff nurses, advanced-practice nurses, educators, and administrators. The nurse coach role is supported by coaching education, training, and experience and is influenced by the population served.

The nurse coaching process includes the following (Delaney et al., 2020; Hess et al., 2013):

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

- Establishing relationships and identifying readiness for change
- Identifying opportunities, issues, and concerns
- Establishing patient (person)-centered goals
- Creating the structure of the coaching interaction
- Empowering and motivating patients activate lasting wellness behaviors to reach goals
- Assisting the patient to determine progress toward goals

The role of nurse coach is evolving and should not be confused with that of a preceptor or mentor. A nurse coach explores the patient's readiness for change, plans and structures the coaching interactions, supports the achievement of the patient's desired goals, and with the patient determines how to evaluate the attainment of patient goals (American Holistic Nurses Association, n.d.). Health maintenance organizations and various health and wellness programs have nurse coaches to assist patients to improve health outcomes. Professional nursing organizations recognize the need to further define the definition of a nurse coach and develop a nurse coach certification program and process.

Evaluating

The nurse and the patient and family/caregivers work together to measure how well the outcomes specified in the plan of care have been achieved.

Evaluating Learning

Nurses cannot be sure that patients have actually learned the content without some type of proof or feedback. The key to evaluation is the learner outcomes in the teaching plan that describe the behaviors to be measured. The results of evaluation provided evidence to guide future action in planning and carrying out educational interventions (Bastable, 2019). Methods for obtaining feedback about learning are discussed in the following section.

METHODS OF EVALUATION

There are several methods of evaluation of learning. For instance, cognitive domain learning may be evaluated through oral questioning, affective domain learning through the patient's response, and psychomotor domain learning by a return demonstration. Consider this learner outcome in the cognitive domain: "The patient will be able to describe what a blood pressure reading represents." To evaluate this, you could ask the patient, "Tell me what this blood pressure reading means to you." The patient then has a chance to talk about the reading while you evaluate the patient's understanding of it.

Asking direct questions is often an efficient method of evaluating learner outcomes. Simply ask the patient a question, and the answer reflects the patient's level of knowledge about a topic. Direct questions can also be used to evaluate the patient's affective learning.

Another way to decide whether learner outcomes have been met is to analyze the patient's own comments. Patients may state that they understand the information while avoiding further discussion of the topic. In such instances, using effective communication techniques when reintroducing the topic at a later time might provide the evaluation data needed.

Sometimes observational skills can help determine whether the patient is using the material learned. For example, observing what the patient has ordered for lunch shows whether dietary lessons are being put into practice. A nurse also uses observation when evaluating the patient's psychomotor skills. A return demonstration is an excellent way of evaluating psychomotor domain learning (Fig. 9-7 on page 232). Providing an opportunity for and encouraging patients to change their own dressing, for example, provides concrete evidence of satisfactory or unsatisfactory performance of the procedure. However, you must take care to promote a nonstressful environment when the time comes for the patient's return demonstration.

FIGURE 9-7. Patient correctly demonstrates what has been taught, validating learning has occurred.

TIMING OF EVALUATION

Evaluation of learning is ongoing. If learning is only evaluated as soon as teaching is completed, the results may be misleading. Nurses may evaluate what the patient has learned from educational sessions the previous day. Home health care nurses may evaluate what the patient learned in the hospital, as well as what is being taught during home visits. Hospital nurses often check with family members/caregivers or significant others after discharge to evaluate whether learner outcomes have been met.

Reinforcing and Celebrating Learning

Most people feel encouraged and supported when their efforts are acknowledged by another person, especially when they trust and value the other person. This is especially true in health care, where patients often feel overwhelmed by their illness. To make the most of this dynamic, use **positive reinforcement** to affirm the efforts of patients who have mastered new knowledge, attitudes, or skills. Reinforcement may be as simple as a few words of acknowledgment ("You've mastered this diet quickly"), as spontaneous as a warm hug, or as planned as the entire staff joining to celebrate a patient's independent ambulation. **Negative reinforcement**—criticism or punishment—is generally ineffective; undesirable behavior is usually best ignored. Behavior modification programs that reward desired behaviors and ignore undesired behaviors can be designed for some patients.

Evaluating Teaching

Evaluation of teaching must occur so that you can capitalize on your strengths and work on improving weaknesses. Like all nursing roles, effective teaching requires practice and experience. Even nurse educators agree that they are always discovering better ways to promote learning. It is important not to feel discouraged when evaluations of your teaching are less than perfect.

It is best to evaluate your own teaching effectiveness immediately after a teaching session. This involves a quick review of how well you feel you implemented the plan. Mentally noting both the strengths and weaknesses of the teaching session helps you plan better for subsequent sessions.

Box 9-12 Factors Affecting Teaching Effectiveness

- Ignoring the restrictions of the patient's environment
- Failing to accept that patients have the right to change their mind
- Using medical jargon
- Failing to negotiate goals
- Duplicating teaching that other team members have done
- Overloading the patient with information
- Choosing the wrong time for teaching
- Not evaluating what the patient has learned
- Not reviewing educational media, or relying exclusively on media
- Failing to document patient teaching and plan for follow-up or teaching reinforcement

You can also seek feedback from patients. You can use a simple questionnaire at the end of a teaching session or after discharge to gain the patient's perception of your teaching effectiveness. Use a standardized questionnaire from the facility or prepare your own. When using an outcome format that requires only circles or checkmarks as answers, provide space for comments.

Revising the Plan

During evaluation, you or your patient might decide that revisions are needed in the teaching plan. When revising the plan, you should identify teaching factors that might have reduced teaching effectiveness (Box 9-12). A reassessment might indicate that some patient factors were not considered in the original plan, and adjustments might be made accordingly to meet the patient's needs. Often, the use of a different teaching strategy is all that is needed for a patient to achieve the learner outcomes.

Revision is a natural part of the teaching–learning process and should not be viewed negatively. Neither you nor the patient has "failed" when an outcome is not met. Most outcomes can be met with a change in approach, although sometimes the learner outcomes may be unrealistic. Further assessment might reveal that the content might be too complex or the time too short for successful achievement.

Unfolding Patient Stories: Rashid Ahmed • Part 1

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Rashid Ahmed is a 50-year-old male admitted to the medical unit with a diagnosis of dehydration from severe nausea, vomiting, and diarrhea. The nurse receives provider's orders containing abbreviations that are unclear and not accepted by the hospital. What steps would the nurse take to clarify the orders and deter the provider's use of error-prone documentation? Why is it important for all health care professionals to follow agency policies on documentation? (Rashid Ahmed's story continues in Chapter 20.)

Care for Rashid and other patients in a realistic virtual environment: ***vSim*** *for Nursing* (**thepoint.lww.com/vSimFunds**). Practice documenting these patients' care in DocuCare (**thepoint.lww.com/DocuCareEHR**).

Documenting

The nurse is legally responsible for documenting teaching in the patient's health record. Documentation of the teaching–learning process includes a summary of the learning need, the plan, the implementation of the plan, and the evaluation results. The evaluative statement is crucial and *must show concrete evidence that demonstrates that learning has occurred*. If the desired learning has not occurred, the patient's health record should indicate updated plans to address the problem or how the problem was resolved. It is not enough to document only what you taught; your charting *must show evidence that the patient or family member/caregiver has actually learned* the material taught.

NURSE AS COUNSELOR

Counseling is the "art of providing listening, advice, guidance, or direction regarding an action or decision to help a person change" (Holli & Beto, 2018, p. 137). Nurses counsel patients through this interpersonal process to assist patients in adapting to difficulties or changes in life experiences (Peplau, 1991) and help patients make decisions that promote their overall well-being. Counseling focuses on improving coping abilities, reinforcing healthy behaviors, fostering positive interactions, or preventing illness and disability (Boyd, 2018). Family members/caregivers or significant others are often included in counseling sessions. Everyone participating must feel comfortable in the situation and surroundings. Like teaching, counseling may be formal or informal.

The interpersonal skills of warmth, friendliness, openness, and empathy—skills required to develop therapeutic nurse–patient relationships—are necessary for successful counseling. Refer to Chapter 8 for discussion of therapeutic nurse–patient relationships. An effective counselor needs to be a caring person. Caring is based on a humanistic philosophy and caring is foundational to the nursing profession (Watson, 2008). A humanistic approach to counseling rooted in professional caring helps the patient strive toward the greatest health potential. Caring is important in all nursing roles but is fundamental in the counseling role.

Some advanced-practice psychiatric mental health nurses specialize in counseling, and this form of counseling has an important professional role. The focus in this chapter, however, is on the everyday counseling that is a basic component of all nurses' practice. This counseling involves listening carefully to the patient's or family's/caregivers questions, concerns, demands, and grievances and then responding in an effective manner.

Consider **Rachel Blumenthal**, the wife of the patient who had a myocardial infarction. By carefully listening to Mrs. Blumenthal's concerns, including her comment about being embarrassed to talk with her husband's cardiologist, the nurse helps to establish a trusting relationship that forms the basis for counseling.

Knowing appropriate responses to what a patient says might be difficult at first, but practice helps develop this skill

(refer to Chapter 8 for discussion of communication techniques). Each nurse–patient (or nurse–family/caregiver) interaction is unique; a nurse's response that works well with one patient might intimidate or anger another. Sensitivity to the unique needs of each patient and a willingness to get involved and make a difference are essential for effective counseling. Because counseling skills take time to cultivate, nursing students and new nurses should be aware of their limits and not rush to counsel without first considering consultation with more experienced nurses. Table 9-1 (on page 234) presents typical counseling situations you might experience and analyzes both effective and ineffective nursing responses. You might want to role play these situations with a friend.

In counseling situations, you do not tell patients what to do to solve the problem but instead assist and guide them to solve problems and make decisions. If the patient lacks the knowledge and skills to approach a problem systematically, you can combine the teaching and counseling roles to help the patient solve the dilemma successfully.

The nursing process is an essential tool when guiding/counseling patients. The nursing process is used to organize the nurse–patient counseling situation described in Box 9-13 (on page 235). Additional examples of health problems centered on counseling needs with related etiology and signs and symptoms can be found in the box titled Examples of Actual or Potential Health Problems and Needs: Counseling Needs (on page 235).

Types of Counseling

Counseling may be short or long term or motivational and may occur as the result of a situation or event or a developmental crisis.

Short-Term Counseling

Short-term counseling focuses on the immediate problem or concern of the patient or family/caregiver. It can be a relatively minor concern or a major crisis, but in any case, it requires immediate attention (Fig. 9-8). Short-term counseling might be used during a situational crisis, which occurs when a patient faces an event or situation that causes a disruption in life. For example, a patient in the hospital finds out that his wife has been involved in a car accident; she received only a few scratches, but their only car was demolished. As a nurse, you are in an excellent position to help the patient decide what can be done to solve this situational crisis. You can guide the patient to resources to help solve the travel, financial, and emotional difficulties that arise as a result of the accident. This holistic approach is especially important because the crisis could hinder the patient's recovery.

FIGURE 9-8. Counseling may involve a concern that needs immediate attention. (*Source:* Used with permission from Shutterstock. *Photo by Rick Brady.*)

Table 9-1 Analysis of Nursing Responses in Common Counseling Situations

INEFFECTIVE RESPONSE	ANALYSIS	EFFECTIVE RESPONSE	ANALYSIS
Situation A: You walk into the room of Ms. Goldstein, who learned earlier in the day that her tumor is malignant. She is crying.			
"Oh cheer up! Tomorrow's got to be a brighter day."	Provides false reassurance; communicates insensitivity to patient's feelings.	Touch forearm and sit next to her quietly. After several minutes, say, *"I can't even begin to imagine how difficult this must be for you. Please let me know if there is anything I can*	Uses touch, silence, and caring appropriately.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

		do to help."	
Situation B: You have been teaching 60-year-old Mr. Hyong diabetic self-care for 4 days, and he is still asking the same questions and refusing to administer his own insulin or check his blood sugar.			
"Well, I guess we are getting nowhere here. Is there anyone else who might be able to do this for you?"	Rejects patient without first evaluating the teaching plan and exploring patient variables that might be hindering learning.	*"We may have a bit of a problem here…. I hear you asking the same questions every day. Let's see if together we can figure out why this isn't making sense to you."*	Enlists patient in problem solving.
Situation C: One morning, you walk into the room of an older resident who had withdrawn and become totally dependent on the nurses for basic care on her transfer into the long-term care facility. You are surprised to discover that she has washed and dressed herself—for the first time.			
"Well, I'm happy to see that you have rejoined the ranks of the living. Did you wash off your glasses?"	Misses opportunity to celebrate the resident's achievement of an important goal.	Hugs resident warmly, looks her in the eye, and exclaims, *"Don't you look wonderful today? What are you celebrating?"* Defers an assessment of how thorough the morning care has been until later.	Rejoices spontaneously in the resident's achievement and reinforces this behavior. Gives the resident a reason to continue to make progress. Uses touch appropriately.
Situation D: You are helping Mr. Stein out of bed; he has been on bed rest for 2 weeks because of a painful and debilitating illness. A fiercely independent man, he is embarrassed to need your support and looks disgusted with himself when he steps on your foot.			
"What's the problem, Honey? Haven't been eating your Wheaties?"	Uses terms of endearment, which often denote disrespect and condescension to patients, no matter in what spirit they are uttered.	"No problem, Mr. Stein, my husband steps on my toes all the time when we go dancing!" After a few minutes … *"It must be hard when you are used to doing everything for yourself to all of a sudden find yourself needing others for simple things…."*	Uses humor and empathy appropriately; invites the patient to share his feelings.
Situation E: Ms. Berretta recently underwent surgery resulting in a urinary diversion. She should be able to change her own ostomy bag by this time, but she is still unwilling to look at the stoma and participate alone in her care. The nurses are getting impatient with her "childish" refusals to learn.			
"Really Helen, I'll do it myself but you'll be the loser once you get home with this thing and there's no one around to help."	Uses a threat in an attempt to coerce learning (negative reinforcement). Displays unwillingness to explore what is blocking Ms. Berretta's readiness to learn.	Before beginning Ms. Berretta's care: *"I think we need to talk before your care today. You will be discharged soon, and I want you to feel confident about caring for your stoma. I understand that until you can accept it, you don't want to learn anything about it. Would you like to talk about this with me, or*	Communicates respect for patient and sensitivity to her needs, without ignoring what is the real problem. Offers the possibility of a referral to another health care professional if the patient so wishes.

would you prefer me to make a referral to someone else?"

Box 9-13 **Example of Counseling for Problem Solving Using the Nursing Process**

Situation

Monday, 1930, Amy Purcell has been admitted to the children's unit with dehydration resulting from diarrhea. Amy is responding well to intravenous (IV) fluids. Her mother is visibly distraught.

Assessing

- Amy is doing well but will need 24 hours of IV therapy.
- Amy and her twin sister Susan have never been separated from their parents or each other. They are 2 years old.
- Mrs. Purcell has no idea who will care for Susan when Mr. Purcell goes to work in the morning.
- The Purcells have no regular childcare arrangements and have no family members in the area.
- Mrs. Purcell wants to stay with Amy during her hospitalization.
- The Purcells' neighbor is home during the day. Sometimes Amy and Susan play at her house.
- There is a day care center near their home, but Susan might be upset about going there. It's also expensive.
- Mr. Purcell cannot afford to take Tuesday off but will take Wednesday morning off.
- Insurance does not cover a private room, which would allow Susan to come to stay in the hospital too.

Diagnosing

Actual Health Problems and Need: Anxiety

Etiologic Factors: Stress of daughter's hospitalization, need for childcare for Susan, and uncertain resources

Signs and Symptoms: Refer to Assessment data above.

Planning Goal

Mrs. Purcell will demonstrate decreased anxiety over the care of Susan during Amy's hospitalization.

Together, Mrs. Purcell and the nurse have planned the following:

- The neighbor will come to the Purcell home to care for Susan when Mr. Purcell leaves for work on Tuesday morning.
- The neighbor will bring Susan to the hospital for the afternoon visiting hours to be with Mrs. Purcell and Amy.
- Mr. Purcell will come to the hospital after work to have dinner with the family.
- Mr. Purcell will take Susan home for bedtime.
- On Wednesday morning, Mr. Purcell will take off work in the morning. He and Susan will go to the hospital to pick up Mrs. Purcell and Amy.

Implementing

Plan implemented by the Purcells with support of the nursing staff.

Evaluating

Mrs. Purcell told the nurse that she feels that both Amy and Susan did well with the care they received from their parents. The family's stress was minimized, and she is relieved that everything went so well. The nurse decides that the goals were met.

Long-Term Counseling

Long-term counseling extends over a prolonged period. A patient might need the counsel of the nurse at daily, weekly, or monthly intervals. A patient experiencing a developmental crisis, for example, might need long-term counseling. A developmental crisis can occur when a person is going through a developmental stage or passage. For example, many women going through menopause need help adjusting to the changes they experience. Long-term counseling may occur in nurse-led support groups.

Examples of Actual or Potential Health Problems and Needs

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

COUNSELING NEEDS		
Actual or Potential Health Problems and Needs	**Possible Etiologic Factors**	**Potential Signs and Symptoms**
Decisional Conflict	• Conflict with moral obligation • Insufficient support system	• "I don't know what to do!" • Delay in decision making • Inability to authorize withdrawal of life-sustaining treatment despite believing this to be in the patient's best interests
Hopelessness	Prolonged social isolation and belief that "even God has abandoned me"	• Progression of debilitating symptoms • Poor eye contact • Flat affect • Indecisive
Situational Low Self-Esteem	Recent lay-off and divorce	• "I can't do what you are asking me to do." • "I am worthless."

Motivational Interviewing

Motivational interviewing is an evidence-based counseling approach to evoke and strengthen a patient's motivation and commitment to change (Miller & Rollnick, 2013). This method of guidance promotes behavior change by guiding patients to explore their own values and motivation for change and the advantages and disadvantages of their decisions (Caccavale et al., 2020; Morgan & Townsend, 2021). Motivational interviewing incorporates active listening and verbal therapeutic communications techniques, focusing on what the patient wants rather than on what the nurse thinks should be the next steps in behavior change (Morgan & Townsend, 2021). Four main principles guide this technique: expressing empathy, supporting self-efficacy, developing discrepancy, and rolling with resistance (Dart, 2011). These principles allow the patient to share their perspectives; ensure the nurse does not impose their own beliefs onto the patient; assist the patient to gain insight into the difference between where they are and where they want to be; and allows the patient to share their negative thoughts without challenge from the nurse (Dart, 2011).

Gance-Cleveland (2013) proposed that the traditional model of counseling may not prove effective for an issue such as the childhood obesity epidemic. Instead, a collaborative, family-centered model that includes motivational interviewing may help the family identify health goals. Instead of focusing on solutions to the obesity issue, the nurse attempts to gain a better understanding of the barriers that exist to changing family behaviors. With this technique, families gain the self-confidence needed to promote better health outcomes. This is not the traditional approach, and it requires time to establish relationships and explore family perspectives, but motivational interviewing can be an effective alternative to deal with a severe health problem.

When assessing a motivational problem, always consider the patient's cultural values. Often the way a person feels about something is strongly influenced by that person's cultural background. For instance, if a person has grown up in a family in which illness is perceived as an inevitable result of aging, it may be difficult to motivate that person to practice preventive measures for health (see Chapter 5). Such a problem may seem insurmountable, yet a caring nurse can work toward helping patients with this mindset become interested in promoting their own health.

Referrals

Sometimes a patient needs specialized counseling from a nurse with advanced training or from other health care professionals. In these cases, offer to refer the patient to the appropriate professional (e.g., psychiatric or mental health nurse, psychologist or psychiatrist, social worker, clergy, financial counselor, sex therapist, or occupational therapist). In other cases, a simple referral to a community resource, such as a neighborhood support group, may be appropriate to address the patient's needs. When making a referral, be sure to address any barriers that might prevent the patient from acting on the referral. Patients might fail to follow-up with a referral for financial reasons, because they do not understand the reason for or value of the referral, because they lack transportation, because the facility is not open at times convenient for them or there are other access issues.

REFLECTIVE PRACTICE LEADING TO PERSONAL LEARNING

Remember that the goal of reflective practice is to look at an experience, understand it, and learn from it. As you begin to use and develop expertise as a teacher and counselor, reflect on your experiences—both successes and failures—in order to improve your practice. How can you do it better next time? What did you learn today that can help you tomorrow? Begin your reflection by paying close attention to the following while providing nursing care:

- Did your preparation and practice related to the use of verbal and nonverbal communication techniques result in your feeling confident in your ability to provide care to meet the identified educational and counseling needs? Did your competence and confidence inspire the patient's and family's/caregiver's trust?
- How did you prioritize the data you collected? What patterns in the data did you identify?
- What knowledge from your learning, personal experience and intuition did you use to make decisions and develop your plan of care?
- How confident are you that the data you reported and recorded accurately communicate the status of the patient? How successfully have you communicated who this patient and family/caregivers are to the interdisciplinary team?
- Were you aware of any cultural or ethnic beliefs or practices that may have influenced your communication or development of a helping relationship with patients or family members/caregivers? Were you aware of any stereotypes or prejudices that may have negatively influenced the encounter? If so, how did you address these?
- Did the patient and family/caregivers participate in the process at an optimal level? How might you have better engaged the patient and family/caregivers? Did the patient sense that you are respectful, caring, and competent?

Perhaps the most important questions to reflect on are: Are your patients and their families/caregivers better for having had *you* share in the critical responsibility of being a part of their health care team? Are your patients now receiving thoughtful, person-centered, prioritized, holistic, evidence-based treatment and care because of your efforts?

DEVELOPING CLINICAL REASONING AND CLINICAL JUDGMENT

. Explain what the following statement means: "It is as important for patients to understand and value the proposed treatment regimen as it is for them to understand how to implement the proposed regimen." What are the implications of this for teaching and counseling?

. A patient your age has just learned that she has tested positive for the human immunodeficiency virus (HIV). Make a list of some of the learning (cognitive, psychomotor, affective) that you think should take place. What sorts of things might affect their readiness to learn? How would you tailor your nursing in response to these variables?

. Mrs. Riley is being readmitted to your hospital unit with complications related to her diabetes. A coworker voices her frustrations and says, "We've taught her everything she needs to know to do a better job of managing her diabetes. I don't know what more we can do." How do you respond?

PRACTICING FOR NCLEX

. A nurse is teaching first aid to counselors of a summer camp for children with asthma. This is an example of what aim of health teaching?

a. Promoting health
b. Preventing illness
c. Restoring health
d. Facilitating coping

. A nurse is teaching patients of all ages in a hospital setting. Which teaching examples are appropriate for the patient's developmental level? Select all that apply.

a. The nurse plans long teaching sessions to discuss diet modifications for an older adult diagnosed with type 2 diabetes.
b. The nurse recognizes that a female adolescent diagnosed with anorexia is still dependent on her parents and includes them in all teaching sessions.
c. The nurse designs an exercise program for a sedentary older adult male patient based on the activities he prefers.
d. The nurse includes an 8-year-old patient in the teaching plan for managing cystic fibrosis.
e. The nurse demonstrates how to use an inhaler to an 11-year-old male patient and includes his mother in the session to reinforce the teaching.
f. The nurse continues a teaching session on STIs for a sexually active male adolescent despite his protest that "I've heard enough already!"

. A nurse is teaching an adult patient how to care for their new ostomy appliance. Which evaluation method is most appropriate to confirm that the patient has learned the information?

a. Ask Me 3
b. Newest Vital Sign (NVS)

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

c. Teach-Back Method
d. TEACH acronym

. A nurse is planning teaching strategies in the affective domain of learning for patients with alcohol use disorders. Which teaching–learning activities will the nurse use? Select all that apply.
a. Preparing a lecture on the harmful long-term effects of alcohol on the body
b. Asking the patient to discuss reasons people with alcohol use disorders drink and exploring other methods of coping with problems
c. Requesting that patients perform a return demonstration for using relaxation exercises to relieve stress
d. Helping patients to reaffirm their feelings of self-worth and relate this to their alcohol use disorder
e. Using a pamphlet to discuss the tenets of the Alcoholics Anonymous program with patients
f. Reinforcing the mental benefits of gaining self-control over a substance use disorder

. A nurse is preparing a teaching plan for a patient with asthma on the use of an inhaler. What teaching method is most appropriate for this patient?
a. Demonstration
b. Lecture
c. Discovery
d. Panel session

. The nurse has taught a patient with diabetes how to administer subcutaneous insulin injections. Which is the best strategy to evaluate if the teaching goal has been met?
a. Ask the patient the insulin dose and times of day they will administer insulin.
b. Observe the patient's technique in drawing up and administering insulin.
c. Have the patient explain the skill they have just learned.
d. Document the teaching session in the patient's electronic health record.

. A registered nurse acts as nurse coach to provide teaching to patients who are recovering from a stroke. Which statement directs the nurse in performing this role?
a. The nurse uses discovery to identify the patients' personal goals and create a plan that will result in change.
b. The nurse is the expert in providing teaching and education strategies to provide dietary and activity modifications.
c. The nurse becomes a mentor to the patients and encourages them to create their own fitness programs.
d. The nurse assumes an authoritative role to design the structure of the coaching session and support the achievement of patient goals.

. A nurse on the rehabilitation unit is counseling a young adult athlete who sustained a traumatic below-the-knee amputation following a motorcycle accident. The patient refuses to eat or ambulate, stating, "What's the point? My life is over. I'll never be the football player I dreamed of becoming." What is the nurse counselor's best response?
a. "You're young and have your whole life ahead of you. You should focus on your rehabilitation and make something of your life."
b. "I understand how you must feel. I wanted to be a famous singer, but I wasn't born with the talent to be successful at it."
c. "You should concentrate on other sports that you could play even with prosthesis."
d. "I understand this is difficult for you. Would you like to talk about it now or would you prefer me to make a referral to someone else?"

. A nurse is caring for a patient who is admitted to the hospital with traumatic injuries sustained in a motor vehicle accident. While hospitalized, the patient's spouse tells the patient that their house flooded, damaging their belongings. When the nurse notes that the patient is visibly upset by this news, the nurse suggests which type of counseling?
a. Long-term developmental
b. Short-term situational
c. Short-term motivational
d. Long-term motivational

. A nurse develops a contractual agreement with a morbidly obese patient to achieve optimal weight goals. Which statement best describes the nature of this agreement?
a. "This agreement forms a legal bond between the two of us to achieve your weight goals."
b. "This agreement will motivate the two of us to do what is necessary to meet your weight goals."
c. "This agreement will help us determine what learning outcomes are necessary to achieve your weight goals."
d. "This agreement will limit the scope of the teaching session and make stated weight goals more attainable."

. A nurse in the diabetes clinic initiates education for a patient with a new diagnosis of diabetes. The nurse notes the

patient has completed 2 years of college. What action does the nurse select for the initial teaching session?

a. Providing the patient with handouts related to blood-glucose management
b. Demonstrating the use of the blood-glucose monitor and tool to record blood-glucose readings
c. Assessing the patient's knowledge of diabetes and their ability to interpret the health information
d. Explaining the dietary restrictions including foods that are prohibited

. The nurse coach at a cardiac rehabilitation office is meeting with a patient who has learned they have heart failure. Which nursing actions might the nurse coach include in coaching sessions for this patient? (Select all that apply.)

a. Provide education based on the patient's personal goals.
b. Explore the patient's readiness for change.
c. Assist the patient to determine progress toward goals.
d. Direct the patient to exercise daily.
e. Identify goals for the patient.

ANSWERS WITH RATIONALES

. **b.** Teaching first aid is a function of the goal to prevent illness. Promoting health involves helping patients to value health and develop specific health practices that promote and maintain wellness. Restoring health occurs once a patient is ill, and teaching focuses on developing self-care practices that promote recovery. When facilitating coping, nurses help patients come to terms with whatever lifestyle modification is needed for their recovery or to enable them to cope with permanent health alterations.

. **c, d, e.** Successful teaching plans for older adults incorporate extra time, short teaching sessions, accommodation for sensory deficits, and reduction of environmental distractions. Older adults also benefit from instruction that relates new information to familiar activities or information. School-aged children are capable of logical reasoning and should be included in the teaching–learning process whenever possible; they are also open to new learning experiences but need learning to be reinforced by either a parent or health care provider as they become more involved with their friends and school activities. Teaching strategies designed for an adolescent patient should recognize the adolescent's need for independence, as well as the need to establish a trusting relationship that demonstrates respect for the adolescent's opinions.

. **c.** The Teach-Back Method tool is a method of assessing literacy and confirming that the learner understands health information received from a health professional. The Ask Me 3 is a brief tool intended to promote understanding and improve communication between patients and their providers. The NVS is a reliable screening tool to assess low health literacy, developed to improve communications between patients and providers. The TEACH acronym is used to maximize the effectiveness of patient teaching by *t*uning into the patient, *e*diting patient information, *a*cting on every teaching moment, *c*larifying often, and *h*onoring the patient as a partner in the process.

. **b, d, f.** Affective learning includes changes in attitudes, values, and feelings (e.g., the patient expresses renewed self-confidence to be able to give up drinking). Cognitive learning involves the storing and recalling of new knowledge in the brain, such as the learning that occurs during a lecture or by using a pamphlet for teaching. Learning a physical skill involving the integration of mental and muscular activity is called psychomotor learning, which may involve a return demonstration of a skill.

. **a.** Demonstration of techniques, procedures, exercises, and the use of special equipment is an effective patient-teaching strategy for a skill. Lecture can be used to deliver information to a large group of patients but is more effective when the session is interactive; it is rarely used for individual instruction, except in combination with other strategies. Discovery is a good method for teaching problem-solving techniques and independent thinking. Panel discussions can be used to impart factual material but are also effective for sharing experiences and emotions.

. **b.** The nurse cannot assume that the patient has actually learned the content unless there is some type of proof of learning. The key to evaluation is ensuring the learner meets the outcomes stated in the teaching plan, in this case, by demonstrating the psychomotor skill.

. **a.** A nurse coach establishes a partnership with a patient and, using discovery, facilitates the identification of the patient's personal goals and agenda to lead to change rather than using teaching and education strategies with the nurse as the expert. A nurse coach explores the patient's readiness for coaching, designs the structure of a coaching session, supports the achievement of the patient's desired goals, and with the patient determines how to evaluate the attainment of patient goals.

. **d.** This answer communicates respect and sensitivity to the patient's needs and offers an opportunity to discuss their feelings with the nurse or another health care professional. The other answers do not allow the patient to express their feelings and receive the counseling they need.

. **b.** Short-term counseling might be used during a situational crisis, which occurs when a patient faces an event or situation that causes a disruption in life, such as a flood. Long-term counseling extends over a prolonged period; a patient experiencing a developmental crisis, for example, might need long-term counseling. Motivational interviewing is an evidence-based counseling approach that involves discussing feelings and incentives with the patient. A caring

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

nurse can motivate patients to become interested in promoting their own health.

- **b.** A contractual agreement is a pact two people make, setting out mutually agreed-on goals. Contracts are usually informal and not legally binding. When teaching a patient, such an agreement can help motivate both the patient and the teacher to do what is necessary to meet the patient's learning outcomes. The agreement notes the responsibilities of both the teacher and the learner, emphasizing the importance of the mutual commitment.
- **c.** While the nurse takes the patient's level of education into account when providing teaching, the first step is assessing the patient's knowledge and readiness to learn. The nurse would not provide handouts or AV material without reviewing the information and assessing the patient's understanding. Discussing or demonstrating psychomotor skills, an intervention, is performed after assessment.
- **a, b, c.** The nurse coach facilitates change or development that assists the individual to cope with health challenges. The nurse coach establishes a partnership with the patient to support the patient to identify and work toward the patient's personal agenda and goals; nurse coaches do not use teaching and other strategies directed by the nurse as an expert. A, b, and c are patient-driven, person-centered interventions to educate and empower the patient. D and e are interventions identified and directed by the nurse, not by the patient, which is not part of the coaching process.

Leading, Managing, and Delegating

Rehema Kohls

Rehema is a college sophomore who comes to the health care center requesting information about sexually transmitted infections (STIs). During the visit, she says, “So many of my friends are concerned about STIs. They all say we should start a group on campus to discuss this problem, and they want me to set it up and be the leader. But I wouldn’t know where to start or what to do!”

Stephen Wall

Stephen, a 65-year-old widower who lives alone, is admitted to the intensive care unit after an automobile accident in which he sustained trauma to the head, chest, abdomen, and lower extremities. He is being monitored continuously via numerous invasive devices and requires complex care. His closest family member, a 40-year-old son, lives approximately 75 miles away.

Jack Camp

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Jack, a middle-aged single man with a history of diabetes mellitus, is receiving care for a compound fracture of his left lower extremity being treated with an external fixator. His adherence to his diabetic therapy regimen is questionable; he states, “I really love my sweets!” The patient frequently voices loud complaints about his room, the food, and the hospital routine. He also uses his call light very frequently, stating, “I just want to see if it’s working and if the nurses will come check on me.”

Learning Outcomes

After completing the chapter, you will be able to accomplish the following:

. Identify the qualities, four skills, and differing styles of leaders.
. List the five managerial functions.
. Discuss the difference between leadership and management.
. Discuss the significance of Magnet recognition for a health care organization.
. Summarize the steps in the process of change.
. Describe areas in which beginning nurses can develop leadership skills.
. Recognize the responsibilities associated with the delegation of nursing care.
. Describe the role of a mentor.

Nursing Concepts

Leadership and management

Key Terms

autocratic leadership
care coordination
clinician burnout
conflict engagement
conflict management
decentralized decision-making process
delegation
democratic leadership
emotional intelligence
explicit power
implied power
just culture
laissez-faire leadership
leadership
management
planned change
power

quantum leadership
servant leadership
shared governance
transactional leadership
transformational leadership

Today's health care providers are experiencing challenges such as fiscal constraints, workforce shortages, increased sophistication of health care consumers, and technologic and pharmacologic advances. Never before has there been such a need for nurses to work competently and collaboratively with other health care professionals to deliver accessible, cost-effective, high-quality health care to all. Although nurses may assume leadership roles by virtue of their positions, they only become effective leaders over time by understanding the complexities of coordinating care, remaining open to differing points of view, and understanding the interdependency of the entire health care team (see Chapter 12 for more on Interprofessional Collaboration and the Reflective Practice box on page 244).

Leadership and management are intertwined, but leadership roles differ from management tasks or functions. In *The Seven Habits of Highly Effective People,* Covey (1999) clarified the difference, citing a quote from Peter Drucker: "Management is doing things right; leadership is doing the right things." This suggests that leadership involves philosophy, perception, and judgment, whereas management tasks are the core of the management role (Stachowiak & Bugel, 2013). A supportive leader uses strategies that facilitate the delivery of safe, high-quality patient care in a positive environment.

Now, more than ever, it is important for nursing as a profession to be self-directed as it charts its future. The American Nurses Association (ANA) recommends recognition and reimbursement for the role that nurses play in providing effective **care coordination**. This core competency for registered nurses (RNs) has a positive impact on patient outcomes and the quality of care and reduces health care costs through more efficient use of resources. Then ANA president, Cipriano (2017), reflecting on the challenging political situation in the United States, suggested that we nurses will persevere by keeping our values, principles, and ethical practice at the forefront; staying true to our mission; and being strong advocates. "I have confidence in our moral compass and ANA's vision and new strategic plan to strengthen our profession, our voice, and our ability to advocate for all health care consumers as well as the 3.6 [now 3.9] million nurses who rely on us in this, and in any, time of change" (www.nursingworld.com).

LEADERSHIP

The concept of leadership is one of the most researched, studied, and debated fields of inquiry. **Leadership** has been described as the ability to direct or motivate a person or group to achieve set goals. Effective leaders in groups or systems do this by encouraging others to be their best selves as they work collaboratively in the pursuit of common organizational or unit goals. Brene Brown states that a leader is anyone who takes responsibility for finding the potential in people and processes and who has the courage to develop that potential. "Leadership is not about titles or the corner office. It's about the willingness to step up, put yourself out there, and lean into courage. The world is desperate for braver leaders. It's time for all of us to step up" (https://daretolead.brenebrown.com/).

Leaders have power, whether explicit or implied. For example, elected class leaders have **explicit power** by virtue of their position. However, students in the class with no designated leadership position may, by force of their personality, have more power to influence the class than designated leaders; this is **implied power**.

Consider **Jack Camp**, the patient described in the Reflective Practice scenario. The patient assumed a position of "running things in his business," thus having the explicit power of his position. In addition, the patient used "implied power" while hospitalized to exert control over his situation. The nurse's understanding of power would be important in developing a plan to deal with the patient's behavior.

Power to influence a group depends on the person's leadership style and how the person fulfills leadership

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

responsibilities. The dynamics of leadership involve applying that power for personal or organizational growth or change. Nurses who use leadership skills can become proficient in effecting desired changes in many areas, including their patients' health patterns, the health care facility, the community, the nursing profession, and the health care system in general.

Leadership Qualities

Most people admire a charismatic, dynamic, enthusiastic, visionary leader who is poised, confident, and self-directed. When you read these characteristics, who comes to your mind? Not everyone can be as dynamic and inspirational as such individuals, yet leaders do need to be comfortable with themselves (i.e., have a positive self-image) and present themselves as role models for followers. Ideally, they also have a vision that energizes the group and brings forth the best efforts of members. Critical thinkers and responsible decision makers commit high energy to achieving goals and are skilled in enlisting support and cooperation.

QSEN Reflective Practice: Cultivating QSEN Competencies

CHALLENGE TO ETHICAL AND LEGAL SKILLS

While in a clinical rotation in my junior year, I was assigned the dreaded Jack Camp (I still remember his name). He was a middle-aged single man receiving care for a compound fracture of his left lower extremity being treated with an external fixator. He had a bad case of diabetes, and an even worse sweet tooth. Before I even met him, the nurses on the floor were saying things like "good luck," which made this junior nursing student extra paranoid (although I was grateful for the warning). The patient was known for voicing loud complaints about his room, the food, and the hospital routine. He also was using his call light very frequently. The nurses called him names and discussed their dislike of him in the nurses' station, which was in the center of the unit.

As the day progressed, I found out that all this patient wanted was some attention, because he was used to running things in his business. I actually found him entertaining.

Thinking Outside the Box: Possible Courses of Action

- Ignore the comments of the other nurses on the floor, hoping that no one else hears them.
- Report the nurses to my clinical instructor, possibly causing tension on the floor.
- Politely tell the nurses to keep it down and refrain from talking about the patient, risking my own comfort level; after all, I am only a visiting student—what do I know?

Evaluating a Good Outcome: How Do I Define Success?

- Act as a patient advocate despite my limited power, which means correcting unethical behaviors as cordially as possible.
- Have the courage to go to the next level if the nurses' behavior is not corrected.
- Inform the patient politely to modify his behavior.

Personal Learning: Here's to the Future!

My response was to ignore the nurses' comments and hope no one else heard them either. I was not courageous enough to be the patient advocate that we had been taught to be. I knew my response should have been to ask them to keep it down, which would allow them to maintain their personal opinions while at the same time keeping the comments from jeopardizing patient confidentiality. From this experience, I learned that you have to be a leader, speak up, and take the risk. Part of that means being able to go against the group, risking being ostracized. In doing so, others may follow your lead, but if they choose not to follow, at least you know you advocated for your patient. Since this experience, I have not been in a situation that has challenged my personal ethics, but I have the self-confidence to believe that I can be the leader that I spoke so passionately about.

Kim Gray, Georgetown University

QSEN SELF-REFLECTION ON QUALITY AND SAFETY COMPETENCIES DEVELOPING KNOWLEDGE, SKILLS, AND ATTITUDES FOR CONTINUOUS IMPROVEMENT

How do you think you would respond in a similar situation? Why? What does this tell you about yourself and about the adequacy of your skills for professional practice? What *knowledge, skills,* and attitudes do you need to develop to continuously improve quality and safety in a situation like the one experienced by

this student nurse?
Patient-Centered Care: How could the nursing student initiate improved communication between Mr. Camp and the nurses working on his unit? Did her handling of this situation facilitate her ability to advocate for patients in similar situations? Would it be helpful to elicit Mr. Camp's preferences and expressed needs and ensure that they are included as part of the care plan?
Teamwork and Collaboration/Quality Improvement: How do you think the nursing staff would have reacted had the nursing student approached them regarding their comments about Mr. Camp? Can you think of other ways to respond? Describe a plan the nursing student could use to go about changing the staff's behavior. Which type of leadership style might have been most effective with this group?
Safety/Evidence-Based Practice: Is there anything more the nursing student could have done to contribute to a safe patient care environment, confront her fears, and promote a positive outcome in this situation? What evidence in nursing literature provides guidance for the leadership qualities necessary to enlist support and cooperation with the nursing staff in this environment?
Informatics: What information should be included in the patient handoff at the close of the student nurse's shift? Can you identify the essential information that must be available in Mr. Camp's electronic record to support safe patient care, coordination of care, and communication with staff?

Leaders value learning and must be knowledgeable. Contemporary nurse managers draw upon their own staff for clinical and organizational knowledge. Understanding the culture in your practice environment is necessary to be successful. Flexibility is a must for all nursing leaders. All nursing functions and roles require flexibility. The needs of patients, families, and the nursing team can change from minute to minute. For example, a nurse coordinator may plan to involve staff in a discussion about how best to distribute new work responsibilities, but if there are three unexpected new admissions to the unit, the discussion may need to be postponed to a quieter time.

Leadership potential is present in all nurses. With education and practice, these qualities can be developed to the point at which a nurse is skilled in the many behaviors necessary for leadership. In 2021, the ANA in *Nursing: Scope and Standards of Nursing Practice,* 4th edition, defined specific professional performance guidelines for leadership. Be sure to become familiar with the leadership competencies expected of all registered nurses. Professional nurses are accountable for these standards.

Box 10-1 offers a checklist with numerous suggestions for how you might approach the challenge of becoming a nurse leader. You can monitor your progress by periodically reviewing the checklist.

Box 10-1 Checklist for the Beginning Nurse Who Wishes to Develop Leadership Skills

Basic Attitudes and Skills

Read the statements on the right and circle the appropriate response: (1) rarely characterizes me, (2) sometimes characterizes me, and (3) often characterizes me. Then choose the behaviors and activities you would like to develop as you prepare to assume nurse leadership roles.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

1	2	3	1. I am self-directed. I know what I want and take the necessary steps to get it.
1	2	3	2. I know my strengths and limitations and feel confident with who I am and who I am becoming.
1	2	3	3. I get an idea ("vision") and energize others to help me "make it happen."
1	2	3	4. I coordinate or direct the activities of others, matching their abilities to the necessary task
1	2	3	5. I think critically about a situation without letting my feelings or those of others bias my analysis
1	2	3	6. Once I have identified a problem, I work at it until I resolve it—to the extent that this is within my power.
1	2	3	7. When I need help, I know where to find it and ask for it.
1	2	3	8. I recognize and encourage the talents of others and offer sincere compliments.
1	2	3	9. I accept responsibility for my decisions and behavior.
1	2	3	10. I accept compliments and enjoy my success.
1	2	3	11. I confront individuals who are abusing my rights or those of others in my group.
1	2	3	12. I use assertiveness techniques when defending rights.
1	2	3	13. I am flexible and can change direction once I see the value of another course of action.
1	2	3	14. I follow an appropriate chain of command when problem solving.
1	2	3	15. I question how nursing interventions might be improved.

The higher your score the better. Reread the statements where you checked "1" and see how you might plan to improve in these areas.

Beginning Execution of Leadership Role Responsibilities

Read the list of behaviors on the right and check the appropriate box met or not met.

Met	Not Met	
☐	☐	1. Recognize some personal need you have been ignoring and take steps to ensure that it is met.
☐	☐	2. Think of some group you belong to (e.g., school, work, church, or social) whose members' needs are not being met, and plan with other members to tackle the problem.
☐	☐	3. Recognize the special advocacy needs of a patient you believe is being underserved by the health care system. Become an advocate for this patient.
☐	☐	4. Find a nursing research study that recommends a specific type of care for one of your patients. Implement the recommendation and compare your findings with those of the researchers. Work collaboratively with the interdisciplinary team to implement needed changes.
☐	☐	5. Join a professional nursing organization and become an active member; Play a leadership role in your student nursing organization or other college association or group.
☐	☐	6. Analyze the media's portrayal of nurses in a specific television program, film, or book. Talk with a friend about how this portrayal of nursing influences your profession. Share your comments with the producer or author.
☐	☐	7. Contact your legislator to share your views about pending legislation. See Chapter 7.
☐	☐	8. Think about leaders you admire and respect; interview current nursing leaders; develop a plan for personal professional growth and development.
☐	☐	9. Develop a mentoring relationship with a nursing leader.

Recall **Rehema Kohls**, the college sophomore considering starting a campus group on STIs. The nurse would apply knowledge of leadership qualities when helping Rehema to decide about leading the group. In addition, the nurse would demonstrate these qualities when interacting with Rehema.

Personal Leadership Skills

Nurses recognize key qualities that are vital for a successful leader. The following list includes basic skills needed for nursing leadership and is not meant to be all inclusive, but instead to serve as a basis for development (Sherman, 2012b):

- Commitment to excellence
- Problem-solving skills, including a clear vision and strategic focus, that allow movement forward toward a creative solution (see the Nursing Advocacy in Action display)

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

- Commitment to and passion for your work
- Trustworthiness and integrity
- Respectfulness
- Accessibility
- Empathy and caring
- Desire to be of service
- Responsibility to enhance the personal growth of all staff

The ability to know yourself is the cornerstone of success in either implicit or explicit leadership roles. In a *Harvard Business Review* article, Drucker (1999), a scholar of leadership, wrote that to be successful in our current knowledge culture (of which nursing is a part), one must possess self-knowledge. With self-knowledge, we can place ourselves in positions in which we can make the greatest contribution. In terms of nursing leadership roles, this translates into formal authority of position, such as a unit coordinator or director, or a clinical leader without a formal title (Box 10-2).

Box 10-2 Personal Inquiries for Determining Complementary Leadership Roles and Working Environments

- **Identify your strengths:** Continually improve the things you do best. Discover your "intellectual arrogance" (being bright is no substitute for knowledge). Work on acquiring the skills and knowledge you need to fully realize your strengths. Remedy your bad habits.
- **Evaluate how you accomplish work:** We all work in ways that yield the best results for us. Are you a visual or auditory learner? Do you learn best by reading or writing? Do you work more productively in teams or alone? Are you more productive as a decision maker or as an advisor?
- **Clarify your values:** Working in an organization or on a unit whose value system is unacceptable or incompatible with yours will lead to frustration and poor performance. Identify your values and seek a work environment that is complementary, not adversarial.
- **Determine where you belong and what you can contribute:** In small or large organizations, as a decision maker or as an advisor, prepare for opportunities that emerge in response to these queries. In this dynamic industry, set reasonable short- to medium-range goals.
- **Assume responsibility for relationships:** Cultivate relationships and analyze the differences you may have with others. Know and understand the strengths, performance modes, and values of your coworkers and managers.

Think back to **Rehema Kohls**, the college sophomore who is thinking about starting a campus discussion group on STIs. The nurse would incorporate knowledge of Drucker's identified need for self-knowledge and personal inquiries when helping Rehema decide about starting and leading the group.

Emotional Intelligence

Goleman (2005) defines **emotional intelligence** in its simplest terms as the ability or skill to be intelligent about emotions, our own and those of others. If you want to be successful as a leader, you will want to reflect on your ability to use your emotional intelligence to help yourself and others achieve valued goals. As you read about the four attributes below, use your self-assessment skills to determine which you can claim as strengths and which need more work.

. **Self-management:** You're able to control impulsive feelings and behaviors, manage your emotions in healthy ways, take initiative, follow through on commitments, and adapt to changing circumstances.
. **Self-awareness:** You recognize your own emotions and how they affect your thoughts and behavior. You know your strengths and weaknesses and have self-confidence.
. **Social awareness**: You have empathy. You can understand the emotions, needs, and concerns of other people; pick up on emotional cues; feel comfortable socially; and recognize the power dynamics in a group or organization.
. **Relationship management:** You know how to develop and maintain good relationships, communicate clearly, inspire

and influence others, work well in a team, and manage conflict.

Leadership Styles

Many different styles of leadership are present in contemporary health care settings. The complexity and persistent, rapid change in health care drive many of the leadership styles that you will observe. It is helpful to think of leadership as a behavior, as something one person does to influence another. This influence takes many forms and requires much creativity, intellect, and savvy. Different styles are applicable in different contexts and with different levels of employees. Some of these styles are explained in the next section. New graduates should carefully choose organizations that match their preferred leadership style.

Nursing Advocacy in Action

Patient Scenario

Everybody loves Sarah. Mature for her 9 years, Sarah has advanced leukemia, and her only medical hope now is to transfer to a hospital 3,000 miles from home that has the bone marrow that she needs. There are, however, several problems.

. Sarah's family is homeless and visits rarely. She makes excuses for them—saying how hard it is to be on the street and always trying to find shelter—but she couldn't hide her disappointment when no one visited on Christmas and her birthday. You have met the parents and were struck by their immaturity.
. Sarah's health care provider is working passionately to get Sarah to the transplant center; the latest hurdle is ensuring that they will accept her given the fact that the family has no insurance or finances.
. Many of Sarah's professional caregivers aren't sure that the bone marrow transplant is a good idea. It is doubtful the funds would be found to send any of her family with her, and the possibility exists that, if unsuccessful, she could die at the transplant center surrounded by strangers.

You mention these concerns to Sarah's doctor, who replies, "But this is her only hope for cure!"

Implications for Nursing Advocacy

How will you respond if you are Sarah's nurse? Talk with your classmates and experienced nurses about the questions that follow.

- If you elect to advocate for Sarah, what practical steps can you take to ensure better health outcomes?
- What is it reasonable to expect of a student nurse, a graduate nurse, and an experienced nurse in this situation?
- What advocacy skills are needed to effectively respond to this challenge?

Autocratic Leadership

Autocratic leadership, also called directive leadership or authoritarian leadership, involves the leader assuming control over the decisions and activities of the group. It is often an efficient process, yet many people may resent this leadership approach when it is used regularly. Staff and team members have limited opportunity to contribute suggestions and participate in organizational decisions. High staff turnover and burnout are more common with this style of leadership.

Consider **Stephen Wall**, the 65-year-old patient in the intensive care unit. The nurse would demonstrate autocratic leadership to perform specific care activities and to delegate responsibilities to appropriate personnel.

Many experienced nurses are used to working under autocratic leaders because this approach was used in most hospitals in earlier years. It may have evolved from nursing's historical military and religious past, or from the industrial

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

model of command and control prevalent in many organizations. Although some health care workers still respond best to the directive approach, this style of leadership is gradually being replaced by the democratic style of leadership as nurses demand and receive more say in decision making.

Some situations may require an autocratic leadership style. For example, Nurse A discovers that one of her patients is bleeding excessively from his surgical incision. She knows that he needs immediate attention, so she gives specific orders to another team member to attend to the other patients. She tells the RN on her team to call the surgical resident to come as soon as possible. She implements a nursing care plan to prevent further blood loss or complications. Nurse A assumed the autocratic style of leadership in this situation so that all necessary tasks would be accomplished immediately. Although she rarely uses this style, she implemented it effectively in this emergency situation. This example illustrates that leadership is context dependent.

Democratic Leadership

Democratic leadership, also called participative leadership, is characterized by a sense of equality among the leader and other participants. Decisions and activities are shared. Participants are encouraged to develop their skills and strengths within the group. The group and leader work together to accomplish mutually set goals and outcomes. As professionals, nurses generally respond well to this style of leadership when they are the followers and feel more comfortable when they are the leaders of democratic groups. Group satisfaction and motivation are excellent benefits of this style. In situations in which a rapid response is essential, however, a democratic approach to leadership that requires gathering the input of team members may slow decision making.

Recall **Stephen Wall**, the patient in the intensive care unit. The nurse would use democratic leadership to work collaboratively with other health care disciplines to plan the most effective care for the patient. For example, the nurse may need to work with the surgical and neurologic staff, respiratory therapy, physical therapy, and social services in developing the patient's care plan.

An example of democratic leadership follows. Nurse B, a head nurse, observes that staff members have not been documenting patient teaching and learning in their progress notes. Nurse B is not sure why this is occurring but believes that this problem must be solved. He calls a staff meeting and leads a discussion to seek information on possible causes and solutions. Nurse B decides that staff members need to be included in the problem-solving approach. He thinks the staff will be more motivated to document their teaching and the patients' learning if they have a say in what changes in practice are necessary and how they will be implemented. Nurse B has used the democratic style of leadership and **decentralized decision-making process** to resolve this issue.

Laissez-Faire Leadership

In **laissez-faire leadership**, also called nondirective leadership, the leader relinquishes power to the group, such that an outsider could not identify the leader in the group. This approach encourages independent activity by group members. This style depends on the strengths of followers to direct the group activities. It is most effective when all staff are clinical experts with a deep understanding of both clinical and administrative processes. This style is rarely useful because task achievement is difficult when each nurse is working independently, and the staff on most units and departments have varying levels of clinical maturity. However, it can be used effectively when the leader wants a problem to be solved completely by expert staff group members.

Consider **Stephen Wall**, the patient with multiple trauma who is in the intensive care unit. The patient has multiple priority needs, requiring interdependent actions of many people. Use of laissez-faire leadership would not be effective in this situation.

Similarly, one of the greatest failings of nursing leadership is leaving every nurse, every shift, to figure out how best to respond to Jack Camp's behaviors, rather than planning together and facilitating what a team based "best" response looks like.

Servant Leadership

The Robert K. Greenleaf Center for Servant Leadership (https://www.greenleaf.org) defines **servant leadership** as a philosophy and set of practices that enriches the lives of individuals, builds better organizations, and ultimately creates a more just and caring world. It begins with the natural feeling that one wants to serve. Greenleaf recognized that, although some prize leadership because of their love for power and material possessions, others aspire to leadership because of wanting to serve:

> The difference manifests itself in the care taken by the servant first to make sure that other people's highest priority needs are being served. The best test, and most difficult to administer, is: Do those served grow as people? Do they, while being served, become healthier, wiser, freer, more autonomous, more likely themselves to become servants? And what is the effect on the least privileged in society? Will they benefit or at least not be further deprived?

Box 10-3 **Five Key Practices for Servant Leaders**

1. **Develop your vision.** What do you see in the future, related to a current or anticipated need? A leader's vision inspires and motivates others to follow and to engage.
2. **Listen and learn before speaking and acting.** Be mindfully present with others, learning and assessing their concerns, values, and priorities. Have an open mind and leave all judgment and assumptions behind.
3. **Envision and invest in others' greatness.** What do you see in others? How can you help them grow?
4. **Give away your power.** Allow others to have a voice, to exercise control, and to practice leading themselves, reassured by the knowledge that you have their backs.
5. **Build community by developing strategic relationships.** Invest in those who support the organization's values, show passion, can play to their strengths, and demonstrate a positive attitude. Provide ongoing opportunities for collaborations, sharing, reflection, encouragement, and celebration, as well as hard work

Source: Inspired by Fahlberg, B., & Toomey, R. (2016). Servant leadership: A model for emerging nurse leaders. *Nursing, 46*(10), 49–52; adapted from Boone, L. W., & Makhani, S. (2012). Five necessary attitudes of a servant leader. *Review of Business, 33*(1), 83–96. Used with permission.

Relationships are the key to successful servant leadership. It is easy to see why many nurses find servant leadership a great fit with nursing values, roles, and responsibilities. Fahlberg and Toomey (2016) believe that many of the best nursing leaders practice servant leadership. "We lead, speak up, volunteer, and advocate because it is the right thing to do. We want to make something better. We see a wrong and we want to make it right, so we do something. Soon, others join in, becoming leaders as they learn and grow through their service" (p. 50). Box 10-3 presents five key practices for servant leaders.

Quantum Leadership

Porter-O'Grady and Malloch (2003), in *Quantum Leadership: A Textbook of New Leadership,* argued that leaders must move beyond the traditional modes used by all levels of workers. They, like Drucker (1999) and others, focused on the impact of the information age, identified at the turn of the century, on work and workers. The vertical command and control structures that generated the leadership styles previously mentioned are no longer useful for managers and workers, nor do they yield productivity for organizations. The explosion of information and technology in health care, as

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

in other industries, has spawned, by necessity, the "knowledge worker." This social transformation is affecting aspects of all our lives, including, perhaps most importantly, how we lead and manage our organizations.

We are in a difficult transition period between the old and the new. In the old, change was viewed as an entity to be planned, carefully managed, and accepted. In the new "quantum age," change is conceived as dynamic, ever present, and continually unfolding. We are forced to experience change at the same time we perceive it, with little or no opportunity to definitively and laboriously plan and manage it. **Quantum leadership** theory views an organization and its members as interconnected and collaborative—a helpful approach when unpredictable events and changing environments present themselves (Curtin, 2013). Nursing leaders can model these new behaviors by combining these new attributes with the requisite technical skills. Never was this more needed than when the 2020 pandemic stretched all our resources thin.

Transactional Leadership

Transactional leadership style is based on a task-and-reward orientation. Team members agree to a satisfactory salary and working conditions in exchange for commitment and compliance to their leader. Health care organizations have often used transactional leadership strategies to provide direction and recognize employees' progress in meeting pre-established goals and work deadlines. Transactional leaders maintain control by rewarding good behavior and punishing behavior they perceive as detrimental or negative. Employees have minimal opportunities for creative thinking and involvement in organizational decisions, and employer and employee may not share a common vision. Transactional leaders provide little inspiration for nurses to participate in reforming health care, problem solving, or engaging in practices and research that promote nursing excellence (Habel & Sherman, 2012).

Transformational Leadership

Transformational leadership can create revolutionary change. Often described as charismatic, transformational leaders are unique in their ability to inspire and motivate others. They create intellectually stimulating practice environments and challenge themselves and others to grow personally and professionally, and to learn. Gifted in creating a common vision, they demonstrate passion for their vision and keep others similarly focused. One of the unique qualities of transformational leaders is their vulnerability. They communicate honestly and openly and can express emotions as well as ideas as they share themselves with others. They show concern and care for others and are willing to take risks. They pay attention to process as well as outcomes.

An example of transformational leadership is as follows. Nurse C is troubled by the plight of women and children in the city where she lives. She unites with other nurses and health care professionals to design and implement strategies to meet their needs. Within 18 months, a nursing center is funded and running, improving maternal–child outcomes in the area. The founding group of health care professionals continues to meet monthly to dream about future strategies and to support each other in their work. They are proudest of the improved self-esteem and independence in many of the women they serve.

Transformational leaders have a positive and compelling vision, fostering a new culture for nursing practice and patient care. This style of leadership is a key component of organizations that achieve Magnet status.

DEVELOPMENT OF THE MAGNET RECOGNITION PROGRAM

More than two decades ago, the Task Force on Nursing Practice in Hospitals of the American Academy of Nursing (AAN) conducted a study of 41 hospitals to identify and describe variables that created an environment that attracted and retained well-qualified nurses who promoted quality patient care through providing excellence in nursing services. These institutions were called "Magnet" hospitals because they attracted and retained professional nurses who experienced a high degree of professional and personal satisfaction through their practice. These institutions used a decentralized decision-making process, self-governance at the unit level, and respect for and acknowledgment of professional autonomy.

In 1990, the American Nurses Credentialing Center (ANCC), a subsidiary of ANA, developed a formal process to recognize excellence in nursing service and to confer "Magnet" status. Magnet status is awarded for 4 years, after which organizations must reapply. Originally, 14 characteristics, called the Forces of Magnetism, were recognized that identified quality patient care, excellent nursing care, and innovations in professional nursing practice. A statistical analysis and review of evaluators' reports has resulted in the configuration of the original 14 attributes into five model components, effective in 2009:

- Transformational leadership
- Structural empowerment
- Exemplary professional practice
- New knowledge, innovation, and improvements
- Empirical quality results

This new model includes the original 14 forces but reflects a greater focus on measuring outcomes and eliminates redundancy in documentation.

SIGNIFICANCE OF MAGNET RECOGNITION

Achieving Magnet status serves patients, nurses, and health care organizations. It empowers organizations to:

- Attract and retain top talent
- Improve care, safety, and satisfaction
- Foster a collaborative culture
- Advance nursing standards and practice
- Grow business and financial success

https://www.nursingworld.org/organizational-programs/magnet/Research and surveys provide evidence that Magnet hospitals have better patient outcomes, shorter lengths of stay, higher patient satisfaction, and higher nurse job satisfaction and nurse retention than hospitals without this governance style of leadership (ANCC, 2013; Habel & Sherman, 2012; Hawkins & Shell, 2012). The achievement of Magnet status has a profound impact on the quality of patient care and nursing practice. According to Bashaw (2011), Magnet recognition has become the "apex of achievement for nursing professionals and health care organizations." More than 400 hospitals have achieved Magnet status. Additional information regarding the Magnet Recognition Program is available at the ANCC at https://www.nursingworld.org/organizational-programs/magnet/.

IMPLEMENTATION OF A "JUST CULTURE"

Health care organizations that achieve Magnet status have created a focus on positive patient care outcomes, collaboration, shared decision making, and a climate in which patient safety is a priority. Creation of a **just culture** indicates an organizational commitment to accountability and universal safety in health care. Nurses are encouraged to disclose clinical errors and potential error situations without the fear of punitive actions. This accountability then allows other nurses to learn from this experience. The open communication resulting from development of a just culture allows health care workers to discuss concerns and challenges related to patient care and turn them into opportunities for improvement. The combination of Magnet principles and a just culture can produce a health care vision focused on transparency, accountability, communication, collaboration, and the pursuit of health care excellence (Bashaw, 2011; Bashaw et al., 2012; Shepard, 2011). Read more about just culture in Chapter 7.

MANAGEMENT

All nurses, to the extent that they work with others and influence others to be their best, can become leaders. However, some nurses hold positions in the health care system that also make them managers. The role of **management** is to plan, organize, direct, and control available human, material, and financial resources to deliver quality care to patients and families.

The managerial role is frequently conceptualized as the technical dimension of formal leadership roles. These technical areas of expertise, particularly in the financial or clinical resource management dimension, are mandatory for contemporary nurse managers. A few of their direct responsibilities, identified in a previous section, can be viewed in these traditionally broad areas (Marquis & Huston, 2017):

- *Planning:* identifying problems and developing goals, objectives, and related strategies to meet the demands of the clinical arena
- *Organizing:* acquiring, managing, and mobilizing resources to meet both clinical and financial objectives
- *Staffing:* hiring, orienting, scheduling to facilitate team building; also includes staff development
- *Directing:* leading others in achieving goals within the constraints of the current fiscal and workforce shortage scenarios, a demanding task for managers and staff alike
- *Controlling:* implementing mechanisms for ongoing evaluation, particularly in areas of clinical quality and financial accountability

Remember **Jack Camp**, the patient with diabetes and an external fixator. The nurse manager for this unit could address the problem of the staff's overt criticism of the patient. Using planning, organizing, directing, and controlling, the nurse manager could ultimately create an environment that is conducive to the patient's recovery and health and satisfying to staff caring for this patient.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

It is increasingly challenging for the nurse manager to be both a clinical and a managerial expert; the explosion of clinical knowledge and expectations for managerial expertise place unrealistic demands on this role (Shingler-Nace & Gonzalez, 2017). Typical nurse managers are expected to manage their unit budget within prescribed constraints, deliver a high level of quality care to patients on the unit, develop and serve as mentors for junior staff, comply with regulatory requirements, and be experts at human resource management. Although the role might seem overwhelming, it can also be quite satisfying to the manager, the staff, and the organization. Collaboration and appropriate support from both superiors and subordinates can empower and motivate staff, facilitating a highly functioning team and best practice clinical environment.

Marquis and Huston (2017) caution that management and leadership should be intertwined for each to be effective. Some view leadership as an expected function of management, while others consider leadership as more complex, with an emphasis on improving productivity and empowering the workforce rather than just controlling specific organizational details. However, a leader without management skills can cause chaos in an organization, while a manager who fails to lead is equally ineffective. Nurse managers must be effective leaders to be successful. Nurse managers who cannot create a healthy group environment; who fail to resolve interpersonal issues that lower morale and result in numerous complaints from patients, nurses, and health care providers; and who cannot develop a plan to resolve detrimental interpersonal issues lack leadership skills. See Table 10-1 for a comparison of the roles and characteristics of nurse leaders and managers. What is certainly true is that both nursing leadership and management roles require passion to make health care work for those who need it, a commitment to advance the well-being of their staff, and in-depth knowledge of the field and successful strategies to achieve these aims.

Centralized and Decentralized Management Structures

In a centralized management structure, senior managers generally make decisions. Those further down in the hierarchy of the organization are often responsible for implementing decisions into which they had little input. In a decentralized management structure, on the other hand, decisions are made by those who are most knowledgeable about the issues being decided. Nurses are thus intimately involved in decisions concerning patient care. Nurse managers are accountable for what happens on their nursing unit, including patient census, staffing, supplies, and budget. A decentralized system invites greater accountability and responsibility because most nurses feel more responsible for decisions they have made themselves. Magnet facilities promote **shared governance** practices that give nurses more input and influence over their jobs and how the organization makes decisions that affect them. Every nurse brings their own wisdom, expertise, and experience that are not leveraged enough if not tapped into. Shared governance models ensure that every nurse has a voice. Especially as nursing fatigue rates rise, employers struggle to retain nurses, and nursing performance has a more direct impact on the financial bottom line of hospitals. The shared governance model is essential to ensuring that nurses are empowered to have as much influence over their work environment as possible (https://www.nursingworld.org/search/?q=shared+governance+in+nursing).

Table 10-1 Nursing Leadership and Management: A Breakdown of the Roles

ROLE	DEFINITION	KEY RESPONSIBILITIES	QUALITIES/CHARACTERISTICS
Nurse Leader	A nurse leader oversees a team of nurses and other health care professionals, making decisions and directing patient care initiatives. They have advanced clinical knowledge and are focused on improving patient health outcomes.	• Staying up to date on the latest health care research • Working to shorten the average length of patient hospital stays and reduce readmission rates • Aiming to reduce health care costs by improving efficiency • Providing team members with the knowledge and tools they need to deliver safe, top-quality care • Ordering and reviewing diagnostic tests • Developing treatment plans to improve care and patient outcomes • Providing care directly to patients • Advocating for and educating	*Nurse leaders need to communicate well with team members and efficiently delegate tasks. Empathy and compassion are a must, since they work directly with patients. Effective nurse leaders also need to have strong problem-solving and critical thinking skills.*

		patients and family caregivers • Reducing the turnover rate of registered nurses	
Nurse Manager	Nurse managers are not typically involved in direct patient care; rather, they are focused on managing daily operations and supervising staff. The position requires an understanding of business management, as nurse managers are often in charge of budgeting.	• Overseeing day-to-day operations • Supervising and providing training to team members • Working with various stakeholders to optimize care and meet budget requirements • Handling escalating situations between patients and health care providers • Designing and managing a budget • Overseeing insurance and other reimbursements • Overseeing electronic health record systems • Hiring and evaluating nursing staff • Collaborating with other managers to achieve optimal patient outcomes	*Nurse managers must be able to juggle multiple priorities, communicate effectively, and work well with various stakeholders. They should be task-oriented individuals who are also able to advocate and serve as mentors for the staff members who report to them.*

You will most likely experience both modes of decision making—centralized and decentralized—in nursing units. Financial targets and other broad strategic directions are frequently established at executive levels of the organization. Clinical issues, processes of care delivery, clinical outcomes, and unit governance are usually resolved at the unit or department level.

Conflict Management and Engagement

Nurse managers frequently encounter conflict between employees and between themselves and employees. Unresolved conflict can lower morale and threaten quality care. **Conflict management** is a process to work through conflicts in a way that minimizes negative effects and promotes positive consequences. **Conflict engagement** teaches skills to help nurses perform well in the face of conflict instead of finding a work-around to avoid conflict.

Creating connection with others is a powerful tool in conflict engagement. Gerardi (2015b) recommends the PEARLA approach. PEARLA stands for **P**resence, **E**mpathy, **A**cknowledgment, **R**eflect (or **R**eframe), **L**isten openly, and **A**sk questions. When someone is agitated, taking the time to create a connection can deescalate the situation and lessen feelings of threat. The better we understand another's concerns, wants, and needs, the more likely we are to build trust as a foundation for problem solving (Gerardi, 2015b, p. 61).

It is important for each of us to recognize our "hot buttons" and patterns under stress. Gerardi (2015a, p. 61) recommends:

- Recognizing the physical sensations we experience when triggered by a situation (flushing, increased heart rate, shallow breathing)
- Taking a step back and breathing deeply three times
- Noticing and delaying our initial response in order to stop the habit of "fixing" or "solving" a situation too quickly
- Becoming curious about what we don't know, including discerning what the other person needs

Marquis and Huston (2017) described six styles for dealing with conflict—avoiding, accommodating, competing, compromising, collaborating, and smoothing—and noted that "the situation itself, the urgency of the decision, the power and status of the players, the importance of the issue, and the maturity of the people involved in the conflict" determine which strategy is most appropriate. Box 10-4 further defines these conflict resolution strategies.

Johansen (2012) describes a nursing management situation that demonstrates these conflict resolution strategies. Nurse C, who works in an emergency department, receives her assignment and notices that Nurse J has a much lighter assignment. Nurse J has a reputation for being difficult and always getting her way. Because of the number of her assigned patients and the severity of their conditions, Nurse C approaches the charge nurse, Nurse S, and asks her to modify her assignment. Nurse S declines to change it, does not want to address this with Nurse J, and reminds Nurse C

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

how difficult Nurse J can be if confronted with an unpleasant situation. Nurse C decides to discuss this situation with Nurse P, the nurse manager. To manage this conflict, Nurse P can use one of the following strategies:

Box 10-4 Conflict Resolution Strategies

Avoiding: There is awareness of the conflict situation, but the parties involved decide to either ignore the conflict, or avoid, or postpone its resolution. The conflict has not been resolved and may resurface later in an exaggerated form.

Collaborating: This is a joint effort to resolve the conflict with a win–win solution. All parties set aside previously determined goals, determine a priority common goal, and accept mutual responsibility for achieving this goal. This focus on problem solving is based on mutual respect, honest communication, and shared decision making.

Competing: This approach results in a win for one party at the expense of the other group. This win–lose confrontation can leave the loser frustrated, with a desire to "get even" in the future. This strategy may be used when one party has more knowledge regarding the situation, or when resistance is appropriate because of ethical concerns or unsafe patient care practices.

Compromising: For this technique to be effective, both parties must be willing to relinquish something of equal value. If that does not occur, either or both parties may feel that they have lost the conflict and given up more than the other group.

Cooperating/Accommodating: One party makes a conscious decision to let the other group win and may collect an "IOU" for use in the future. This party's original loss may result in a more positive outcome in the future.

Smoothing: Smoothing is an effort to compliment the other party and focus on agreement rather than disagreement, thus reducing the emotion in the conflict. The original conflict is rarely resolved with this technique.

Source: Adapted from Marquis, B., & Huston, C. (2017). *Leadership roles and management functions in nursing* (9th ed., pp. 558–559). Wolters Kluwer Health.

- *Avoid* the situation, with the result that both Nurse C and Nurse P feel frustrated and powerless.
- Respond in a dominating or *competing* manner and tell Nurse S that the assignments are unacceptable. She intimidates Nurse S and also is upset because the nurses on the unit are not resolving their own problems.
- Ask Nurse C to accept the assignment in order to *accommodate* the charge nurse. Nurse P understands the inequity of this assignment but lets Nurse C know that she appreciates her team commitment and will remember this in the future.
- Attempt a *compromise* by providing Nurse S with a rationale for modifying the assignment. Both Nurse C and Nurse S should discuss the assignment with Nurse J and see if they can find a mutually agreeable solution.
- *Collaborate* with all parties to resolve the assignment issue and promote a safer work situation.
- Use a *smoothing* approach that involves complimenting all parties in an attempt to prevent emotional outbursts and focus on agreement.

Managing Change

Change is the process of transforming or modifying something. It might be a planned change, an unplanned change, a developmental change, or, as Porter-O'Grady and Malloch (2003) suggested, a quantum change and ever present. Nursing and the health care system are continually changing and evolving—that momentum will only escalate in the years to come. Factors such as the increasing number of chronically ill and older people, the increasing role of government and industry in health care, the rising cost of health care, and the changing patterns of health care delivery have produced a need for innovation and change in health care. Patient care safety and quality issues play a vital role in the transformation occurring in the health care system. Nurse managers, once they have assessed the need for change, function as visionary, assertive, and supportive role models in the implementation of the planned change.

Change Theory

There are many theories of change, most based on the classic theory of change proposed by Lewin (1951). Lewin identified three stages of change:

. *Unfreezing:* The need for change is recognized.
. *Moving:* Change is initiated after a careful process of planning.
. *Refreezing:* Change becomes operational.

These three rather simplistic stages do not fully reveal the very dynamic and personal nature of change of any kind. In health care, we can find numerous examples of using change theory to transform practice. Not so long ago, childbirth in the United States was routinely "medicalized." Women came to the hospital to deliver their babies; pain medications that interfered with the natural process of labor were routinely administered, necessitating forceps and assisted deliveries;

and husbands, partners, and siblings were banished from the delivery room. Nurse midwives and others recognized the need for change (*unfreezing*) and set about researching childbirth and ways to improve infant and family outcomes. After a careful process of planning (*moving*), multiple natural childbirth options in health care facilities and in the home were made available to women and couples; today they represent mainstream care (*refreezing*).

Similarly, someone who takes good health for granted may fail to develop healthy lifestyle practices until illness results in recognition of the need for change (*unfreezing*). A careful process of consultation and study may lead to the development of a well-developed fitness plan (*moving*), which ideally becomes part of the person's everyday life (*refreezing*). Effective nurses pay attention to their ability to influence the person's thinking and behavior in each stage of change.

Planned Change

Planned change is a purposeful, systematic effort to bring about change. Nurse managers most often implement planned change. The eight steps in the process of change, which are somewhat similar to the steps of the nursing process, are shown in Box 10-5. Kotter (1996) emphasized that for change to be successful, it is important to progress in sequence through each of the eight stages. Skipping any of the steps can result in the vision being sabotaged, momentum faltering, and frustration increasing for all involved in the process.

Before planning to make a change, a nurse manager should consider the following:

- What is amenable to change? Considering this question may reveal a behavior not amenable to change.
- How does the group function as a unit? Certain forces within a group may favor change, whereas other forces may resist it.
- Is the person or group ready for change and, if so, at what rate can that change be expected to be accepted? The pace of change must be consistent with the person's or group's readiness to assimilate change. Readiness involves both the ability and willingness to change. In contemporary health care organizations, change is dynamic, persistent, and very challenging. The concept of flexibility previously mentioned is put to a real test in any clinical or managerial arena.
- Are the changes major or minor? A series of small changes may be more easily accomplished than one large, dramatic change. The nursing leader/manager must support the staff during the difficult task of acquiring new skills and, frequently, new professional identities.

In today's dynamic health care environment, nurses play a pivotal role in the change process. They must be prepared to initiate and implement quality change projects. The Robert Wood Johnson Foundation and the Institute for Healthcare Improvement originated a program called Transforming Care at the Bedside (TCAB) that focuses on instituting changes to improve patient care on medical-surgical units. Nurses are empowered to address inefficiencies and changes in workflow in an effort to improve the quality of patient care. An additional change effort, the Care Innovation and Transformation (CIT) initiative, was developed by the American Organization of Nurse Executives (AONE). This program supports nurse managers and provides training and tools to ensure a successful change environment.

Box 10-5 Planned Change: An Eight-Step Process

Planned change is a purposeful, systematic effort to alter or bring about change through the intervention of a change agent. The same steps apply whether dealing with individuals or groups.

1. *Recognize symptoms that indicate a change is needed and collect data*.
2. *Identify a problem to be solved through change*. Analyze the symptoms and reach a conclusion. Note resistance or barriers to change and factors that promote the desired change.
3. *Determine and analyze alternative solutions to the problem*. Consider the advantages, disadvantages, and consequences of each alternative. An analysis of various proposed solutions to a problem may result in using a combination of alternatives.
4. *Select a course of action from possible alternatives*. Avoid initiating too many courses of action and thereby dissipating resources and energy.
5. *Plan for making the change*. This step is crucial to effect change successfully. Start by stating specific objectives, designing a plan for change, developing timetables, selecting people to assist with making the change, and anticipating how to stabilize change and deal with resistance to change. Unless a plan is clearly designed, effecting change is likely to be a chaotic experience.
6. *Implement the selected course of action to effect change*. Put the plan for change into effect. During this period, flexibility is important to adapt to unforeseen problems.
7. *Evaluate the effects of change by comparing them with objectives stated in the plan for change*. Adjustments can be made in the plan as necessary after evaluation. If the results of evaluation indicate that the course of action selected to solve a problem has been unsuccessful, an adjustment should be made or another course of action selected.
8. *Stabilize the change*. When a solution has been found, take measures to make the change permanent. Continue follow-up until the change is firmly established.

Resistance to Change

If you find yourself in a clinical setting undergoing small or big change, it can be helpful to ask yourself the following questions:

- How patient am I with myself and with others?
- Am I open to new experiences and to growth?
- Do I believe that good will come of the change? Hope is that human excellence that allows us to envision a positive future and work to bring it into being.
- Am I a positive influence on others and on our institution?

People may resist change for various reasons. You may find it helpful to locate yourself on the Fisher change curve in Figure 10-1. One nurse in the early days of orienting to a new electronic medical record shared that she found herself in all of the places on any given day! The nurse manager/leader must identify if any resistance is present in order to determine which techniques are needed to overcome it. Change alters the balance of a group, and resistance is an expected accompaniment to change.

People resist change for a number of reasons, as noted below.

THREAT TO SELF

People generally view change in terms of how they are affected personally. Personal threats may include a loss of self-esteem, a belief that more work will be required, or a belief that social relationships will be disrupted. For example, when hospitals began to use more assistive personnel (AP) for routine nursing care, many nurses resisted, not only because of quality concerns but also because they found themselves legally and professionally responsible for supervising the care given by these aides. There was also concern that some professional nurses would be replaced by AP.

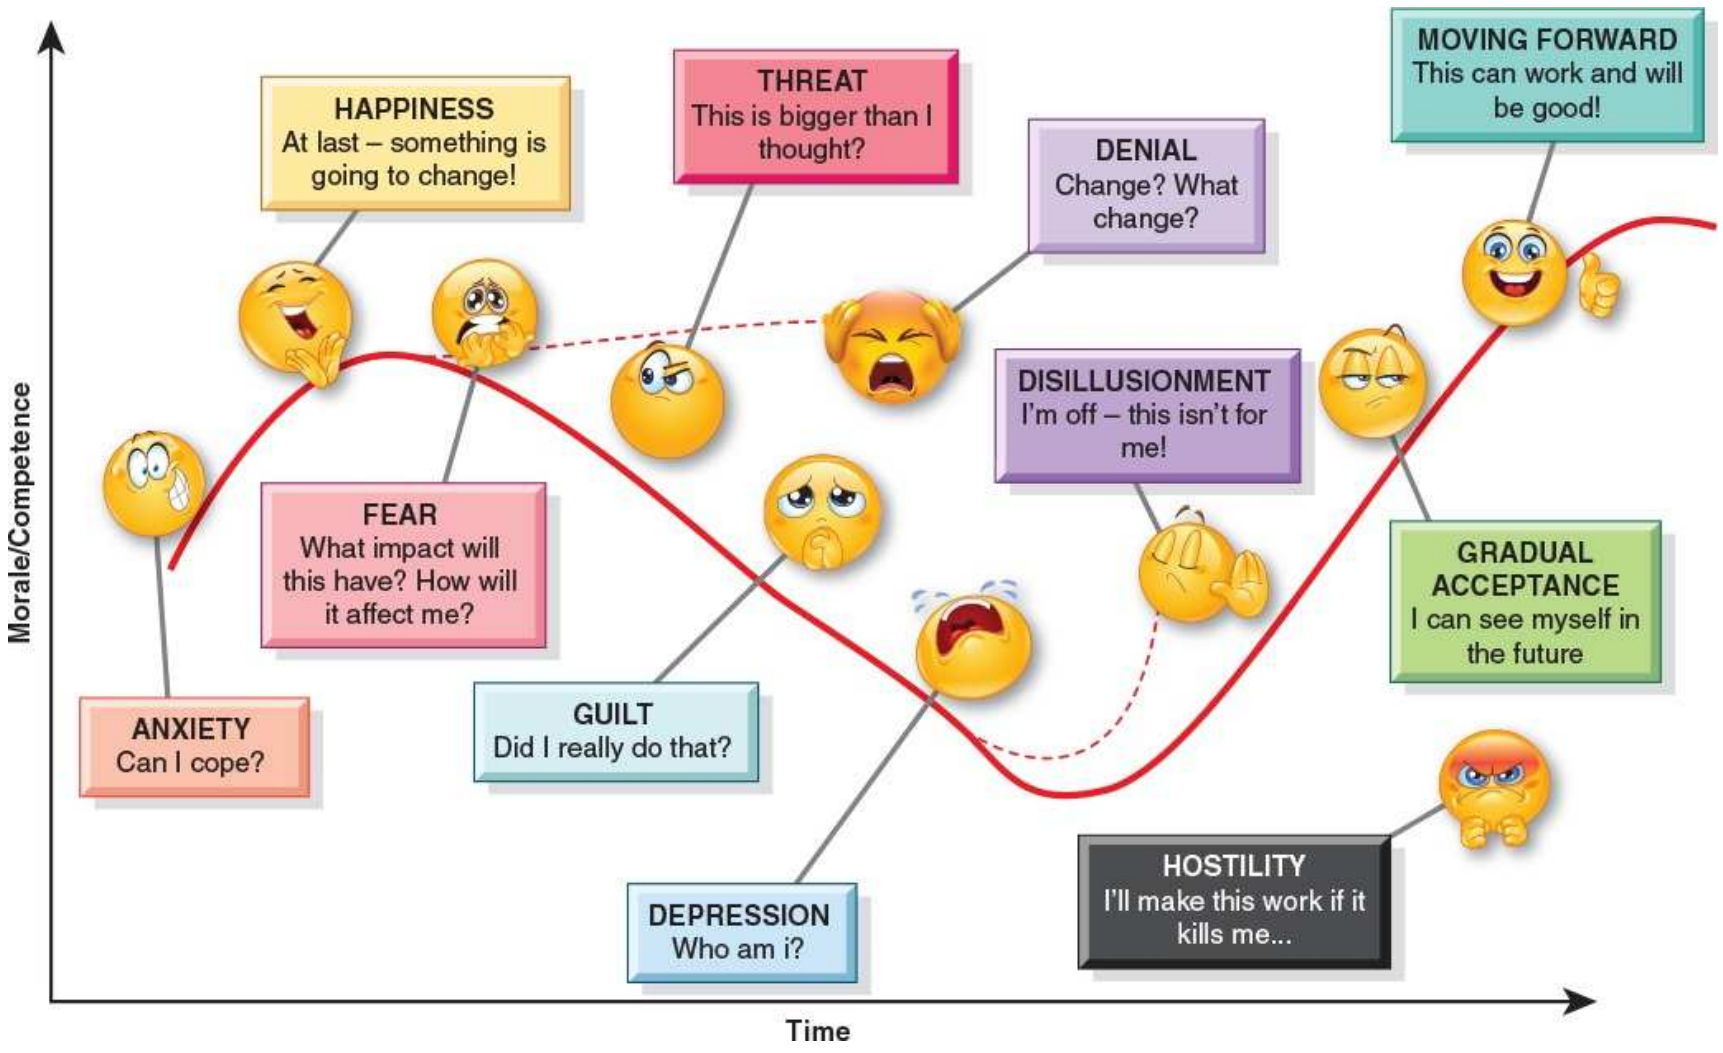

FIGURE 10-1. Fisher Change Curve. (© BusinessBalls Ltd [and J. M. Fisher] [1999/2012]. Not to be sold or published. The author(s)/Businessballs Ltd. accepts no liability for any issues arising https://www.businessballs.com/change-management/personal-change-stages-john-fisher/.)

LACK OF UNDERSTANDING

Someone who does not understand the nature of change is likely to resist. The people who will be affected by the change must become involved and educated if their resistance is to be overcome. For example, nurses who do not realize the effectiveness of using care plans tend to resist preparing them because they believe they are not beneficial for providing patient care.

LIMITED TOLERANCE FOR CHANGE

Some people simply do not like to function in a state of flux or disequilibrium. A person may understand the need for change but may be unable to cope with it emotionally. For example, a nurse may resist change because of the temporary confusion the change is likely to cause.

DISAGREEMENTS ABOUT THE BENEFITS OF CHANGE

Resistance may occur when the change agent and those resisting change have different information. If the information known by the people resisting change is more accurate and relevant than the change agent's information, resistance may be beneficial. For example, the supervisor of community health services proposes to implement, in a low-income neighborhood, a home health care plan that has been effective in a middle-class section of the city. The nurse in charge of the health program in the low-income area resists, believing that the same plan would not be successful in a financially and educationally disadvantaged neighborhood.

FEAR OF INCREASED RESPONSIBILITY

Many people are worried about having to take on more complex responsibilities, especially if they feel unprepared for the planned changes. The changes may seem overwhelming, so they naturally resist them.

Overcoming Resistance to Change

Resistance can be subtle or distinct, gentle or aggressive. Responding to resistance is both a leadership responsibility and a challenge in which the leader uses leadership qualities, leadership style, and knowledge of group dynamics to influence others toward a desired outcome. Nurses acting as change agents find the following guidelines helpful for overcoming resistance to change:

- Explain the proposed change to all affected people in simple, concise language.
- List the advantages of the proposed change, both for the individual and for members of the group.
- Relate the proposed change to the person's or group's existing beliefs and values.
- Help overcome resistance by providing opportunities for open communication and feedback.
- Indicate clearly how the change will be evaluated.
- If possible, introduce change gradually. Involve everyone affected by the change in the design and implementation of the process.
- Provide incentives for commitment to change, such as money, status, time off, or a better working environment.

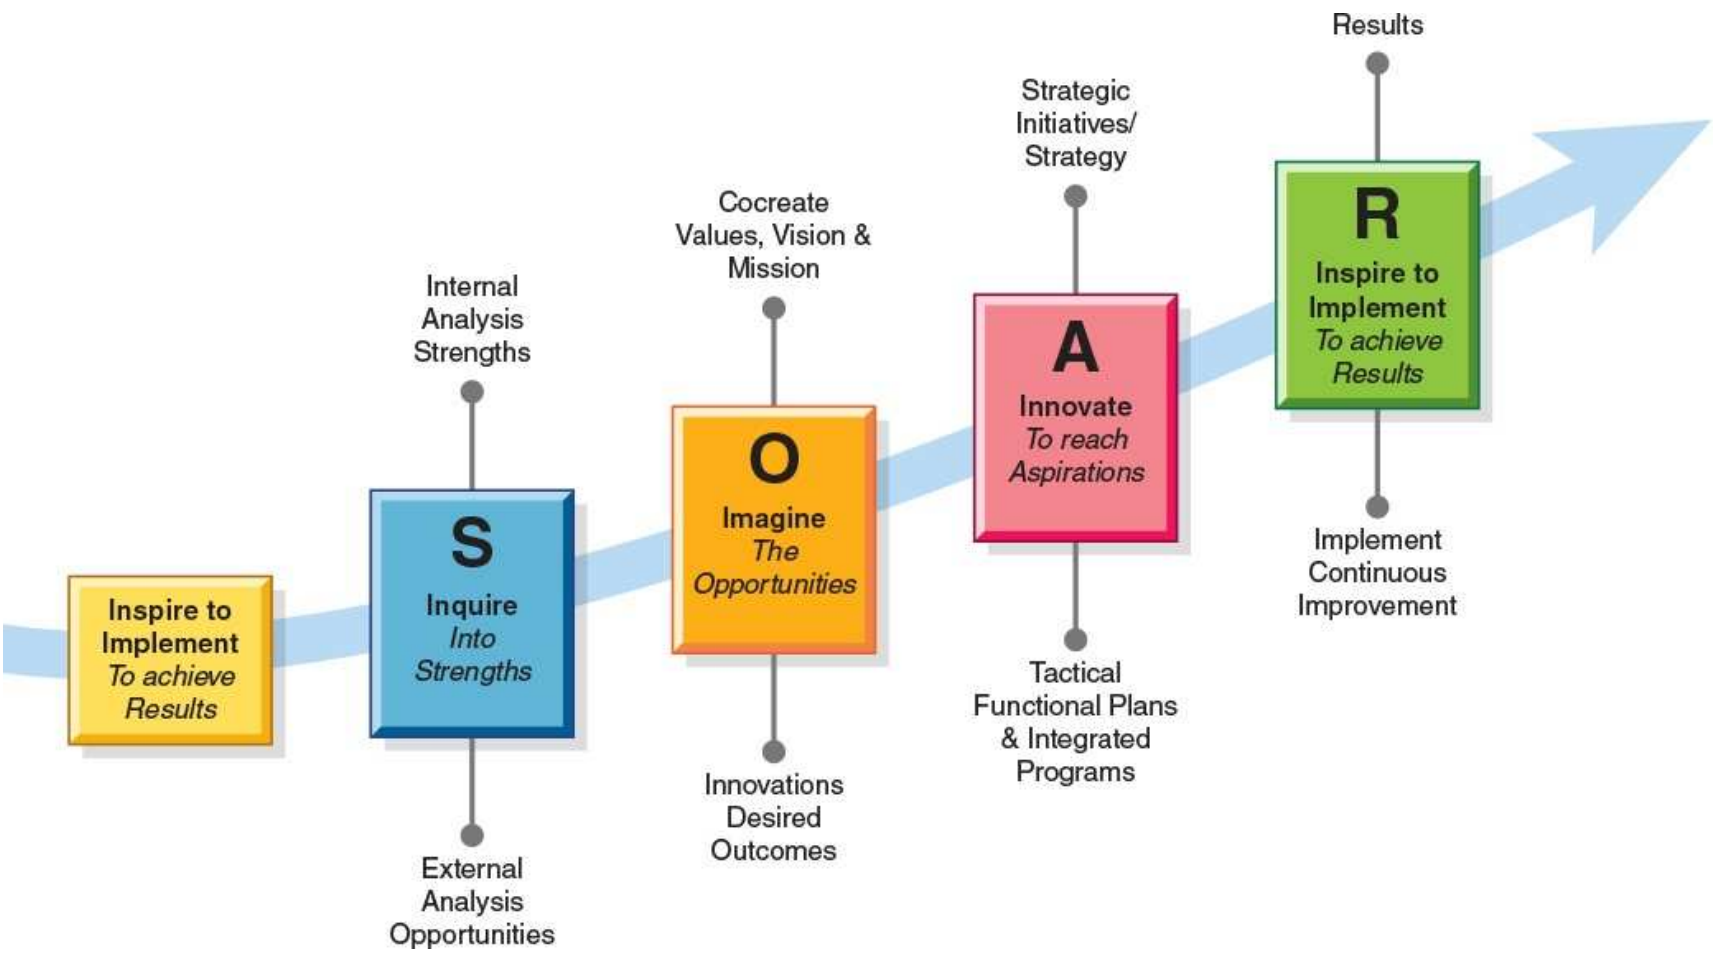

FIGURE 10-2. SOAR framework. (*Source:* Used with permission from www.soar-strategy.com)

Think back to **Jack Camp**, the patient described in the Reflective Practice display. The nurse could apply these guidelines when attempting to change staff behavior and the patient's behavior. Ultimately, a positive

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

outcome for both could be achieved.

Management Strategies

Two management strategies often used in health care and in many businesses are the SWOT analysis and SOAR strategic planning. Imagine for a moment that you are part of a team developed to ensure that as many employees as possible will get the COVID-19 vaccine as soon as it becomes available. You have heard many of the employees voice concerns about the vaccine's safety and want to begin to address these fears early on. If you use a SWOT analysis, you will work with your team to identify Strengths within the organizations to facilitate a good plan, Weaknesses that will make adopting any plan to realize your goals challenging, Opportunities, and Threats (Stavros & Cole, 2013).

SOAR analysis (Strengths, Opportunities, Aspirations, and Results) is a strategic planning technique that helps organizations focus on their current strengths and opportunities and create a vision of future aspirations and the result they can bring (Fig. 10-2). SOAR focuses on what is known to work in order to create a shared vision for the future, rather than on internal weaknesses or perceived threats that may not eventuate (Stavros & Cole, 2013). Can you think of ways you might use elements of these strategies to begin to hone your leadership and management competencies?

Box 10-6 Five Power Sources

Leaders have five major sources of power in their power grid.

1. Coercive power is the "stick" of leadership where staff are sanctioned for failing to comply with the leader's desires. Coercive power relies on fear but rarely inspires nurses to work with a leader for the long term.
2. Legitimate power emanates from a position or title. It can be short-lived if the leader is ineffective because to be influential, leaders must have followers.
3. Reward power is based on a leader's ability to give something of value in return for performance. Nurse leaders have reward and recognition power that needs to be used in a meaningful, sustainable, and practical way.
4. Expert power is built on the individual's specialized knowledge and access to information. Many nurse leaders struggle with giving up their expert power as clinicians when moving into a leadership role.
5. Referent or relationship power is built on a leader's personal brand. Leaders with referent power are respected and have what is sometimes called "social capital" because people chose to follow them.

Source: Used with permission. Sherman, R. O., & Cohn, T. M. (2019). Using leadership power wisely. *American Nurse Today, 14*(9), 18–19.

Power

Nurses in leadership and managerial roles who wish to be effective change agents are sensitive to both the uses and abuses of power. **Power**, the ability to influence others to achieve a desired effect, has many sources (Box 10-6). Nurses in management positions within an institution have ascribed power associated with the role.

When introducing change, it is helpful to recognize and enlist the support of key power players who can then encourage others to become involved. A group may attribute power to certain individuals because of their expertise, leadership, or charisma. You can probably think of people in the groups to which you belong (school, church, civic groups) who are "natural leaders" because of their demonstrated ability to influence others. These are the "key power players" whose support is essential to effecting change.

All nurses should recognize the inherent power they have to ensure safe, quality, thoughtful, person-centered care and to cause change. Various nursing leaders have repeatedly emphasized that nurses need to use this power and be proactive rather than reactive to have a significant impact on a new vision for nursing. The following factors can play a role in increasing the power base of nursing:

- *Right timing:* Consumers and legislators are frustrated with errors reported in the health care system, the number of uninsured people, and overall problems with the health care system in the United States. Nurses, as the most respected health care providers, are poised to help improve health care and implement health care reform.
- *Size of the nursing profession:* This is one of nursing's greatest assets, with at least 3.9 million RNs in the United States. Nurses are an impressive voting bloc.
- *Nursing's referent power:* The public has expressed a high degree of trust and credibility in the nursing profession.
- *Increasing knowledge base and education for nurses:* More nurses are assuming advanced practice roles, and nursing graduates are strongly encouraged to achieve higher levels of education.
- *Nursing's unique perspective:* The caring component of nursing coupled with evidence-based practice and critical thinking has positioned nurses to deliver complex care to a variety of patients and positively affect quality of care.
- *Desire of consumers and providers for change:* Consumers are increasingly aware of the need for accessible, affordable, and safe quality care (Marquis & Huston, 2017).

Transformational leaders empower their staff by communicating and encouraging learning as well as promoting and

verifying a sense of value about the powerful, life-saving work that nurses perform. Nurses who feel they have no control over their environment are more likely to express frustration toward a coworker and to leave their position or even the profession.

Recall **Rehema Kohls**, the college sophomore considering starting a campus discussion group about STIs. The nurse at the health care center sees that Rehema is considered by her peers to have power and to be a leader. The nurse would integrate this information in helping Rehema develop the group.

Although power and biologic sex issues are still present in our society, this situation has been changing over the last few decades. Women are accomplished professionals and occupy powerful leadership positions in corporations, health care organizations, and political arenas. The proverbial "glass ceiling" barrier has been broached—communication skills that promote group and team initiatives, long thought to be skills associated with women, are now valued by all. People are realizing that techniques for achieving and managing power vary, and that biologic sex differences create unique approaches to increase effectiveness and promote positive outcomes (Marquis & Huston, 2017).

IMPLEMENTING LEADERSHIP AND MANAGEMENT SKILLS IN NURSING CARE

No one is born a leader. People develop leadership qualities through observation, knowledge, and experience. Nurses develop their leadership qualities in the same way, although they may enter nursing with some leadership experience. Nursing students and beginning practicing nurses have some leadership responsibilities but are usually still working at developing leadership skills and learning where and how to apply them. Fortunately, they have support systems for guidance.

Approach leadership like any other new role or skill: slowly and carefully. Nursing students and beginning nurses should be prepared with all the necessary tools or skills before attempting a new leadership role. Initially, nurses develop leadership skills in well-defined clinical situations. With each experience, growth occurs and leadership is strengthened. Have you ever volunteered to lead a group project? Remember that all nurse managers, nurse administrators, and nursing leaders began as inexperienced nurses. If you return to Box 10-1, you will find very concrete suggestions for developing your leadership potential. Read also the accompanying Thoughtful Person-Centered Practice: Challenging Topics (on pages 258–259), to learn about an unexpected leadership challenge that confronted a new graduate nurse.

Nurses who become effective leaders can play a major role in influencing future changes in the health care system.

Patient Care Coordination

Even new graduate nurses have leadership and coordination responsibilities when they begin nursing. Nursing leadership begins with nursing care of the individual patient. Although patients are partners in their care planning, most do not have the knowledge base and skills to direct the plan. Through interpersonal skills and effective communication techniques, nurses lead their patients to acquire new knowledge, solve problems, and change behaviors.

Managing care for even one patient can be an overwhelming responsibility for those new to nursing and its challenges. The student guide to organizing clinical responsibilities in Chapter 18 offers practical help.

An ongoing leadership challenge for all nurses is time management (Leis & Andersen, 2020). The following are helpful steps for using your time effectively:

- Establish goals and priorities for each day. Identify what you need to accomplish each day, differentiating "need to do" from "nice to do" tasks. Be sure to include the patient and the patient's family in establishing these priorities. Ask, "What is it important for you to accomplish today?"
- Evaluate your goals in terms of their ability to meet the needs of the patients entrusted to your care as well as your duties to yourself and your colleagues (other students and members of the team). If one student has a patient whose care requires assistance, other students can plan their day to be able to help at a particular time. This sort of teamwork is an important element of care coordination.
- Establish a timeline. Allocate priorities to hours in your workday so that you will recognize when you are falling behind schedule in time to correct it before the day is lost.
- Evaluate your success or failure in managing time. If you fail to accomplish your goals in the time available, determine

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

whether your goals were overambitious, whether things happened beyond your control (e.g., your patient's condition worsened, requiring more care, or another student required your assistance), or whether you wasted time that could have been better spent (Fig. 10-3).

- Use the results of this evaluation to direct your next day's priorities and timeline.

FIGURE 10-3. A student reviews her success in managing time with her clinical instructor. (*Source:* Used with permission from Shutterstock. *Photo by Joe Mitchell.*)

Remember **Stephen Wall**, the 65-year-old patient in the intensive care unit with multiple injuries. Because of his multiple and complex needs, time management for the nurse is crucial. Applying the steps just identified in this situation would be very helpful when planning and providing care.

Clinical Nurse Leader Role

To have a positive effect on fragmented health care and promote improved collaboration within the entire health care team, the American Association of Colleges of Nursing (AACN) created the nursing professional role of clinical nurse leader (CNL). This master's-prepared nurse who has earned the certified CNL credential works collaboratively with the health care team to facilitate, coordinate, and oversee care provided to patients (Sheets et al., 2012; Stachowiak & Bugel, 2013). This role is not considered an administrative or management role, but rather one of leadership in all health care settings. The CNL should be able to clearly communicate with other health care professionals, integrate evidence-based practices into patient care, and evaluate risks and outcomes that may require change in care plans for patients (AACN, 2012). The person-centered focus of the CNL role includes functioning as a patient advocate, educator, and provider of patient care in complex situations.

Questions have arisen about a perceived overlap or duplication between the roles of the CNL and those of the clinical nurse specialist and case manager. Some nursing professionals also question the need for the CNL at this time. Clinical nurse specialists are advanced practice nurses with specialist education in a defined area of practice; case managers are closely involved with discharge plans, length-of-stay issues, and insurance constraints (Stachowiak & Bugel, 2013). Refer to Chapters 11 and 12 for additional discussions regarding case management.

Thoughtful Person-Centered Practice: Challenging Topics

Nurse Suicide

Many controversial issues make it challenging to know how to respond as a professional nurse in select scenarios. When our obligations or duties are conflicting, this creates a particular type of challenge. How can we be sure which duty or obligation trumps? Often, the nurse's personal and/or professional values may conflict with options desired by patients, families, employers/colleagues, and communities. Not infrequently, nurses have to make clinical judgments balancing promoting and safeguarding personal

integrity and respecting the needs of others.
Read the scenario below and see if you can articulate what you believe, why you believe this, and how these beliefs are likely to inform the decisions you make and your behavior, especially when you are confronted with competing obligations. Based on Tanner's Clinical Judgment Model (2006), consider reflection-in-action and reflection-on-action (Nielson, Stragnell, & Jester, 2007).

Reflection-in-Action

As you read, consider what the new nurse is thinking in the moment—what happened? How did the patient, family, and/or health care provider respond? What did the nurse do next?

Scenario

As a brand-new graduate nurse, I was just beginning my orientation to a step-down medical unit. I was excited about being hired to this unit and was eager to prove my worth to my nurse colleagues. On this particular day, the unit was short-staffed, and I had pulled a full patient load. One of my patients was especially complex and needed several procedures that I had never done before. I was understandably nervous but grateful that I had a preceptor to help me. As the morning evolved, I was becoming increasingly distressed because my preceptor was sitting at the nursing station and seemed indifferent to my appeals for help. She referred me to others for help and I couldn't understand her indifference to my growing distress. When I summoned my courage and sat next to her on my lunch break to ask why she wasn't being more helpful, she admitted that she's been suffering from depression and just narrowly avoided overdosing the prior evening. Her husband walked out 2 weeks ago, leaving her with a 2-year-old son. She said she's finding it more and more difficult to find a reason to want to live. She begged me not to share what she confided in me because at least for the present she needs this job.

Effective Noticing (Cues)

1. What did you notice about the situation initially? What information/observations are significant? What information deviates from what is expected/normal/usual?

Effective Interpreting

2. How would you describe and prioritize the obligations you have in this scenario to respect your preceptor's request to not divulge what she told you "confidentially" with your obligation to get her help? Do you have an obligation to inform the charge nurse of the unit? Are your preceptor's depression and thoughts of suicide affecting patient care? Do you have obligations to yourself and your own well-being?
3. If you cannot fulfill each of these obligations, how will you prioritize them? What basis/rationale do you use for prioritization? Remember that the ANA *Code of Ethics for Nurses* reminds us that "the nurse's primary commitment is to the patient," while at the same time states that "the nurse owes the same duties to self as to others, including the responsibility to promote health and safety, preserve wholeness of character and integrity, maintain competence, and continue personal and professional growth."
4. What do you know about the suicide rate among nurses? What are the warning signs, and how can nurse colleagues be most helpful? What are the modifiable workplace issues that can be addressed to reduce suicide risk?

Scenario

Now I am really feeling overwhelmed, and I have patients to take care of. I decided that dealing with her suicidal thoughts was "above my pay grade" and went to the charge nurse. I was not sure if violating her request to keep this private was the right thing to do. I sure didn't want to feel responsible for her suicide should this happen.

Effective Responding

5. My nurse manager told me about a previous workplace where physicians within his organization had partnered with the American Foundation of Suicide Prevention (AFSP.org) to develop the first physician suicide prevention program in 2009 following similar circumstances. The Healer Education Assessment and Referral (HEAR) program educated clinicians about mental health issues and professional risks and assessed colleagues to detect those in need of help (Moutier et al., 2012; Norcross et al., 2018). They partnered to extend the program to nurses. Now, 4 years later, they identify approximately 40 nurses a year who are high risk and actively expressing suicidality and refer them into treatment. This program also has the potential to identify nurses with substance use disorder and refer them anonymously into treatment while maintaining their license, job, and professional identity. What other resources can you access to better inform your decision?
6. Whether or not you decide to inform the charge nurse, how might you use reflective practice to evaluate your decision so you can respond more confidently in the future? What criteria will you use to evaluate a good response?

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

7. What personal attributes and competencies are most likely to lead to a good response?

Effective Reflecting

8. Do you agree with the choice the nurse made? Would you have made the same choice? Why or why not? What would inform your decision?
9. How do you evaluate your professional and moral judgments?

Reflection-on-Action

Then look back at the nurse's decisions and reflect on your learning—how did your knowledge and/or skills expand based on this scenario? What attitude, value, or belief shifts did you experience (if any) after reading this scenario? What would you do differently if you were in this situation? What more do you need to know to be able to manage this or a similar situation in the future?

Delegating Nursing Care

New graduate nurses use leadership techniques when they direct the work of nonprofessional staff and volunteers and when they delegate tasks to nonprofessional staff. These people, who are unlicensed and function in an assistive role to RNs, are referred to as AP by the ANA, replacing the former term, nursing assistive personnel (NAP). AP may include nurses' aides, certified nursing assistants, or other unlicensed caregivers within the health care environment.

In 2019, ANA issued a Joint Statement on Delegation with the National Council of State Boards of Nursing (https://www.ncsbn.org/Delegation_joint_statement_NCSBN-ANA.pdf). **Delegation** involves the transfer of responsibility for the performance of an activity to another person while retaining accountability for the outcome. It is a critical competency and essential skill for an RN in today's health care environment. RNs may never delegate any elements of the nursing process itself.

QSEN SAFETY

Nurses are responsible for minimizing the risk of harm to patients and providers through both system effectiveness and individual performance. You want to be sure when delegating nursing responsibilities to AP that they are prepared to safely assume this function and that your state nursing practice act and facility policies approve this delegation.

The ANA, which is committed to monitoring the regulation, education, and use of AP, recommends adherence to 10 broad principles guiding RNs prior to delegating care. In addition to the RN's responsibility, several principles focus on the accountability of the health care organization. Organizational accountability for delegation relates to providing sufficient resources, including:

- Sufficient staffing with an appropriate staff mix
- Documenting competencies for all staff providing direct patient care and for ensuring that the RN has access to competence information for the staff to whom the RN is delegating care
- Organizational policies on delegation are developed with the active participation of all nurses and acknowledge that delegation is a professional right and responsibility.

Initially, the RN must be fully aware of the parameters for delegation as outlined in their state's Nurse Practice Act as

well as the employing organization's policies and procedures regarding delegation (Daley, 2013). As a general rule, you should not delegate the assessment, planning, and evolution steps of the nursing process. AP can collect patient data but only the nurse can interpret this data. This means that professional nurses are responsible for the initial patient assessment, discharge planning, health education, care planning, triage, interpretation of patient data, care of invasive lines, administering parenteral medications. What you can delegate are assistance with basic care activities (bathing, grooming, ambulation, feeding) and things like taking vital signs, measuring intake and output, weighing, simple dressing changes, transfers, and postmortem care. Facilities are responsible for ensuring that AP are qualified and capable of performing nursing tasks that RNs may delegate to them. RNs should have involvement in the development of facility policies regarding delegation and also have access to any information regarding competency of the AP on their team.

Before the RN delegates any nursing intervention, a number of additional factors, including the qualifications and capabilities of the AP, should be considered: (1) the stability of the patient's condition, (2) the complexity of the activity to be delegated, (3) the potential for harm, (4) the predictability of the outcome, and (5) the overall context of other patient needs. The RN remains accountable for any delegated nursing care or outcomes and is responsible for the supervision of the AP to whom tasks are delegated. AP need an awareness of any patient precautions, when to seek assistance, and what should immediately be reported to the RN. Inappropriate delegation decisions can jeopardize the safety of patients and endanger a nurse's professional practice.

Concept Mastery Alert

Even if a task is delegatable, AP are not permitted to perform it independently. Your hospital may allow AP to ambulate patients, but only you can decide if your AP should ambulate a particular patient at a particular time.

Delegation skills must be developed, practiced, and strengthened. Nurse educators are encouraged by the ANA to integrate principles for delegation into the curriculum and ensure that nursing students have opportunities to practice delegation skills. Chapter 18 has additional information on delegation and the student nurse. Professional development offerings assist RNs to develop critical thinking skills that promote good judgment and provide strategies to delegate effectively. Experienced and reliable AP who perform delegated skills competently allow RNs to focus more on assessment and development or revision of the nursing care plan and learn skills that improve their nursing practice. The Decision Tree for Delegation by Registered Nurses distributed by the ANA and NCSBN is a helpful guide for nurses who are learning to delegate (Fig. 10-4). Refer to Chapter 18 for additional information on nursing delegation, including the five rights of delegation. Gradually, new nurses assume increased leadership responsibilities as they become primary nurses, case managers, or unit coordinators. An understanding of the function and organization of both the nursing department and health care organization is required to be an effective leader.

Knowledge of the Administrative Structure

Nursing Department

The nursing team can also be viewed in the broader context of the entire nursing department of a health care institution or facility. Nurses should have an interest in the functioning of the department. Using this knowledge, nurses can seek information or change through appropriate channels. The more nurses understand how the nursing department runs, the better able they are to work constructively to meet the department's objectives.

Employing Institution or Facility

Nurses at all levels need to be knowledgeable about the administrative structure and functions of their employing institution or facility. When problems arise concerning professional, unit, departmental, or institutional or facility objectives, nurses must be able to use the proper channels of communication and refer problems up the chain of command. For example, if a nurse believes that work assignments are routinely incompatible with basic patient safety and quality but gets no response after discussing this with an immediate nursing supervisor, the nurse should take those complaints to the director of nursing. If the director of nursing fails to respond adequately, the nurse should determine to whom the director of nursing reports and should approach that person. Similarly, a nurse concerned about medical care should first approach the attending physician. If the attending physician fails to respond, the nurse must then contact the nursing coordinator and, in consultation with the nursing coordinator, approach the medical director. The structure of these channels is shown in the facility's organization chart, which details the relationships among the various administrative positions, departments, and job titles. Sometimes, the nurse is referred to committees that deal with specific issues.

Support for Leadership Training

Nurses intent on developing their leadership ability have multiple resources available to them—mentorship, preceptorship, participation in professional organizations, and continuing education.

Mentorship

Mentorship is a relationship in which an experienced person (the mentor) advises and assists a less experienced person

(protégé). This is an effective way of easing a new nurse into leadership responsibilities. Mentors link with protégés by common interest and provide support, information, and network links. The relationship does not include financial reward.

Mentors should be excellent role models. If you find a nurse with expertise in practice or topics that interest you, you can ask if they would be interested in becoming your mentor. The advantages of having an effective mentor are many. Ideally, good mentors can suggest options for your growth and development and identify helpful resources. Good mentors will welcome your questions and provide honest feedback on your progress. Many nurses who are passionate about nursing and the profession's future are happy to share what brings meaning and purpose to their lives.

Mentorship is valuable in all types of nursing positions. As a nurse climbs the ladder of leadership responsibility, a mentor who is experienced in management and administrative functions may be of great assistance. A mentor can be key in helping a less experienced nurse assume added responsibilities and position changes. Many mentorship relationships also become lasting friendships.

Preceptorship

An alternative model for leadership training is preceptorship. The preceptor (experienced nurse) is selected (and generally paid) to introduce an employee to new responsibilities through teaching and guidance. This orientation ensures that the new RN gains the appropriate knowledge, skills, and support to care for patients safely and efficiently. Preceptors also assist new RNs to learn the policies and procedures of a new facility and can serve as a mentor by modeling excellent nursing practice. The relationship is limited by the new employee's needs. When you are ready to select your first professional nursing position you will want to carefully evaluate how different institutions orient new nurses. You may also find it helpful to explore student internships in a setting or specialty of interest (Fig. 10-5).

Participation in Nursing and Other Professional Organizations

The many nursing organizations at the international, national, state, district, and local levels are discussed in Chapter 1. They are major forces for nursing leadership and have active groups throughout the United States and abroad. The more than 100 professional organizations address specialty interests, goals, and purposes, as well as advocate for nurses and nursing. Representatives of these nursing organizations also work with ANA lobbyists in Congress and state legislatures regarding nursing concerns, health care issues, and quality care.

FIGURE 10-6. Nurse manager learning domain framework. (© 2006 Nurse Manager Leadership Partnership. By the American Organization for Nursing Leadership [AONL]. [2015]. Executives [AONE]. All rights reserved.)

The AONE, now the American Organization for Nursing Leadership (AONL), recognizing the need for leadership development for nurse managers, united with the American Association of Critical-Care Nurses (AACN) and the Association of periOperative Registered Nurses (AORN) to develop a model that includes content on the science and art of management for nurses, and creation of the leader within yourself (Fig. 10-6) (AONE, 2012). This model is intended to engage nurses in exploring potential solutions to achieve their management goals.

Nursing leadership can define what the future should look like and help make it happen. Participation in nursing and other professional organizations provides important opportunities for nurses to develop and exhibit leadership.

Continuing Education

Many programs for developing leadership, managerial, and administrative skills are available to nurses. Courses can be taken by correspondence or over the Internet. Periodicals and books also provide continuing education for emerging leaders. Many continuing education programs are available to prepare nurses before they assume higher levels of leadership; some are geared to nurses already in such positions. Nurses should choose a program that matches their learning needs. Many State Boards of Nursing require evidence of continuing education credits prior to renewal of RN licenses.

Developing Resilience

Every nurse needs to be a leader to make health care work for those who need it. Nursing is often hard work, and at times the challenges can be daunting. Never has it been more important for nurses who are passionate about patients, families, and communities, as well as their own health, to be intentional about developing resilience—the capacity to thrive not only in spite of, but because of, challenges. Here are a few hints for developing resilience:

- Begin and end the day with gratitude.
- Practice mindfulness: What is the most important thing right now? See Chapter 1.
- Appreciate that all humans are limited; some things can't be "fixed."
- Appreciate the power of connectedness and presence.
- Stop frequently to stretch and take deep diaphragmatic breaths.
- Reflect frequently on what brings you joy, makes you smile.
- Keep a positive, hopeful outlook. Hope allows us to envision a positive future and work to bring this into being.

A piece in *The New York Times* during the pandemic (Zimmerman, 2020) lists optimism (that is also realistic), a moral compass, religious or spiritual beliefs, cognitive and emotional flexibility, and social connectedness as the tools common to resilient people. Most important among these are the quality of our close personal relationships, especially with parents and primary caregivers.

Nurse Self-Care Alert

During the pandemic, we learned anew how important resilience is for all health care professionals. How

many of the practices that promote resilience have you incorporated into your life? Do you have a positive vision for the future that you are working to achieve, and are you making time to nourish supportive close personal relationships?

Leadership and Advancing Clinician Well-Being

As the National Academy of Sciences, Engineering, and Medicine make clear, patient-centered, high-quality care relies on the well-being, health, and safety of health care clinicians. Its 2019 report, *Taking action against clinical burnout*, makes clinicians' well-being a priority for every health care professional leader, citing how the alarmingly high rates of **clinician burnout** in the United States, including that of nurses, are detrimental to the quality of care being provided, harmful to individuals in the workforce, and costly. Key messages from the report include:

- Clinician burnout—a workplace syndrome resulting from chronic job stress—is a major problem across the nation. Substantial symptoms are present in 35% to 54% of nurses and physicians, and 45% to 60% of medical students and residents. Current understanding suggests that burnout is a growing public health concern among all types of clinicians and learners.
- Burnout has high personal costs for individual clinicians and learners as well as high social and economic costs for their organizations and society as a whole. Burnout threatens the successful achievement of important health care quality goals: better care, improved population health, and lower health care costs. Mitigating clinician burnout and supporting professional well-being is essential to providing high-quality patient care.
- Emotional exhaustion, depersonalization, and loss of sense of professional efficacy—the three dimensions of burnout—are a barrier to professional well-being. Although the absence of burnout does not equate to a state of professional well-being, addressing the factors contributing to burnout and the barriers to well-being is critical to reaching the goal of professional well-being among clinicians. This will ultimately help health systems improve patients', families', and clinicians' experiences and outcomes.

Nurse leaders are fortunate to have excellent resources to address how we can create supportive work environments to prevent clinician burnout and distress. Read more about the American Association of Critical Care Nurses *Standards for Establishing and Sustaining Healthy Work Environments* in Chapter 19 and check the AONL's Elements of a Healthy Practice Environment at: https://www.aonl.org/elements-healthy-practice-environment. You will also want to be familiar with the ANCC's Pathways to Excellence. This program acknowledges that nurses operate on the frontlines of health care, dedicating their working lives to protecting promoting, and improving health care for all. To do this to the best of their ability, they need to operate in an environment that supports their own needs and promotes high standards (https://www.nursingworld.org/organizational-programs/pathway/overview/). Read Pabico (2020) for a discussion titled "Dispelling common myths about ANCC's Pathway to Excellence."

The authors of this text celebrate the leadership potential in every nurse and our profession's ability to be the critical difference for those in need.

DEVELOPING CLINICAL REASONING AND CLINICAL JUDGMENT

. Interview several experienced nurses and ask them what qualities make for the best nursing leaders. Reflect on your personal experience in groups (e.g., within your family, church, school, community). Identify the roles you characteristically assume and what qualities you bring to the group (e.g., enthusiasm, positive thinking, vision, self-direction). Consider whether those qualities will serve you well in professional nursing groups and situations. Are there new qualities you need to develop if you want to become an effective nurse leader? Why?
. Identify a situation in your class or school that "cried out for change." Discuss with your classmates which students emerged as leaders to address the need for change. Review and critique the steps they engaged in to bring about change. See if your group can reach consensus about the adequacy of their leadership behaviors.
. Identify a health challenge where you live. Examples include things like increases in the suicide rate and opioid addiction, inadequate mental health services, and disparities in access to needed health services. Brainstorm with your classmates how nurse leaders might effectively address these challenges and become a catalyst for needed change.

PRACTICING FOR NCLEX

. A charge nurse on the step-down unit will likely use which leadership style during resuscitation efforts for a cardiac arrest?

a. Democratic
b. Laissez-faire
c. Servant
d. Autocratic

. A chief nursing officer with a transformational leadership style is developing a plan for success to obtain Magnet status. What are the most appropriate strategies for the leader to use? Select all that apply.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

a. Sharing their vision of excellence in patient care and high-level education
b. Encouraging nurses to incorporate evidence-based practice through hospital committees and to join nursing organizations
c. Promoting compliance by reminding subordinates that they have a good salary and working conditions
d. Ensuring employees are kept abreast of new developments in their department and the larger organization
e. Writing the Magnet application and supporting documentation with limited input from the nursing staff
f. Encouraging nurse managers and nurses to self-schedule as long as proper coverage is maintained

. After observing conflicts between nurses about scheduling, a nurse manager compliments the nurses for achieving the monthly goal of no patient falls. What strategy for conflict resolution did the manager display?

a. Collaborating
b. Competing
c. Compromising
d. Smoothing

. A nurse who is considered a servant leader is working in an economically depressed community setting up a free mobile health clinic. Which actions best exemplify a servant leader? Select all that apply.

a. Motivating coworkers to solicit funding to set up the clinic
b. Setting only realistic goals that are present oriented and easily achieved
c. Forming an autocratic governing body to keep the project on track
d. Spending time with supporters to help them grow in their roles
e. Ensuring that other's lowest priority needs are served
f. Prizing leadership because of the need to serve others

. A nurse manager is planning to update a health care provider's office from paper to electronic health records (EHR) by using the eight-step process for planned change. Place the following actions in the order in which they should be initiated:

a. The nurse devises a plan to switch to EHR.
b. The nurse records the time spent on written records versus EHR.
c. The nurse attains approval from management for new computers.
d. The nurse analyzes all options for converting to EHR.
e. The nurse installs new computers and provides an in-service for the staff.
f. The nurse explores possible barriers to changing to EHR.
g. The nurse follows up with the staff to check compliance with the new system.
h. The nurse evaluates the effects of changing to EHR.

. A nurse manager who is working to institute the SBAR communication process for all health care providers is meeting resistance to the change. How does the manager best approach the resistance?

a. Containing the anxiety in a small group and moving forward with the initiative
b. Explaining the change and listing the advantages to the person and the organization
c. Reprimanding those who oppose the new initiative and praising those who willingly accept the change
d. Quickly introducing the change and involving staff in implementation of the change

. A nurse is asked to act as a mentor to a new nurse. What action will the mentor expect to perform?

a. Accepting payment to introduce the new nurse to their responsibilities
b. Hiring the new nurse and assigning duties related to the position
c. Enabling the new nurse to participate in professional organizations
d. Advising and assisting the new nurse to adjust to the work environment of a busy emergency department

. An RN on a telemetry unit is falling behind while performing assessments and administering medications. Which task can the nurse safely delegate to the AP?

a. Assessing a patient who has just arrived on the unit
b. Teaching a patient with newly diagnosed diabetes about foot care
c. Documenting a patient's I & O in the electronic health record
d. Helping a postoperative patient out of bed for the first time

. Nursing students enrolled in a leadership and management course attend clinical on a surgical unit. As they are planning their day, they note one student has a complex patient with multiple medications and the need for frequent turning, pressure injury wound care, and tube feedings. Which action by the group best reflects effective teamwork and coordination?

a. Asking patients to prioritize what they want to accomplish each day
b. Including a "nice to do" for every "need to do" task on the list
c. "Front loading" their schedules with "must do" priorities
d. Scheduling times to assist the student with the complex patient

. The nurses at an acute care hospital participate in a committee focused on achieving Magnet status. Which action do the nurses suggest to help achieve this goal?

a. Centralizing the decision-making and scheduling process
b. Promoting self-governance at the unit level
c. Deterring professional autonomy to promote teamwork
d. Promoting evidence-based practice over innovative nursing practice

. A nursing student is actively working toward strengthening their leadership skills. What action will best assist the student to meet this goal?

a. Being self-reliant in solving problems
b. Being self-directed and asking for assistance when needed
c. Using written communication instead of face-to-face communication
d. Reporting nurses who do not follow policies to the nurse manager

. A nurse erroneously administered two tablets of acetaminophen totaling 650 mg to their patient. When reporting this to the nurse manager, the nurse states, "there are two tablets in a package labeled '325 mg. acetaminophen.' The prescription reads 'administer 325 mg of acetaminophen;' therefore, I administered what was in the package." Based on a philosophy of just culture, what should happen next?

a. The nurse should be found at fault for not clarifying the order.
b. The package labeling should be reviewed with the pharmacy.
c. The nurse should be disciplined.
d. No follow-up is needed as the medication is over the counter.

. Nursing students enrolled in a leadership and management course discuss the roles of the nurse manager during post conference. What roles should the students include in the discussion? Select all that apply.

a. Developing and overseeing a unit budget for staff and patient care
b. Hiring, evaluating, and promoting staff growth
c. Performing patient care
d. Developing treatment plans to improve care and patient outcomes
e. Handling escalating situations between caregivers and patients

ANSWERS WITH RATIONALES

. **d.** Autocratic leadership assumes control over the decisions and activities of the group, such as taking charge of emergencies, dictating schedules and work responsibilities, and scheduling mandatory in-service training. Polling other nurses is an example of democratic leadership, which is characterized by a sense of equality among the leader and other participants, with decisions and activities being shared. In laissez-faire leadership, the leader relinquishes power to the group and encourages independent activity by group members. Examples of laissez-faire leadership style are allowing the nurses to divide up the tasks and encouraging them to work independently.

. **a, b.** Transformational leaders inspire, motivate, create intellectually stimulating practice environments, and challenge themselves and others to grow personally and professionally. They demonstrate caring and vulnerability, communicating honestly and openly. They are risk takers and pay attention to process as well as outcomes. Instituting a reward program and reminding workers that they have a good salary and working conditions are examples of transactional leadership, which is based on a task-and-reward orientation. Ensuring that employees keep abreast of new developments in nursing care is a characteristic of quantum leadership. The group and leader work together to accomplish mutually set goals and outcomes with the democratic leadership style, and the laissez-faire style encourages independent activity by group members, such as setting their own schedules and work activities.

. **d.** The manager who avoids conflict by complimenting the parties and avoids disagreements is using smoothing to reduce the emotion of the conflict. The original conflict is rarely resolved with this technique. Collaborating is a joint effort to resolve the conflict with a win–win solution. All parties set aside previously determined goals, determine a priority common goal, and accept mutual responsibility for achieving this goal. Competing results is a win for one party at the expense of the other group. Compromising occurs when both parties relinquish something of equal value.

. **a, d, f.** To serve as servant leaders, nurses need to invest in those who support the organization's values, show passion, can play to their strengths, and demonstrate a positive attitude. They should develop their vision to see the future related to a current anticipated need and motivate others to follow and engage. They also need to provide ongoing opportunities for collaborations, sharing, reflection, encouragement, and celebration as well as hard work. The servant

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

leader allows others to have a voice, to exercise control, and to practice leading themselves. The servant first makes sure that other people's highest priority needs are being served. The best test, and most difficult to administer, is: Do those served grow as people? Do they, while being served, become healthier, wiser, freer, more autonomous, more likely themselves to become servants?

. **b, f, d, c, a, e, h, g.** Planned change involves the following steps: (1) recognize symptoms that indicate a change is needed and collect data, (2) identify a problem to be solved through change, (3) determine and analyze alternative solutions, (4) select a course of action from possible solutions, (5) plan for making the change, (6) implement the change, (7) evaluate the change, and (8) stabilize the change.

. **b.** Change is ubiquitous, as is resistance to change. The manager should explain the proposed change to all affected, list the advantages of the proposed change for all parties, introduce the change gradually, and involve everyone affected by the change in the design and implementation of the process. The manager should not use the reward/punishment style to overcome resistance to change.

. **d.** Mentorship is a relationship in which an experienced person (the mentor) advises and assists a less experienced person (protégé). This is an effective way of easing a new nurse into leadership responsibilities. An experienced nurse who is paid to introduce an employee to new responsibilities through teaching and guidance describes a preceptor, not a mentor. The nurse mentor does not hire or schedule new nurses. Nurses do not need mentors to join professional organizations.

. **c.** Documenting a patient's I & O on a flow chart does not require professional judgment and can be delegated to AP. Professional nurses are responsible for the initial patient assessment, discharge planning, health education, care planning, triage, interpretation of patient data, care of invasive lines, administering parenteral medications. What they can delegate are assistance with basic care activities (bathing, grooming, ambulation, feeding) and things like taking vital signs, measuring intake and output, weighing, simple dressing changes, transfers, and postmortem care.

. **d.** The students use teamwork and collaboration to appropriately coordinate patient care; this is the best response. By asking the patient to prioritize what they want to accomplish each day, the nurse is demonstrating an effective time management technique. To manage time, the nurse should establish goals and priorities for each day, differentiating "need to do" from "nice to do" tasks; the nurse should include the patient in this process. The nurse should also establish a time line, allocating priorities to hours in the workday in to keep track of falling behind and correct the problem before the day is lost.

. **b.** Magnet hospitals use a decentralized decision-making process, self-governance at the unit level, and respect for and acknowledgment of professional autonomy. In Magnet hospitals, 14 characteristics, the Forces of Magnetism, have been recognized that identify quality patient care, excellent nursing care, and innovations in professional nursing practice.

. **b.** Leader behavior includes being self-directed and knowing your limitations; demonstrating a commitment to excellence; having a clear vision and strategic focus that allow movement forward toward a creative solution; showing commitment to and passion for your work; and displaying problem-solving skills, trustworthiness and integrity, respectfulness, accessibility, empathy and caring, desire to be of service, and responsibility to enhance the personal growth of all staff.

. **b.** A just culture is committed to accountability and safety. Nurses are encouraged to disclose clinical errors and potential error situations without the fear of punitive actions, allowing others to learn from this experience. Health care workers within the organization discuss concerns and challenges related to patient care, turning them into opportunities for improvement.

. **a, b, e.** Responsibilities of the nurse manager include overseeing day-to-day operations, designing and managing a budget, supervising and providing training to team members, hiring and evaluating nursing staff, handling escalating situations between patients and health care providers, and collaborating to attain optimal patient outcomes. Nurse managers' roles do not typically include performing patient care or developing treatment plans.

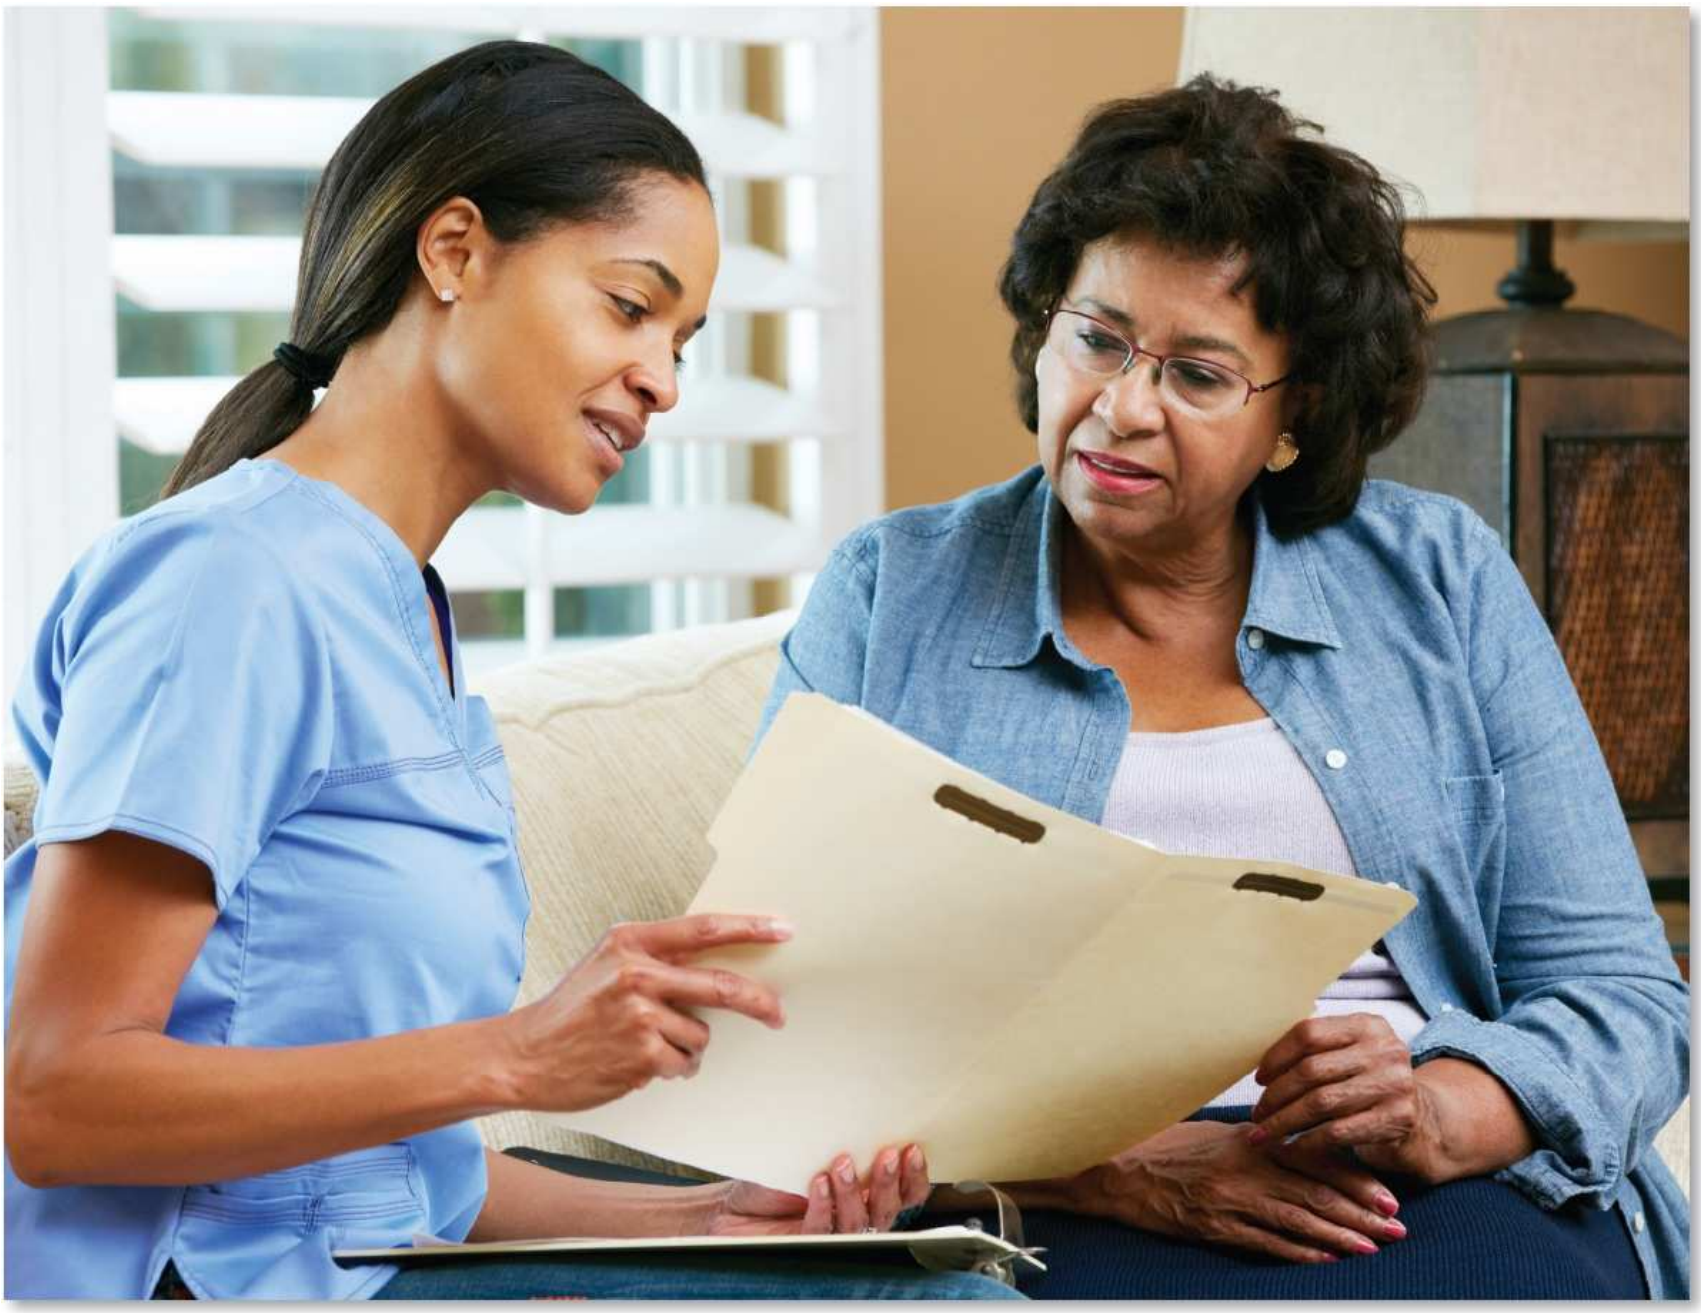
UNIT II Health Care Delivery



Nurses care for patients in a wide variety of settings. Knowledge of the varied methods of care delivery is necessary in today's complex health care system. As the health care environments change, nurses are increasingly providing care to promote wellness and restore health outside traditional hospital settings. Patients may receive health care services as inpatients or ambulatory outpatients in a hospital, through voluntary or public health facilities, in daycare centers and schools, in offices and clinics, in their home, or through crisis intervention centers. A health care team often provides care to meet a full range of physical, psychological, sociocultural, economic, and spiritual needs. Health care services may be financed through federal funding, health maintenance organizations, or private insurance. All these factors, combined with increasing concern about health care provision and costs, have raised questions about cost containment, consumer rights, fragmentation of care, vulnerable populations, and changing patient populations and needs.

As patients move among health care settings, the nurse is most often the member of the health care team responsible for coordinating care and teaching so that continuity of care is maintained. Unit II provides information about the various settings in which nursing care is provided and the resources for that care. Chapter 11 discusses the health care system as a whole, highlighting access, quality and safety, and affordability concerns. Newer models of organizing health care, such as patient-centered medical homes and accountable care organizations, are presented. Chapter 12 focuses on how nurses work with the interprofessional health care team and considers nursing care provided in the home and other community-based settings. Care coordination and continuity during handoffs are important as patients are admitted, transferred, and discharged from health care settings. Because health care is increasingly provided to patients in their own homes, Chapter 12 describes the characteristics and roles of the home health care nurse as well as the components of a home visit. The information in this unit enables the nurse to work within the health care system to meet individualized patient needs and provide holistic, thoughtful, person-centered care.

"… a realization that the call to the nurse is not only for the bedside care of the sick, but to help in seeking out the deep-lying basic causes of illness and misery, that in the future there may be less sickness to nurse and to cure."

Lillian Wald (1867–1940), *a visionary humanitarian who initiated child-labor law revision, improved housing conditions in tenements, supported education for people with mental disabilities, originated public health nursing, and founded the Visiting Nurse Service at the Henry Street Settlement House, in New York City.*

Health Care Delivery System

Paul Cochran

Paul is a 55-year-old man with a history of mental illness and numerous visits to mental health inpatient and outpatient facilities; he comes to the mental health clinic for follow-up. He says, “I ran out of my medications last week, but I feel fine. Do I still need to take them?”

Margaret Ritchie

Margaret, a 63-year-old woman, is caring at home for her 67-year-old husband who has been diagnosed with amyotrophic lateral sclerosis (ALS, or Lou Gehrig disease). She states, “All of the help from the home care facility has been a blessing. But I need more help and some equipment now that our insurance won’t cover. Plus, now the doctor says that his condition has really worsened, and he probably has 6 months or less to live.”

Maritza Cortes

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Maritza, a 37-year-old Hispanic woman, brings her daughter to the emergency department. The child is diagnosed with a strep throat and is given a starting dose of penicillin. After receiving discharge instructions, including information about possible complications, and a prescription for additional doses of penicillin, she says, “I can’t afford to get the prescription filled. Exactly what are these problems, and what are my son’s chances for having them, too?”

Learning Outcomes

After completing the chapter, you will be able to accomplish the following:

. Identify elements of a well-functioning health care delivery system.
. Describe strategies to increase access to affordable, high-quality care.
. Compare and contrast these health care delivery systems: health care providers and hospitals, multispecialty practice groups, community health centers, prepaid group practices, accountable care organizations, medical homes, and medical neighborhoods.
. Evaluate four basic ways to pay for health care.
. Compare and contrast settings and facilities that provide health care.
. Describe the members of the interprofessional health care team.
. Discuss selected trends and issues affecting health care delivery.
. Describe the role of nursing in meeting the challenges of health care reform.

single-payer system
value-based purchasing

Designing a system for and delivering health care that adequately meets the needs of a diverse public is a complex challenge. Health care planners have always worried about access, quality, and cost. Who should have access to what quality of care at what cost? What you think about health care in the United States largely depends on your past experiences. If you are well insured or independently wealthy, you can access the best health care in the world. If you lack insurance and have limited financial resources, you may die of a disease that might have been prevented or treated in an early stage if you had access to quality care. The COVID-19 pandemic in 2020 quickly alerted the public to the disproportionate incidence of COVID-19 among communities of color. As treatments and vaccines became available, just and equitable distribution plans were the topic of much study.

The U.S. system has been criticized for providing too little care to some and too much of the wrong type of care to others. Many now believe that a moral society owes health care to its citizens—that health care is like clean water, sanitation, and basic education. Others, however, believe that health care is a commodity, like automobiles, to be sold and purchased in the marketplace. If you lack the funds to buy a car, that may be sad, but society has no obligation to purchase a car for you.

As you read this chapter, ask yourself what you believe about health care. Is it simply unfortunate if people cannot afford the health care that they and their families need? Learning about how health care works may not seem as exciting as learning how to administer medications safely, but your nursing practice every day will be affected by decisions made by governments, insurers, and health care institutions. Nursing's challenge as profits and politics increasingly dictate health priorities is to keep health care strongly focused on the needs of patients and the public. Health care in the United States is a business; revenues need to be generated to make care possible. But health care can never be *only* a business. First and primarily, it is a service a moral society provides for its vulnerable members. Nurses play a critical role in keeping health care centered on the patient and family. See the accompanying Reflective Practice display on pages 272–273.

HEALTH CARE: THE BIG PICTURE

In 2001, describing a "new health system for the 21st century," the Institute of Medicine (IOM) called for six outcomes, envisioning a system that is safe, effective, efficient, patient-centered, timely, and equitable. (Note: The IOM titling has changed in recent years and is now referred to more broadly as The National Academies of Sciences, Engineering, and Medicine.) In 2007, the Institute for Healthcare Improvement (IHI) in Cambridge, Massachusetts, developed the IHI Triple Aim framework (Fig. 11-1) to improve the patient care experience, improve the health of a population, and reduce per capita health care costs *at the same time* (www.ihi.org; Berwick et al., 2008). Considered radical in 2007, the Triple Aim is now used throughout health care and was more recently revised to the Quadruple Aim to include workers and job satisfaction. This fourth aim recognizes the difficulties frontline caregivers experience while trying to simultaneously improve the patient experience and the health of a population while reducing costs, and directs attention to providing the knowledge, resources, and partnerships frontline caregivers need. Never was this truer than during the pandemic when caregiver burnout rates increased to alarming levels.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

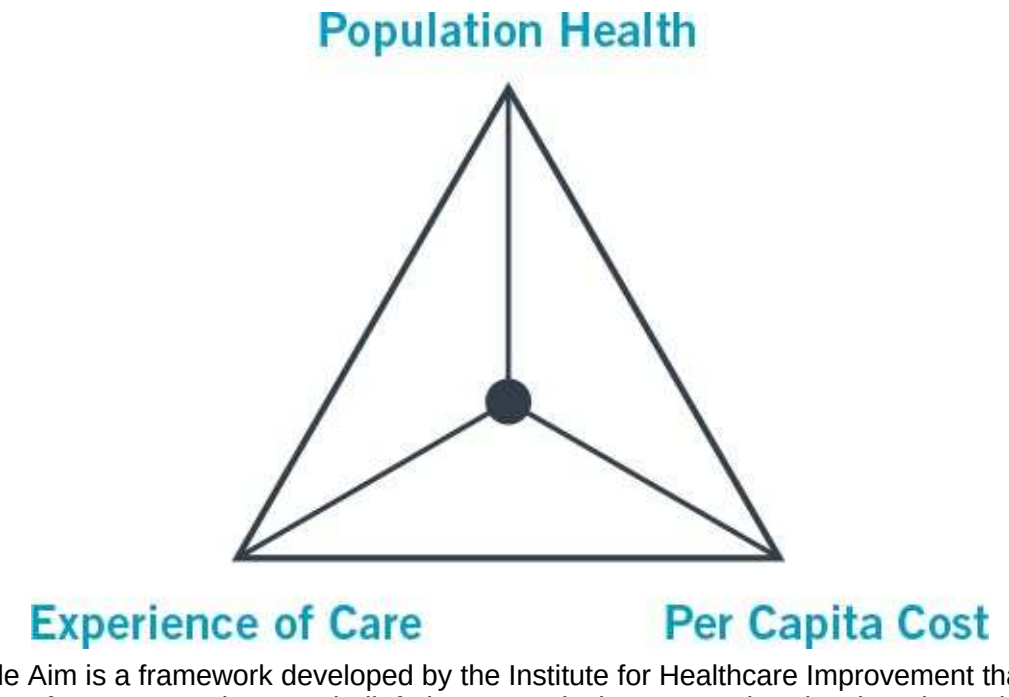

FIGURE 11-1. The IHI Triple Aim is a framework developed by the Institute for Healthcare Improvement that describes an approach to optimizing health system performance. It is IHI's belief that new designs must be developed to simultaneously pursue three dimensions, which we call the "Triple Aim": (1) Improving the patient experience of care (including quality and satisfaction); (2) improving the health of populations; and (3) reducing the per capita cost of health care. (*Source:* From Berwick, D. M., Nolan, T. W., & Whittington, J. [2008]. The Triple Aim: care, health, and cost. *Health Affairs [Millwood]*, *27*[3], 759–769. The IHI Triple Aim framework was developed by the Institute for Healthcare Improvement in Boston, Massachusetts [www.ihi.org].)

QSEN Reflective Practice: Cultivating QSEN Competencies

CHALLENGE TO COGNITIVE SKILLS

Maritza Cortes, a 37-year-old Hispanic woman, came into the emergency department (ED) this summer with her daughter who was diagnosed with strep throat using a rapid strep test. The child was given an initial dose of penicillin and was getting ready for discharge. When I entered the patient's room to give her mother the discharge instructions and the prescription for 10 more doses of penicillin, Ms. Cortes said that she could not afford the medication and probably would not be able to have the prescription filled. I told her that it is essential to fill the medication because strep throat can lead to rheumatic fever and glomerulonephritis. She then asked me to elaborate, requesting exact information about the chances of her son also developing these complications. She wanted exact numbers and did not settle for my answer of "No matter what the percentage is, the medication is still necessary." She also wanted me to elaborate on the disease processes of rheumatic fever and glomerulonephritis. Although I do know basic information about these conditions, I did not feel comfortable being the primary and sole informer.

Thinking Outside the Box: Possible Courses of Action

- Make up a percentage to tell the mother and give a partial explanation of the diseases so that she would sign the discharge papers.
- Look up the answer in books available in the ED or search the internet.
- Try to persuade her that numbers don't matter and that the possible diseases are very severe.
- Ask the nurse to inform me or explain the information to me while we are with the patient.
- Ask the health care provider to inform me or provide the information to me while we are with the patient.

Evaluating a Good Outcome: How Do I Define Success?

- Ms. Cortes receives adequate information regarding the medication and the conditions that may follow strep throat.
- Ms. Cortes obtains medication and gives it to her daughter, as prescribed.
- The standards of nursing care and protocols of the hospital are maintained.
- I am able to acknowledge that I need the help of others, seeking out their help; in return, those people help me.

Personal Learning: Here's to the Future!

Because I was working under my preceptor's license and he had to cosign my signature, I decided that he would be the best person to go to first. My preceptor said that this situation is a common occurrence in this ED because many people come in to get checked, even though they know that they cannot afford the medication, if necessary. As a justification to themselves, patients often want to know what are the exact chances for developing complications, which will likely influence whether or not they go ahead and fill the prescription.

My preceptor and I returned to the room, where he was able to explain rheumatic fever and glomerulonephritis in detail in Spanish. Because he was able to do this at the education level of the patient's mother and be very direct and persuasive, she was no longer concerned about exact numbers. She stated that she would try to get the medication filled, and then she signed the discharge document. Unfortunately, there is no way to follow-up in these situations. I still wonder if the patient was able to get her medications.

Medical information is always changing, and what people held as standards of practice years ago differ from what we practice today. Similarly, what we hold today may be obsolete and even wrong in the years ahead. As a student, I find overwhelming the vast information that is necessary to be a competent nurse, especially in pharmacology. In this example, I probably should have been able to give the patient a comprehensive explanation of rheumatic fever and glomerulonephritis. However, I didn't feel comfortable. I do feel that I have learned a lot in the past years as a student, but I know that the knowledge I need to act as a professional nurse is much greater! While it is overwhelming and very challenging at times, I think continued learning is one reason why nursing is such a wonderful profession. I think it will never get boring.

Julia Strobel, Georgetown University

QSEN SELF-REFLECTION ON QUALITY AND SAFETY COMPETENCIES DEVELOPING KNOWLEDGE, SKILLS, AND ATTITUDES FOR CONTINUOUS IMPROVEMENT

How do you think you would respond in a similar situation? Why? What does this tell you about yourself and about the adequacy of your skills for professional practice? Can you think of other ways to respond? What other knowledge, attitudes, and skills do you need to develop to continuously improve the quality and safety of care for patients like Ms. Cortes's daughter?

Patient-Centered Care: What made creating a partnership with Ms. Cortes and her daughter so challenging? What abilities did the student's preceptor possess and use to achieve a good outcome? What special talents do you bring to creating successful partnerships? Reread the preceptor's statement about this type of situation being common in the ED. Do such statements reflect culturally competent nursing? Or are such statements judgmental? Support your response.

Teamwork and Collaboration/Quality Improvement: What communication skills do you need to improve to ensure that you function as a competent, caring, and responsible member of the patient care team and that you obtain appropriate assistance when needed? What special talents do you bring to promoting a well-functioning team?

Safety/Evidence-Based Practice: What priority did all involved with Ms. Cortes accord to her daughter's health, well-being, and safety? What resources should be available to those who lack the financial resources to purchase prescribed medications or treatment? Were the team members successful advocates for this family? Did the nursing student seek out the most appropriate resources for information? Why or why not? What other resources could have been helpful? Do you agree with the criteria to evaluate a successful outcome? Did the nursing student meet the criteria? Explain your answers.

The IOM report, *Best Care at Lower Cost*, concluded that Americans would be better served by a nimbler health care system that is consistently reliable and that constantly, systematically, and seamlessly improves (Smith et al., 2012). It states its vision as follows: "… achieving a learning healthcare system—one in which science and informatics, patient–clinician partnerships, incentives, and culture are aligned to promote and enable continuous and real-time improvement, in both the effectiveness and efficiency of care—is both necessary and possible for the nation." The IOM (2015) report, *Transforming Health Care Scheduling and Access: Getting to Now*, reviews what is currently known and experienced with respect to health care access, scheduling, and wait times nationally, and offers preliminary observations about emerging best practices and promising strategies. In 2017 the National Academy of Medicine released its report, *Vital Directions for Health and Health Care*, which identifies fundamental challenges (persistent inequities in health, rapidly aging population, new and emerging health threats, persisting care fragmentation and discontinuity, health expenditure costs and waste, and constrained innovation due to outmoded approaches). The report's good news is that "the nation is equipped to tackle these formidable challenges from a position of unprecedented knowledge and substantial capacity." Described as realistic tools are:

- A new paradigm of health care delivery and financing
- Fully embracing the centrality of population and community health
- Increased focus on individual and family engagement
- Biomedical innovation, precision medicine, and new diagnostic capabilities
- Advances in digital technology and telemedicine

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

- Promise of "big data" to drive scientific progress.

See Figure 11-2. Sadly, the pandemic of 2020 revealed widespread weaknesses in the ability of the U.S. health care delivery system to respond to unprecedented challenges.

Access to Health Care

People have access to health care if they are able to obtain health care when they need it. Access depends on the ability to pay and the availability of services. Nearly 48 million nonelderly Americans were uninsured in 2011. Decreasing the number of uninsured is a key goal of the 2010 **Patient Protection and Affordable Care Act (PPACA)**, which provides Medicaid or subsidized coverage to qualifying people with incomes up to 400% of poverty, beginning in 2014. A key element of the health care law that took effect in 2014 provided a new way to get health insurance: The **Health Insurance Marketplace**. The Marketplace was designed to help people more easily find health insurance that fits their budget. Every health insurance plan in the new Marketplace must offer comprehensive coverage, from doctors to medications to hospital visits. People can compare all their insurance options in terms of price, benefits, quality, and other features that may be important to them, in plain language that makes sense. As of the end of 2015, the number of uninsured nonelderly Americans stood at 28.5 million, a significant reduction. Even under the PPACA (commonly referred to as just the ACA), many uninsured people site the high cost of insurance as the main reason they lack coverage (Henry J. Kaiser Family Foundation, 2020). Before the pandemic, the uninsured rate had been increasing for several years—despite an improving economy. The latest uninsured data from the Census Bureau shows the number of uninsured people grew to 29.2 million (or 10.8%) in 2019. It has likely gone up since then. FamiliesUSA (2020) reported that because of job losses between February and May of 2020, 5.4 million laid-off workers became uninsured. These recent increases in the number of uninsured adults are 39% higher than any annual increase ever recorded. The highest previous increase took place over the 1-year period from 2008 to 2009, when 3.9 million nonelderly adults became uninsured.

FIGURE 11-2. Vital directions for health and health care framework. (*Source:* Dzau, V. J., McClellan, M. B., McGinnis, J. M., & Finkelman, E. M. (Eds.). [2017]. Box 11-1 **Summary: Key Facts about the Uninsured Population**

How many people are uninsured?

For the third year in a row, the number of uninsured increased in 2019. In 2019, 28.9 million nonelderly individuals were uninsured, an increase of more than one million from 2018. Coverage losses were driven by declines in Medicaid and non-group coverage and were particularly large among Hispanic people and for children. Despite these recent increases, the uninsured rate in 2019 was substantially lower than it was in 2010, when the first ACA provisions went into effect and prior to the full implementation of Medicaid expansion and the establishment of Health Insurance Marketplaces.

Who are the uninsured?
Most uninsured people have at least one worker in the family. Families with low incomes are more likely to be uninsured. Reflecting the more limited availability of public coverage in some states, adults are more likely to be uninsured than children. People of color are at higher risk of being uninsured than non-Hispanic White people.

Why are people uninsured?
Even under the ACA, many uninsured people cite the high cost of insurance as the main reason they lack coverage. In 2019, 73.7% of uninsured adults said that they were uninsured because the cost of coverage was too high. Many people do not have access to coverage through a job, and some people, particularly poor adults in states that did not expand Medicaid, remain ineligible for financial assistance for coverage. In addition, undocumented immigrants are ineligible for Medicaid or Marketplace coverage.

How does not having coverage affect health care access?
People without insurance coverage have worse access to care than people who are insured. Three in ten uninsured adults in 2019 went without needed medical care due to cost. Studies repeatedly demonstrate that uninsured people are less likely than those with insurance to receive preventive care and services for major health conditions and chronic diseases.

What are the financial implications of being uninsured?
The uninsured often face unaffordable medical bills when they do seek care. In 2019, uninsured nonelderly adults were over twice as likely as those with private coverage to have had problems paying medical bills in the past 12 months. These bills can quickly translate into medical debt since most of the uninsured have low or moderate incomes and have little, if any, savings.

Source: Tolbert, J., Orgera, K., & Damico, A. (2020, November 6). *Key facts about uninsured population*. Kaiser Family Foundation. https://www.kff.org/uninsured/issue-brief/key-facts-about-the-uninsured-population/

These record-breaking increases in the number of uninsured have taken place during the country's worst public health crisis in more than a century and the sharpest and deepest economic downturn since World War II. Nevertheless, no federal COVID-19 legislation signed into law has attempted to restore or preserve comprehensive health insurance. Continual efforts to eliminate the ACA threaten the well-being of the 23 million who get health insurance through the ACA.

See Box 11-1, Figure 11-3, and HealthCare.gov for more up-to-date information as you are reading this chapter. Also see the Vulnerable Population Alert.

Shortage of Providers

A 2013 U.S. Subcommittee on Primary Health and Aging reported that nearly 57 million people in the United States—one in five Americans—live in areas without adequate access to primary health care due to a shortage of providers in their communities. The facts in this report are sobering:

- Fifty years ago, half of the doctors in the United States practiced primary care, but today fewer than one in three do.
- As many as 45,000 people die each year because they do not have health insurance and do not get to a doctor on time.
- The average primary care physician in the United States is 47 years old, and one quarter are nearing retirement.
- In 2011, about 17,000 doctors graduated from U.S. medical schools. Despite the fact that over half of patient visits are for primary care, only 7% of the nation's medical school graduates now choose a primary care career (Sanders, 2013).

The report cites nurse Linda Aiken noting that nurse practitioners are a good solution for the shortage of primary care predicted to worsen as millions of currently uninsured Americans get health insurance as a result of the ACA. "Research shows that care by nurse practitioners is excellent, highly satisfactory to patients, accessible, and affordable."

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

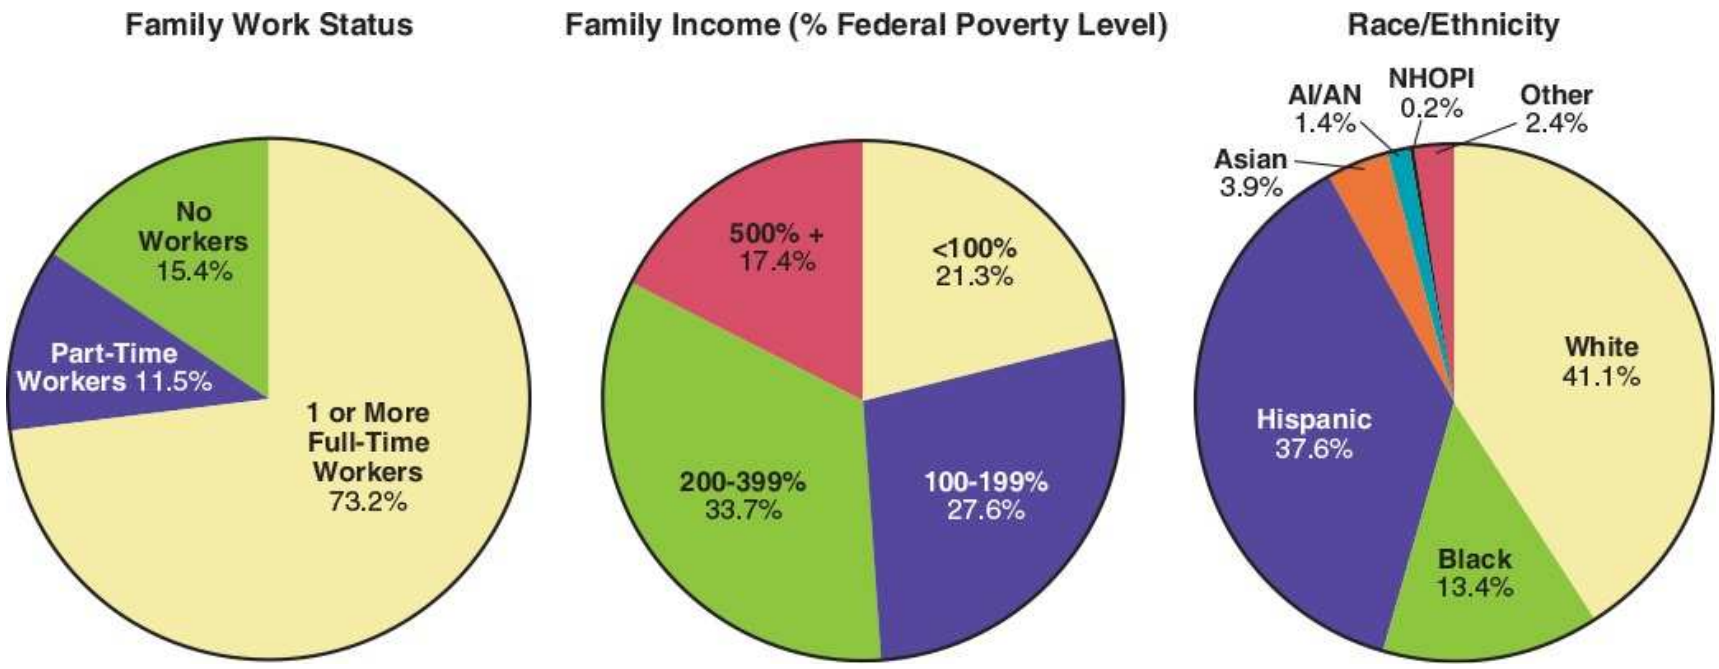

FIGURE 11-3. Characteristics of the nonelderly uninsured, 2019. Includes nonelderly individuals ages 0 to 64 years. AIAN, American Indian/Alaska Native; NHOPI, Native Hawaiians and Other Pacific Islanders. Hispanic people may be of any race but are categorized as Hispanic; other groups are all non-Hispanic. The 2019 Census Bureau poverty threshold for a family of three was $20,578. (*Source:* KFF analysis of 2019 American Community Survey, 1-Year Estimates.)

Although nursing is currently one of the fastest growing occupations in the country, demand is rapidly outpacing supply. An expected 1.2 million vacancies will emerge for registered nurses between 2014 and 2022. By 2025, the shortfall is expected to be more than twice as large as any nurse shortage since the mid-1960s. A major reason for the projected shortages is the aging of the baby boomer generation and their demand for health care services (Grant, 2016).

Vulnerable Population Alert: Caring for Persons Who Are Undocumented

Shifting immigration policies under the Trump administration are leading to substantially increased fears among the immigrant community. Many public health nurses report that families are no longer keeping clinic appointments, vaccinating children, or showing up at food banks or even church. What do you need to know to best care for undocumented immigrants in your clinical sites and communities?

Gostin, L. O. (2019, September 5). Is affording undocumented immigrants health coverage a radical proposal? *Journal of the American Medical Association*, *322*(15), 1438–1439. https://doi.org/10.1001/jama.2019.15806. https://newsatjama.jama.com/2019/09/05/jama-forum-is-affording-undocumented-immigrants-health-coverage-a-radical-proposal/

More than 10 million undocumented immigrants in the United States are systematically excluded from federal health insurance programs: Medicaid, Medicare, the Affordable Care Act (ACA) marketplaces, and the Children's Health Insurance Program (CHIP). Lawful immigrants can participate in these programs, with limitations, which vary by program.

Refugees are generally eligible for Medicaid but only for the first 7 years of residence. Asylum seekers qualify for ACA exchanges starting 180 days after applying for asylum. Several states extend Medicaid and CHIP to lawfully present children and pregnant women without the 5-year wait. Currently, Medicaid payments for emergency services are the only federal funds allowed for undocumented immigrants; federal law requires hospitals to stabilize patients with life-threatening conditions, irrespective of immigration status.

Consequently, almost half of undocumented nonelderly adults and one third of undocumented children are uninsured. For basic medical care, immigrants often turn to 1,400 federally funded health care centers providing services on a sliding-scale based on ability to pay, irrespective of residency status.

There are, however, strong reasons to afford health coverage for this population: modest economic costs, safeguarding the public's health by curbing the spread of infectious diseases, and complying with international law that requires health coverage for migrants. Many countries fail to afford migrants equitable access to health coverage, so adopting a policy of providing undocumented immigrants on par with other residents—integrated into existing federal health insurance programs—would help the United States regain moral leadership, in line with World Health Organization (WHO) and United Nations (UN) guidelines, and potentially save money (discussed below).

Treating Fear: Sanctuary Doctoring

This web page contains presentation materials, video, patient flyers, and lapel pins designed to be simple and useful in helping physicians and health-care professionals meet the needs of their patients who may be undocumented or suffering stresses related to close family or community members being undocumented. https://hsd.luc.edu/bioethics/content/sanctuary-doctor/

Health coverage for immigrants. HealthCare.gov. https://www.healthcare.gov/immigrants/coverage/

Legislation Addressing Health Care Access

Although the ACA greatly reduced the number of uninsured in the United States, it was bitterly opposed by many who sought its repeal. The American Nurses Association is joining with many groups to reject any legislation that would increase the number of uninsured or impose harmful cuts and changes to the Medicaid program.

Quality and Safety

The 1999 IOM report, *To Err Is Human,* shocked the world when it claimed that at least 44,000 and perhaps as many as 98,000 people die in U.S. hospitals each year as a result of medical errors that could have been prevented. Even the lower number exceeds the combined annual deaths caused by automobile accidents, breast cancer, and AIDS. A common source of medical errors is the decentralized and fragmented nature of the health care delivery system—or "nonsystem." The report recommended a four-tiered strategy, which is now well underway:

- Establishing a national focus to create leadership, research, tools, and protocols to enhance our knowledge about safety
- Identifying and learning from errors by developing a nationwide public mandatory reporting system and by encouraging health care organizations and practitioners to develop and participate in voluntary reporting systems
- Raising performance standards and expectations for improvements in safety through the actions of oversight organizations, professional groups, and group purchasers of health care
- Implementing safety systems in health care organizations to ensure safe practices

In 2001, the IOM defined **quality** as the degree to which health services for people and populations increase the likelihood of desired health outcomes and are consistent with professional knowledge. More simply, quality is the right care for the right person at the right time. Every year, the Agency for Health Care Research and Quality (AHRQ) issues national reports on quality and disparities. To learn more about health care quality, visit the websites listed in the Internet Resources for this chapter, which can be found on.

Increasingly, quality of care is being measured and used to evaluate hospitals and other providers and to award reimbursement.

Reliable Care Accountability Matrix

High reliability organizations are organizations that operate in complex, high-hazard domains for extended periods without serious accidents or catastrophic failures. Characteristics of high reliability organizations include preoccupation with failure, reluctance to simplify, sensitivity to operations, deference to expertise, and commitment to resilience (AHRQ, 2016). To deliver care in a highly reliable way and achieve quality—the right care for the right person at the right time—consistent and evidence-based practices must be translated and communicated to the front-line staff. Nurses represent the majority of health care workers and are on the front line to assure the provision of safe and reliable care. An example of nurse leadership making a critical difference follows.

In February 2015, as an effort to disseminate and enculture a standard set of practices for a focused number of quality goals across the system, Bon Secours Health System Incorporated Chief Nursing and Quality Officer Andrea Mazzoccoli working with Chief Medical Officer Marlon Priest, introduced a Reliable Care Accountability Matrix (RCAM) as part of the system's Clinical Transformation efforts (Fig. 11-4). The RCAM was created to (1) define the critical core clinical processes for eight specific domains of quality outcomes and (2) define expectations for standard practices.

Standardization is a cornerstone of high reliability, and the RCAM was designed to standardize the evidence-based interventions critical to quality tactics used across the system to meet quality goals. The eight domain areas that were aligned with the key quality priorities for the system are: mortality; readmissions; length of stay (LOS); the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS); hand hygiene; and the prevention of *Clostridioides difficile*, surgical site infections, and catheter-associated urinary tract infections. Each domain contained no more than five standards of practice derived from the system Learning Communities and national standards believed to be critical in achieving goals.

The RCAM define expectations of performance of the tactics, for example:

- Validating that a Foley catheter is removed via the nurse-driven Foley catheter removal protocol at the time the catheter is no longer necessary via a chart audit
- Validating that sepsis order sets are used through an audit of usage

RCAM validators use face-to-face validation techniques that combine outcome data, observations, chart reviews, and interviews to assess compliance with the RCAM components and provide feedback to Bon Secours hospitals on any identified gaps in process. Alongside the work to create a reliable culture, this standard became a focal point of conversations to hold one another accountable. The RCAM is leading to significant improvement in desired outcomes on key measures.

Pay for Performance/Value-Based Purchasing

Pay for performance is a strategy using financial incentives to reward providers for the achievement of a range of payer objectives, including delivery efficiencies, submission of data and measures to the payer, and improved quality and

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

patient safety. Using the concept of **value-based purchasing**, the Hospital Value-based Purchasing (VBP) Program requires the Centers for Medicare and Medicaid Services (CMS) to redistribute a portion of the Medicare payments to hospitals for inpatient services based on performance on quality measures. The National Committee for Quality Assurance (NCQA) developed the Healthcare Effectiveness Data and Information Set (HEDIS), a tool used by more than 90% of U.S. health plans to measure performance in important dimensions of care and service. Altogether, HEDIS consists of 80 measures across five domains of care. Because so many plans collect HEDIS data, and because the measures are so specifically defined, HEDIS makes it possible to compare the performance of health plans on an "apples-to-apples" basis. Health plans also use HEDIS results themselves to see where they need to focus their improvement efforts.

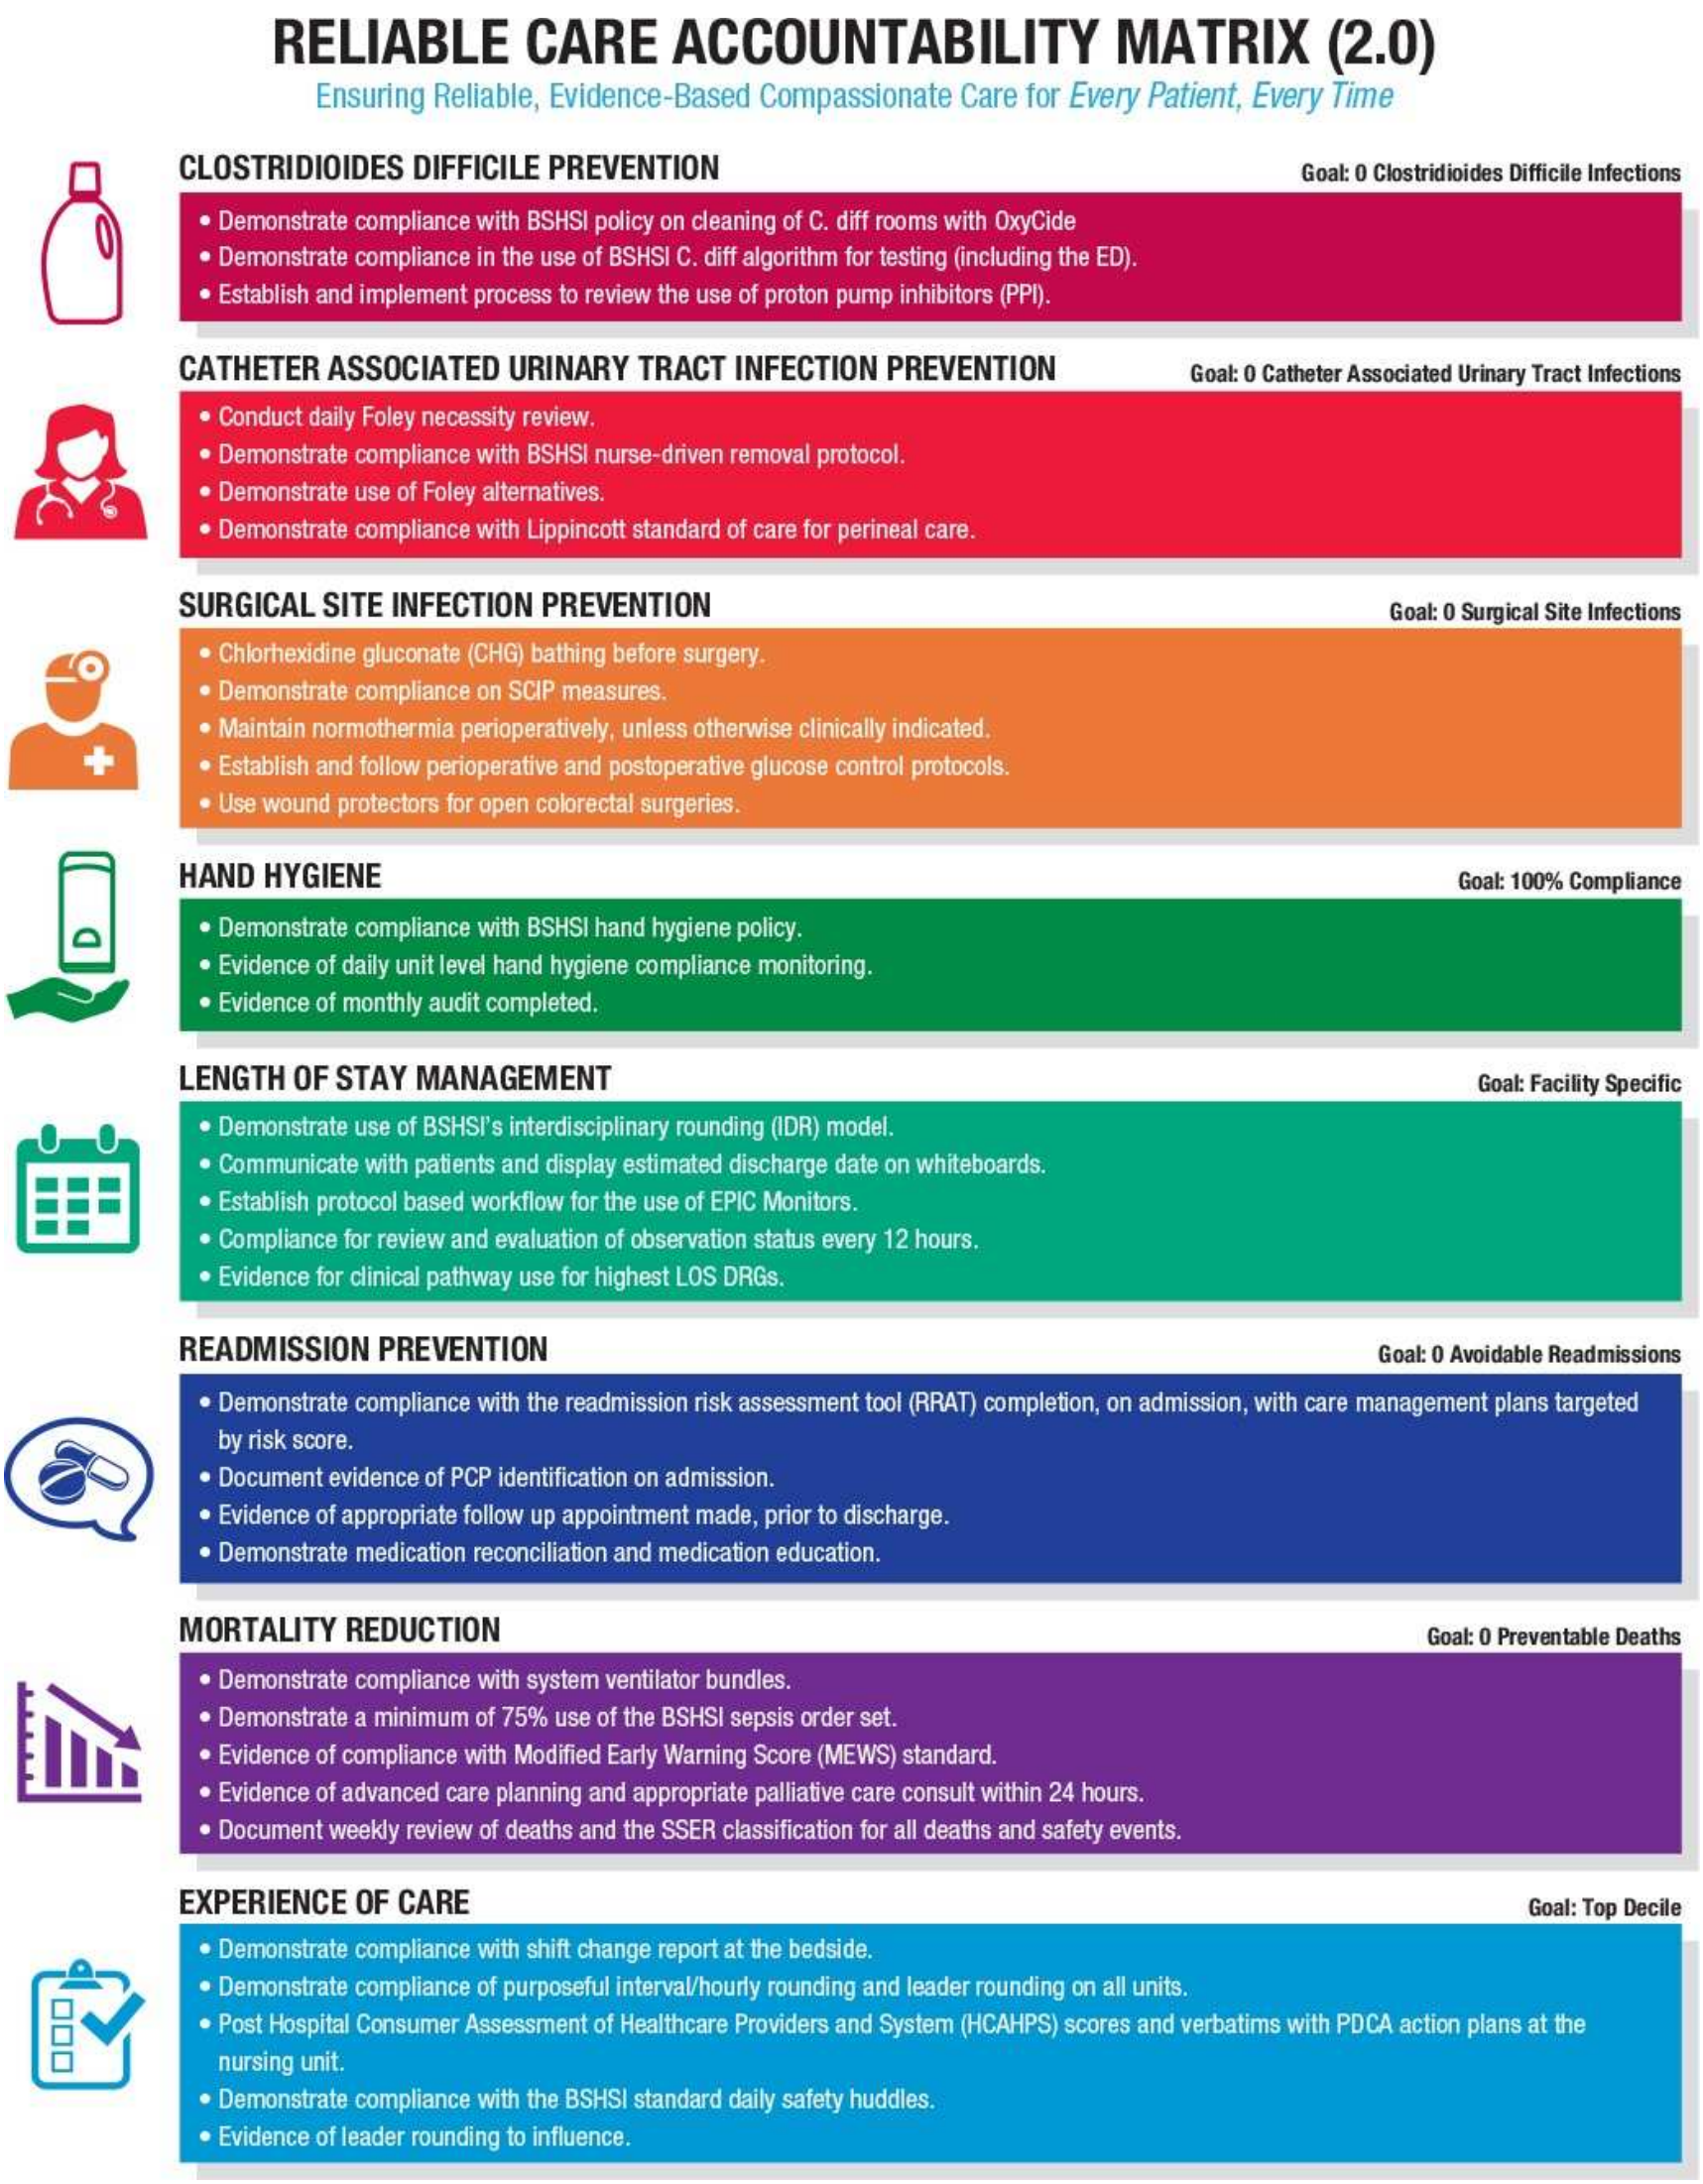

FIGURE 11-4. Reliable Care Accountability Matrix (RCAM). The Reliable Care Accountability Matrix identifies the critical core clinical processes for eight specific domains of quality outcomes. (*Source:*https://www.chausa.org/publications/catholic-health-world/archives/issues/july-1-2016/set-clear-goals-measures-to-achieve-results-from-c-suite-to-bedside Updated from Bon Secours Health System, 2016.)

HEDIS measures address a broad range of important health issues. Among them are asthma medication use, persistence of beta-blocker treatment after a heart attack, controlling high blood pressure, comprehensive diabetes care, breast cancer screening, antidepressant medication management, childhood and adolescent immunization status, and childhood and adult weight/body mass index (BMI) assessment.

In 2011, Medicare finalized a plan to alter reimbursements based on the quality-of-care hospitals provide and patients' satisfaction during their stays. This was a dramatic step toward paying for better care, not just more care. Seventy percent of the bonuses initially were based on how often hospitals followed guidelines on 12 clinical care measures. The other 30% were determined by how patients rated hospitals on their experiences (Rau, 2011).

The HCAHPS Survey is the first national, standardized, publicly reported survey of patients' perspectives of hospital care. HCAHPS (pronounced "H-caps"), also known as the CAHPS Hospital Survey, is a 21-item survey instrument and data collection methodology for measuring patients' perceptions of their hospital experience. While many hospitals have collected information on patient satisfaction for their own internal use, until HCAHPS there were no common metrics and no national standards for collecting and publicly reporting information about patients' experience of care. Since 2008, HCAHPS has allowed valid comparisons to be made across hospitals locally, regionally, and nationally. The HCAHPS Survey asks recently discharged patients about aspects of their hospital experience that they are uniquely suited to address. The core survey items ask "how often" or whether patients experienced a critical aspect of hospital care, rather than whether they were "satisfied" with the care.

Eleven HCAHPS measures (seven summary measures, two individual items, and two global items) are publicly reported on the Medicare.gov Hospital Compare website (http://www.medicare.gov/hospitalcompare) for each participating hospital. The six composites summarize how well nurses and doctors communicate with patients, how responsive hospital staff are to patients' needs, how well hospital staff help patients manage pain, how well staff communicate with patients about medicines, and whether key information is provided at discharge. The two individual items address the cleanliness and quietness of patients' rooms, while the two global items report patients' overall rating of the hospital and whether they would recommend the hospital to family and friends (HCAHPS Fact Sheet, 2021).

In April 2015, CMS added HCAHPS Star Ratings to the Hospital Compare website. HCAHPS Star Ratings summarize the results for each HCAHPS measure and present it in a format that is increasingly familiar to consumers, making it easier to use the information and spotlight excellence in health care quality. Scores are calculated using seven groups of measures: mortality, safety of care, readmission, patient experience, effectiveness of care, timeliness of care, and efficient use of medical imaging (Medicare.gov, 2017). As of December 2016, only 83, or 1.8%, of participating hospitals had earned the highest five-star rating.

Penalties for Excess Readmissions

In October 2012, more than 2,000 hospitals were penalized by the government because many of their patients were readmitted soon after discharge. These hospitals forfeited more than $280 million in Medicare funds because the government considers readmissions a prime symptom of an overly expensive and uncoordinated health system. Until now, hospitals had little financial incentive to ensure that patients get the care they need once they leave the hospital (Rau, 2012).

Affordability

How Health Care Is Financed

Health care financing involves two streams of money: the collection of money for health care (money going in) and reimbursement of health care providers for health care (money going out). The United States is a **multipayer system**: its "payers" include both private insurance companies and the government. Distinctive to the United States is the dominance of the private element over the public. The United States spends 17% to 18% of its gross domestic product (GDP) on health care—more than any other country in the world. The government estimates that an aging population, improving economy, and the health care overhaul will push spending on medical services to almost 20% of the U.S. gross domestic product by 2021 (CMS.gov, 2021). While some argue that nothing is more important than health and no price is too high to pay, the increasing percentage of the GDP being allocated to health care means less money for education, defense, homeland security, public parks, the arts, and other priorities. See Table 11-1 for a description of strategies to reduce health care costs.

Many believe that the solution to rising U.S. health care costs is a **single-payer system**—that is, have one entity such as a government run the organization, collect all health care fees, and pay out all health care costs. In the current U.S. free market system, there are tens of thousands of different health care organizations and huge administrative waste. The Physicians for a National Health Program (PNHP) promote a single-payer system in which all hospitals, doctors, and other health care providers would bill one entity for their services. "This alone would reduce administrative waste greatly and save money, which could be used to provide care and insurance to those who currently don't have it" (PNHP, 2016). During President Obama's efforts to reform health care, the Senate did not allow discussion of a single-payer system.

Table 11-1 Strategies to Reduce Health Care Costs

CHANGES IN REIMBURSEMENT AND REGULATORY ENVIRONMENT		
Strategy	***Description***	***Comments***
Prospective payment system: Diagnosis-Related Groups (DRGs) and Resource Utilization Groups (RUGs)	Inpatient hospital services for Medicare patients are grouped into DRGs with a fixed reimbursement amount with adjustments based on case severity, rural/urban/regional costs, and teaching costs; RUGs in long-term care.	This changes the financial incentives linked to doing more in order to gain more reimbursement.
Capitation and managed care	**Capitation** gives providers a fixed amount per enrollee of health plan. In managed care, the provider or system receives a capitated payment for each patient enrolled in the program and assumes financial risk.	This aims to build a payment plan for select diagnoses or procedures that consist of best standards of care at the lowest cost. Quality of care may suffer if there is too much emphasis on cost.
Bundled payments	Provider receives a fixed sum of money to provide a range of services.	Again, the fixed sum aims to decrease costs of health care by changing the financial incentives.
Rate setting	Government could set targets or caps for spending on health care services. Government could establish prices for services or even payment approaches that public and private payers would use.	Could equalize prices across payers and focus competition on health management and customer service. Diagnoses can be modified to game the system. Some see this as heavy-handed.
Comparative effectiveness analysis	Explicitly assess and weigh the benefits and costs of new technologies, and make decisions about whether a medical benefit is worth the cost and whether it should be covered by a public or private insurance program.	This forces providers to factor in costs when making decisions about new technologies and challenges the “more is always better” thinking.
Increasing patient cost sharing	This leads to higher deductibles.	Higher cost sharing reduces demand (and some people with few resources may not seek indicated services), which over the longer run will dampen incentives for research and investment. Can raise barriers to even necessary and appropriate care.
CHANGES IN CARE DELIVERY		
Strategy	***Description***	***Comments***
Utilizing quality improvement tools (such as Lean Six Sigma, PDSA) to reduce waste and improve safety	These efforts link interventions to valued outcomes.	Today’s greater focus on quality makes it less likely that patients will suffer unnecessary or harmful treatment.
Improving transitions across settings (to decrease 30-day readmissions)	Make sure that all vital information essential to care coordination gets transferred with the patient.	Better patient handoffs will improve outcomes and the patient and family experience.

Making the delivery of medical services more efficient and less costly	October 1, 2014 is the compliance date for use of new codes that classify diseases and health problems; estimated to save $6 billion over 10 years. These code sets, known as the *International Classification of Diseases, 10th Edition* diagnosis and procedure codes, or ICD-10, will include codes for new procedures and diagnoses that improve the quality of information available for quality improvement and payment purposes.	Efforts to increase efficiency and cost without sacrificing quality are welcome.
Eliminating unnecessary costs such as those resulting from fraud and abuse	For too long, measures to identify and address fraud and abuse have been inadequate, which have greatly contributed to rising health care costs.	Nurses can play an important role in reporting suspected fraud and abuse.
Improving population health	These efforts change the focus from individual patients to targeted populations.	Efforts to improve population health could have a long-term effect on disease prevalence and help reduce health care spending.

PDSA, plan, do, study, act.

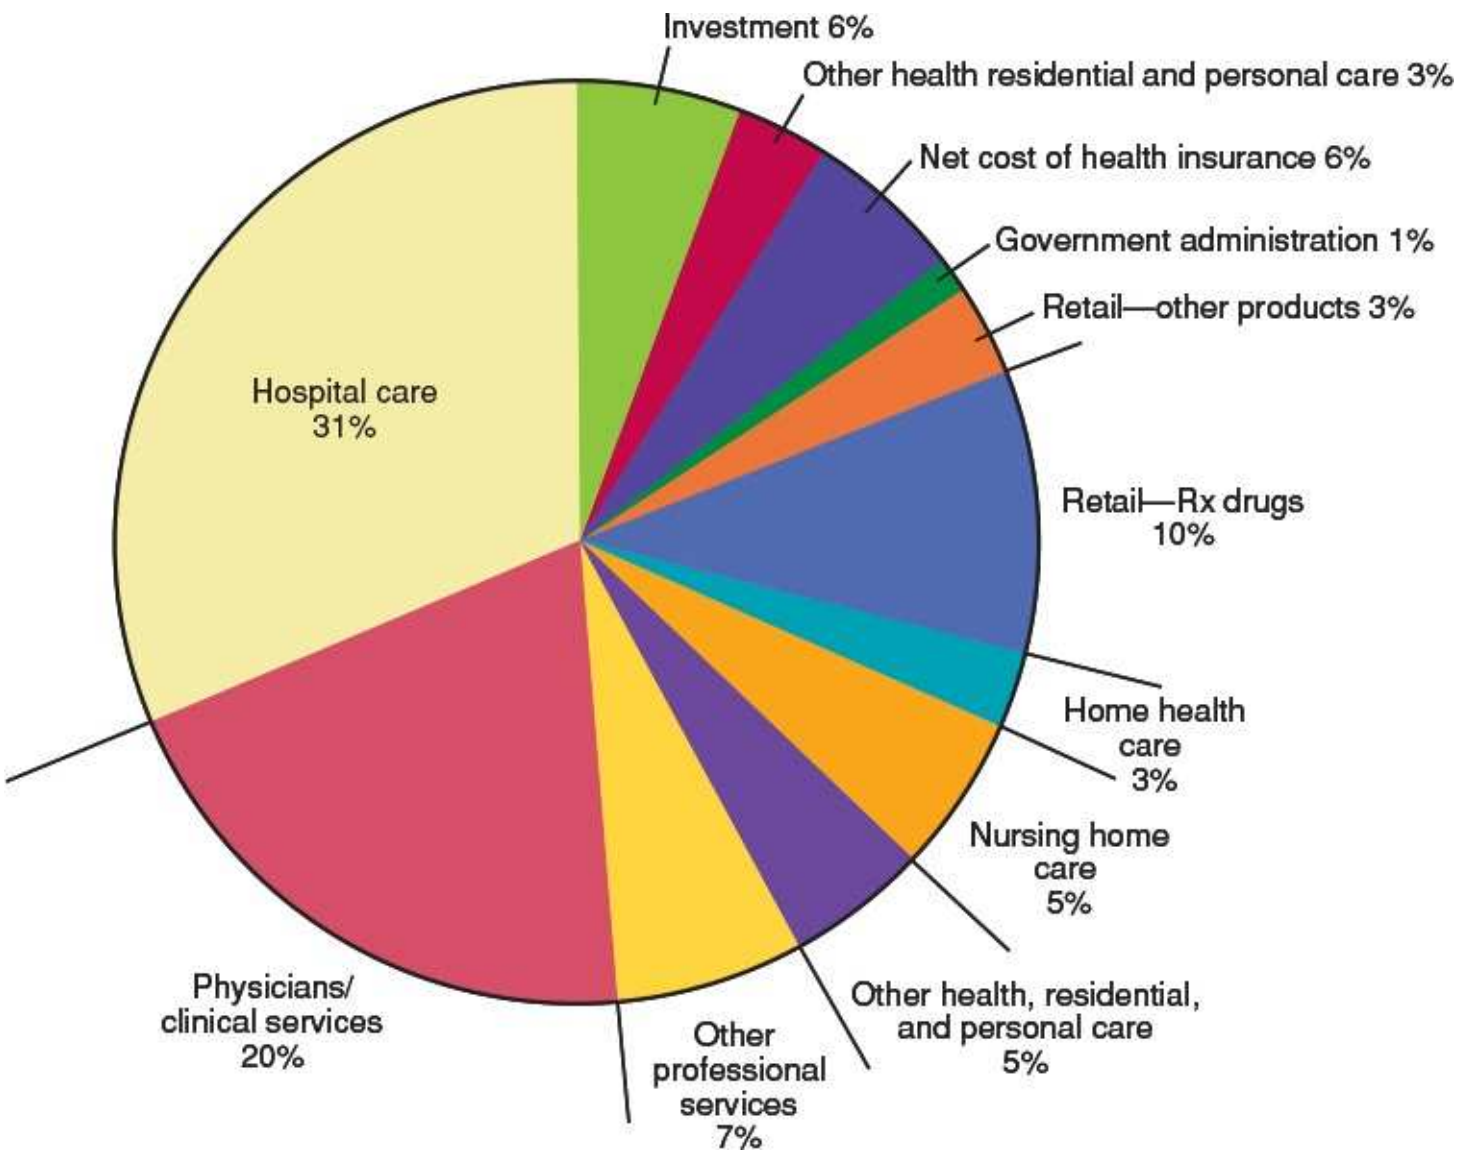

FIGURE 11-5. How the U.S. health care dollar is spent.

How the U.S. Health Care Dollar Is Spent

Hospital care and health care provider/clinical services together account for 51% of the nation's health care expenditures. With greater understanding of the social determinants of health (see Chapter 3 and Fig. 11-10 later in this chapter), everyone is trying to figure out how to get more health care dollars out of the hospital and into the community to promote health and prevent illness. This is an ongoing challenge. Figure 11-5 shows a pre–COVID-19 breakdown of

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

how the U.S. health care dollar was spent. During the pandemic hospital revenues were reduced dramatically as the public skipped annual health screenings and delayed elective surgeries and treatment. The IOM report, *Best Care at Lower Cost* concluded that a substantial proportion of U.S. health care expenditures is wasted, leading to little improvement in health or the quality of care. The IOM workshop summary, *The Health Care Imperative: Lowering Costs and Improving Outcomes,* estimates excess costs in six domains: unnecessary services, services inefficiently delivered, prices that are too high, excess administrative costs, missed prevention opportunities, and medical fraud (Yong et al., 2010). Figure 11-6 illustrates how commercial health plans spend each of your premium health care dollars.

How the U.S. Health Care System Compares Internationally

The 2010 Commonwealth Fund International comparison of the U.S. health care system concluded that despite having the costliest health system in the world, the United States consistently underperforms in most dimensions of performance relative to other countries. "Compared with six other nations—Australia, Canada, Germany, the Netherlands, New Zealand, and the United Kingdom—the U.S. health care system ranks last or next-to-last in five dimensions of a high-performance health system: quality, access, efficiency, equity, and healthy lives" (Davis et al., 2010). The report was hopeful that newly enacted health reform legislation in the United States would address these problems by extending coverage to those without and helping to close gaps in coverage, leading to improved disease management, care coordination, and better outcomes over time. A 2015 Commonwealth Fund brief showed that—before the major provisions of the ACA were introduced—the United States had worse outcomes and spent more on health care, largely because of greater use of medical technology and higher prices, compared to other high-income countries. By benchmarking the performance of the U.S. health care system against other countries—and by updating with new data as they become available—we could gain important insights into our strengths and weaknesses and help policymakers and delivery system leaders identify areas for improvement. Sobering highlights of the report include:

- The United States spends more on health care as a share of the economy—nearly twice as much as the average Organisation for Economic Co-operation and Development (OECD) country—yet has the lowest life expectancy and highest suicide rates among the 11 nations.
- The United States has the highest chronic disease burden and an obesity rate that is two times higher than the OECD average.
- Americans had fewer physician visits than peers in most countries, which may be related to a low supply of physicians in the United States.
- Americans use expensive technologies, such as MRIs, and specialized procedures, such as hip replacements, more often than our peers.
- The United States outperforms its peers in terms of preventive measures—it has one of the highest rates of breast cancer screening among women ages 50 to 69 years and the second-highest rate (after the United Kingdom) of flu vaccinations among people age 65 and older.
- Compared to peer nations, the United States has among the highest number of hospitalizations from preventable causes and the highest rate of avoidable deaths.

FIGURE 11-6. How commercial health plans spend each of your premium health care dollars. (*Source*: This data represent how commercial health plans spend your premiums. Used with permission, AHIP. https://www.ahip.org/health-care-dollar/)

A similarly discouraging 2013 IOM report, *U.S. Health in International Perspective: Shorter Lives, Poorer Health,* concludes that while the United States is among the wealthiest nations in the world, it is far from the healthiest. Despite spending far more per person on health care than any other nation, the United States has more people dying at younger ages than people in almost all other high-income countries. Among 16 peer nations, all affluent democracies, the United States is at or near the bottom in nine key areas of health: infant mortality and low birth weight, injuries and homicides, teenage pregnancies and sexually transmitted infections (STIs), prevalence of HIV and AIDS, drug-related deaths, obesity and diabetes, heart disease, chronic lung disease, and disability. Included as factors linked to the U.S. disadvantage are inadequate health care, unhealthy behaviors, and adverse economic and social conditions. "The tragedy is not that the U.S. is losing a contest with other countries, but that Americans are dying and suffering from illness and injury at rates that are demonstrably unnecessary" (Woolf & Aron, 2013).

An important study from the 2020 social progress index shows that the quality of life in the United States has dropped over the last decade (2020 Social Progress Index: https://www.socialprogress.org/?tab=2&code=USA). Out of 163 countries assessed worldwide, the United States, Brazil, and Hungary are the only ones in which people are worse off than when the index began in 2011. The United States ranks No. 1 in the world in quality of universities but No. 91 in access to quality basic education. The United States leads the world in medical technology, but we are No. 97 in access to quality health care. The data for the 2020 index predates COVID-19, which has had a disproportionate impact on the United States and seems likely to exacerbate the slide in America's standing.

HEALTH CARE REFORM

On March 23, 2010, President Obama signed comprehensive health reform legislation, the Patient Protection and Affordable Care Act (PPACA), into law. The intent of the law was to expand coverage, control health care costs, and improve the health care delivery system. While the law is complex, nurses should be familiar with how the law affects their practice, health care delivery, and the choices available to the public. Excellent information about the law can be found at www.healthcare.gov and www.nursingworld.org.

The American Nurses Association website chronicles nurses' decades-long efforts to advocate for health care reforms that would guarantee access to high-quality health care for all. It acknowledges that with the passage of the PPACA, millions now have greater protection against losing or being denied health care coverage and better access to primary and preventive services. It also reminds us that the debate about health care is not over and offers practical strategies for nurses who choose to be politically active for continuing reform. The 2016 ANA Principles for Health System Transformation include the following:

Box 11-2 Nurses Can Make a Difference in Health Care Policy and Reform

- Stay informed about current issues and pending legislation.
- Write or e-mail members of Congress to support legislation to improve nursing and patient care. See Chapter 7.
- Belong to and participate in nursing organizations.
- Document the outcomes of nursing care and develop a database to influence health care costs and quality of care.
- Participate in efforts to design and implement innovative health care delivery models.
- Be a leader in local, state, and national nursing and consumer groups.
- Advocate for the rights of all people for equal, affordable, accessible, and knowledgeable health care.

. Ensure universal access to a standard package of essential services for all citizens and residents.
. Optimize primary, community-based, and preventive services while supporting the cost-effective use of innovative, technology-driven, acute, hospital-based services.
. Encourage mechanisms to stimulate economic use of health care services while supporting those who do not have the means to share in costs.
. Ensure a sufficient supply of a skilled workforce dedicated to providing high-quality health care services.

Check out the ANA website (http://www.nursingworld.org/MainMenuCategories/Policy-Advocacy/HealthSystemReform) to see the many resources ANA provides for nurses passionate about health care reform. See Box 11-2 for examples of ways that nurses can promote health care reform.

ORGANIZING HEALTH CARE: PRIMARY, SECONDARY, AND TERTIARY CARE

Health care can be broken down into three levels: primary, secondary, and tertiary (Table 11-2). While these divisions seem simple, it is challenging to decide what resources should be allocated to each level. Many claim that the United States has an illness care system rather than a health care system. As a result, a disproportionate percentage of our health

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

care dollar goes to secondary and tertiary care at the expense of prevention and primary care. More attention is now being paid to prevention and primary care, and new opportunities are opening up for nurses at all levels of practice. If care coordination entails not only the right care for the right patient at the right time but also the right provider, decisions about how to organize care must also address which providers are best able to deliver affordable, safe, high-quality care.

Table 11-2 Primary, Secondary, and Tertiary Health Care

CARE LEVEL	GOAL	PRACTITIONER	PRACTICE SITE	ACTIVITIES
Primary Health Care	Common health problems (sore throats, diabetes, arthritis, depression, or hypertension) and preventive measures (vaccinations, mammograms) that account for 80–90% of visits to clinicians	Family practice physicians Nurse practitioners Midwives	Family planning centers Primary care centers Urgent care centers Employment health centers	Family planning Prenatal and well-baby care Immunization against specific diseases Health risk screenings Diagnostic tests Health education Medications
Secondary Health Care	Problems that require more specialized clinical expertise, such as hospital care for a patient with a myocardial infarction or stroke	Physicians in specialties such as internal medicine, pediatrics, neurology, psychiatry Advance practice nurses	Hospital-based clinics Emergency departments Hospitals Psychiatric institutes Same-day surgery units	Disease identification and management
Tertiary Health Care	Management of rare and complex disorders such as pituitary tumors and congenital malformations	Subspecialist physicians such as cardiovascular surgeons, pediatric hematologists Advance practice nurses	Tertiary care medical centers	Rare and complex disease management

Source: Adapted from Bodenheimer, T., & Grumbach, K. (2016). *Understanding health policy: A clinical approach* (7th ed.). McGraw-Hill.

The IOM study report, *The Future of Nursing, Leading Change, Advancing Health* (2011), calls on private and public funders, health care organizations, nursing education programs, and nursing associations to expand opportunities for nurses to lead and manage collective efforts with health care providers and other members of the health care team to conduct research as well as redesign and improve practice environments and health systems. Recognizing the key role nurses play in the health of Americans, the National Academies of Sciences, Engineering, and Medicine is currently working on a consensus report, *The Future of Nursing 2020–2031*, that charts a path for the nursing profession to help the United States create a culture of health, reduce health disparities, and improve the health and well-being of the U.S. population in the 21st century. This committee is considering newly emerging evidence related to the COVID-19 pandemic, and the report includes recommendations regarding the role of nurses in responding to the crisis created by a pandemic (https://www.nationalacademies.org/our-work/the-future-of-nursing-2020-2030). This is an exciting time to be a nurse. See the accompanying display, Through the Eyes of a Nurse.

Through the Eyes of a Nurse

Asked to describe what keeps me up at night, I spoke about an upcoming summit … one in which health care innovation would be featured prominently as part of a conversation about health care reform. I spoke about my concern, as the sole nurse leader in attendance, whether the space would be created in such an important forum for a larger conversation to take place—about how, in the face of emerging technologies and provider shortages, we can better utilize our health care workforce for potentially tens of millions who, under the Affordable Care Act, will likely soon find themselves with improved access to care.

… I believe the greatest challenge for nurse leaders is to influence the culture of care so that patients are able to optimally benefit from the knowledge, competencies, and skills of nurses. Nurses bring unique cost-saving value to health care and have the capacity to be system innovators. I believe nurses must be empowered to participate as leaders in care delivery redesign to assure changes will be meaningful for patients. And yet, nurses remain on the periphery of many policy and reform conversations.

- Care coordination managed by nurses decreases costs. One IOM-commissioned study published in 2011 showed uncoordinated care raises costs by 75%, compared to similar cases with coordinated care.
- There is a strong link between patient satisfaction, nurse staffing, and revenue. Thirty percent of Medicare value-based performance scores are based on patient satisfaction scores (HCAHPS)—the single most important aspect of which is patient perceptions of excellent nursing care. In addition, increasing the proportion of RNs providing care

within the team improves patient outcomes (decreased falls, reduced rates of complications, and lower mortality) and costs.
- Expanding access to advance practice registered nurses (APRNs) will provide additional primary coverage to people who otherwise find it difficult or impossible to have timely access to primary care.
- Women who deliver with midwives have fewer C-sections and higher breastfeeding rates, pointing to the cost effectiveness of midwifery services. A 2011 Agency for Healthcare Research and Quality brief found that the cost of a cesarean delivery was almost $2,000 higher than for a vaginal delivery. Considering there are approximately four million births per year in this country and 32% are delivered by C-section, that is a total of $2.5 billion per year. Reducing this number by even 5% by increasing access to midwifery care for low-risk pregnancies would result in about $128 million in savings on hospitalizations alone.

These are just a few of the compelling arguments with respect to the value of nurses.

—Karen A. Daley, PhD, RN, FAAN, President, American Nurses Association

ORGANIZING HEALTH CARE: HEALTH CARE DELIVERY SYSTEMS AND CARE COORDINATION

For a long time, health care delivery in the United States has been characterized by fragmentation at the national, state, community, and practice levels. A 2008 Commonwealth Fund study (Shih et al., 2008) found that:

- Patients and families navigate unassisted across different providers and care settings, fostering frustrating and dangerous patient experiences.
- Poor communication and lack of clear accountability for a patient among multiple providers lead to medical errors, waste, and duplication.
- The absence of peer accountability, quality improvement infrastructure, and clinical information systems foster poor overall quality of care.
- High-cost, intensive medical intervention is rewarded over higher-value primary care, including preventive medicine and the management of chronic illness.

As you read about the following delivery systems, note that great progress is being made to address this fragmentation, and nurses are playing ever more important roles in care coordination. See Chapter 12 for a discussion of the nurse navigator role. As noted in Chapter 1, the IOM report on nursing (IOM, 2011, p. ix) states that "accessible, high quality care cannot be achieved without exceptional nursing care and leadership."

Health Care Providers and Hospitals

Until recently in the United States, most medical care was delivered by fee-for-service private health care providers in solo or small group practices. Most hospitals were not-for-profit community hospitals. Health care providers, who were rarely employees of the hospital, wielded great power because hospitals depended on the patients whom health care providers admitted or referred for treatment. Under a **fee-for-service** arrangement (in which everything a provider "does" for a patient leads to a bill generated and a fee paid), financial incentives reward doing more care, not necessarily better care.

Multispecialty Group Practice

As new drugs and technologies proliferated, it became increasingly difficult for general practitioners of medicine to provide all the services their patients needed. In the late 1800s, when the Mayo Clinic was founded in Rochester, Minnesota, health care providers from different specialties united to share income, expenses, facilities, equipment, and support staff. The **multispecialty group practice** that resulted was better able to provide comprehensive care. While the Mayo Clinic generally served as a referral center, other multispecialty centers developed to serve specific communities.

Community Health Centers

Community health centers are regionalized services for vulnerable geographic populations with an emphasis on primary care and education. Their primary objective is to ensure that everyone who needs care has access regardless of the ability to pay. Most of these services rely on nurses to provide primary care. Mary Breckinridge's Frontier Nursing Service, which successfully served a poor rural area in Kentucky that lacked basic medical and obstetric care, was a pioneer organization at its inception in the 1920s.

Today the National Association of Community Health Centers (www.nachc.com) reports that community health centers serve the primary health care needs of more than 22 million patients in over 9,000 locations across the United States. According to NACHC, these health centers play a crucial role during tough economic times, providing affordable

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

health services for millions of uninsured and newly jobless Americans. Community health centers save money every time an uninsured patient opts for an examination and treatment at the first sign of a health issue instead of waiting until a costly emergency room visit is the only option. These centers also save money for Americans looking for work whose families could otherwise face poor health without care or large medical debts.

Prepaid Group Practice

Health maintenance organizations (HMOs) are prepaid, group-managed care plans that allow subscribers to receive all the medical services they require through a group of affiliated providers. There may be no additional out-of-pocket costs, or subscribers may pay only a small fee, called a copayment. An HMO may employ all its providers (including health care providers), or it may be a group of clinicians in alliance who provide care as independent practitioners. In most HMOs, the patient does not have a choice about health care providers but receives all services from clinicians who are associated with or part of the HMO. HMOs often have a goal of primary care to reduce costs by preventing illness. HMOs are popular with large employers who support the concept of **managed care**, and they are also associated with Medicare in some states.

Preferred provider organizations (PPOs) allow a third-party payer (facilities that pay health care providers for services provided to people, such as a health insurance company) to contract with a group of health care providers to provide services at a lower fee in return for prompt payment and a guaranteed volume of patients and services. Although patients are encouraged to use specific providers, they may also seek care outside the panel without referral by paying additional out-of-pocket expenses. One type of PPO is called a preferred provider arrangement, in which a contract is made with an individual health care provider rather than with a group of providers. Similarly, a point-of-service plan encourages the use of specified health care providers and services but pays a portion of expenses for referrals made to health care providers outside the organization by the patient's primary care health care provider.

Accountable Care Organizations

One of the more innovative models of care delivery to emerge from the PPACA is the **accountable care organization (ACO)**. This new organizational structure is a departure from the traditional fee-for-service model of reimbursement. In the fee-for-service model, providers are incentivized to do more and more, but not necessarily in a coordinated manner. ACOs turn this model around by offering incentives to provide integrated, well-coordinated care to patients.

ACOs are made up of several types of organizations that deliver care: hospitals, primary care settings, and specialty care practices. Together, the organizations in an ACO come together to deliver the most efficient and high-quality care for the population served; only one bill is generated that covers *all* the care delivered across the various settings (e.g., before the hospitalization, during the inpatient stay, and after discharge from the hospital). In addition, when providers (hospitals and outpatient practice settings) deliver higher quality and more efficient care, they share in the savings from delivering well-integrated care.

Because nurses have the skill set to coordinate care across settings, they are especially well suited to make a real contribution to improved population health within ACOs.

Medical Homes to Medical Neighborhoods

A **medical home** is an enhanced model of primary care that provides whole-person, accessible, comprehensive, ongoing, and coordinated patient-centered care. Figure 11-7 illustrates a conceptual model for a medical home oriented to the Institute for Health Improvement's Quadruple Aim. First advanced by the American Academy of Pediatrics in the 1960s, the medical home concept gained momentum in 2007 when four major physician groups agreed to a common view of the patient-centered medical home (PCMH) model (AHRQ, 2013). The 2012 Patient-Centered Primary Care Collaborative research project demonstrated that the data about PCMHs are clear, consistent, and compelling: "The PCMH improves health outcomes, enhances the patient experience of care and reduces expensive, unnecessary hospital and ED care" (Nielsen et al., 2012).

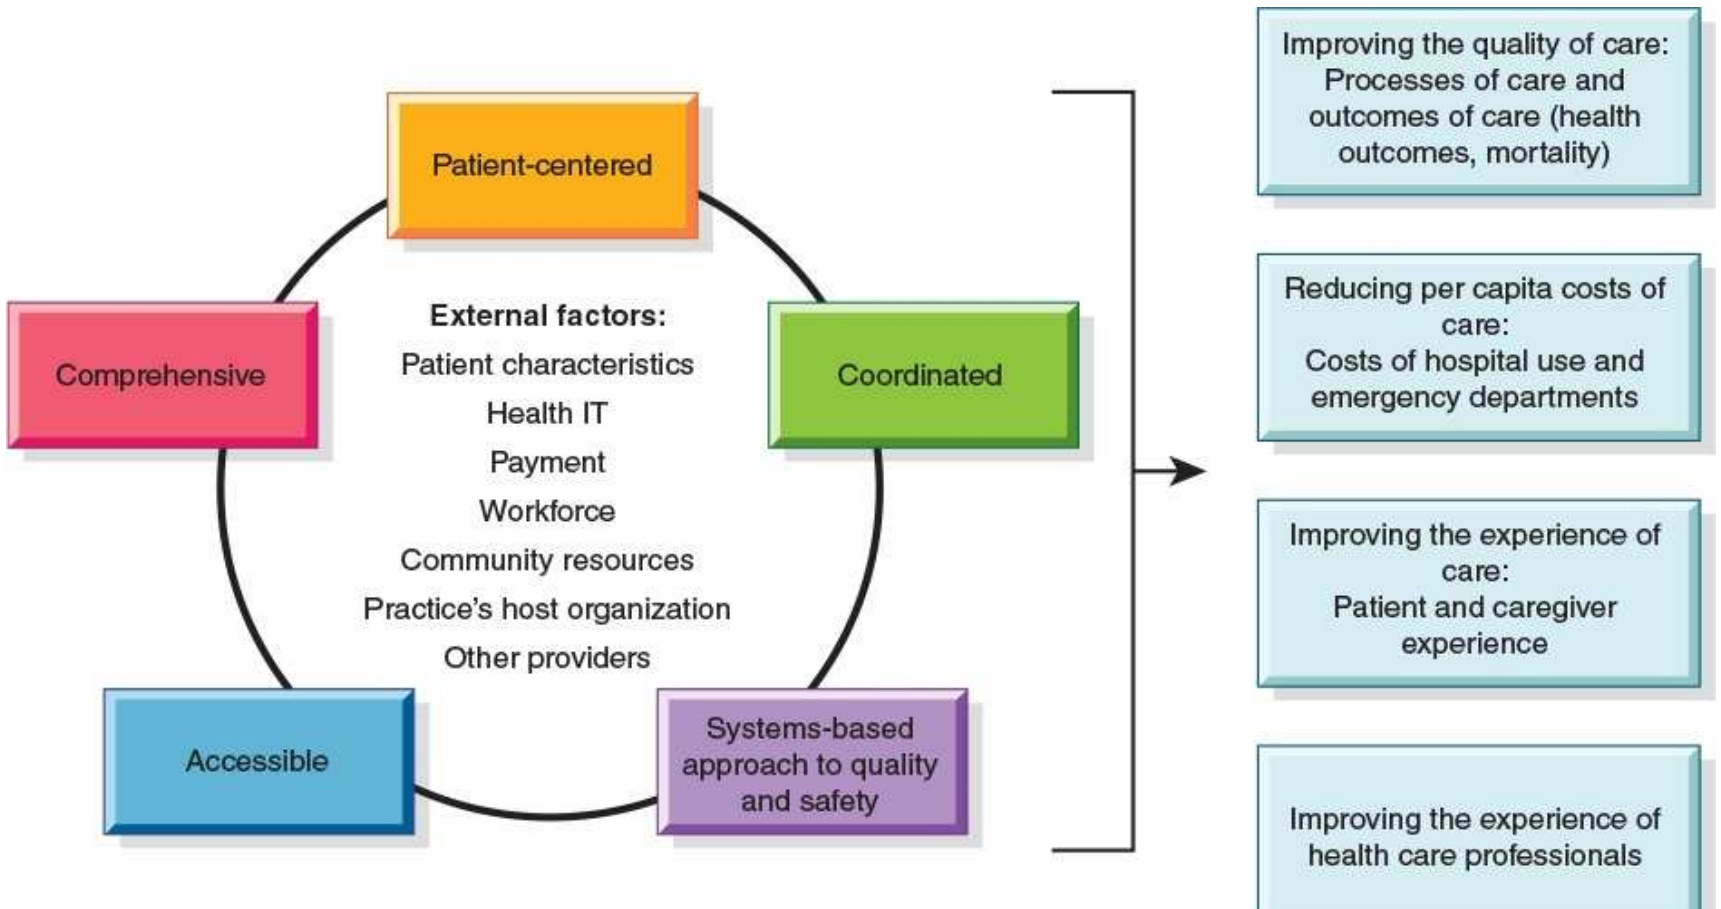

FIGURE 11-7. Conceptual framework for the effectiveness of the medical home. (*Source:* Used with permission. Agency for Healthcare Research and Quality. [2013]. The medical home: What do we know, what do we need to know? A review of the earliest evidence on the effectiveness of the patient-centered medical home model. AHRQ Publication No. 12-0020-1-EF.)

A 2011 Agency for Healthcare Research and Quality (AHRQ) white paper defines a **medical neighborhood** as a PCMH and the constellation of other clinicians providing health care services to patients within it, along with community and social service organizations as well as state and local public health facilities (Fig. 11-8 on page 286). Defined in this way, the PCMH and the surrounding medical neighborhood can focus on meeting the needs of the individual patient but also incorporate aspects of population health and overall community health needs in its objectives (Taylor et al., 2011, p. 5). But despite all our efforts to improve health care, the report starkly concludes:

> The medical neighborhood in its current form is highly fragmented, with little coordination among the myriad clinicians and institutions … primary care—and increasingly a PCMH as the provider of that primary care—should be at the core of the neighborhood, but for many patients it is not. Without a medical home, patients and their families often are left to navigate the system on their own. The current functioning of the neighborhood largely reflects the fee for service environment—in which few or no incentives exist for care coordination activities—and a historical emphasis on specialty-based medical practice in independent small groups or solo practice. Other factors, however, including existing professional norms and a lack of tools to share information across clinicians, also play a role in the way the medical neighborhood currently functions.

Care Coordination

The AHRQ Care Coordination Measures Atlas acknowledges that there is no consensus definition for care coordination but offers the following (McDonald et al., 2010):

> **Care coordination** is the deliberate organization of patient care activities between two or more participants (including the patient) involved in a patient's care to facilitate the appropriate delivery of health care services. Organizing care involves the marshaling of personnel and other resources needed to carry out all required patient care activities and is often managed by the exchange of information among participants responsible for different aspects of care.

Nurses are critical to the success of any care coordination strategy. Chapter 12 explores this topic more fully.

PAYING FOR HEALTH CARE

Few citizens can afford to pay for health care from their own resources. The costs of most people's health care are covered by public or private health insurance. The four basic modes of paying for health care are out-of-pocket payment, individual private insurance, employer-based group private insurance, and government financing.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

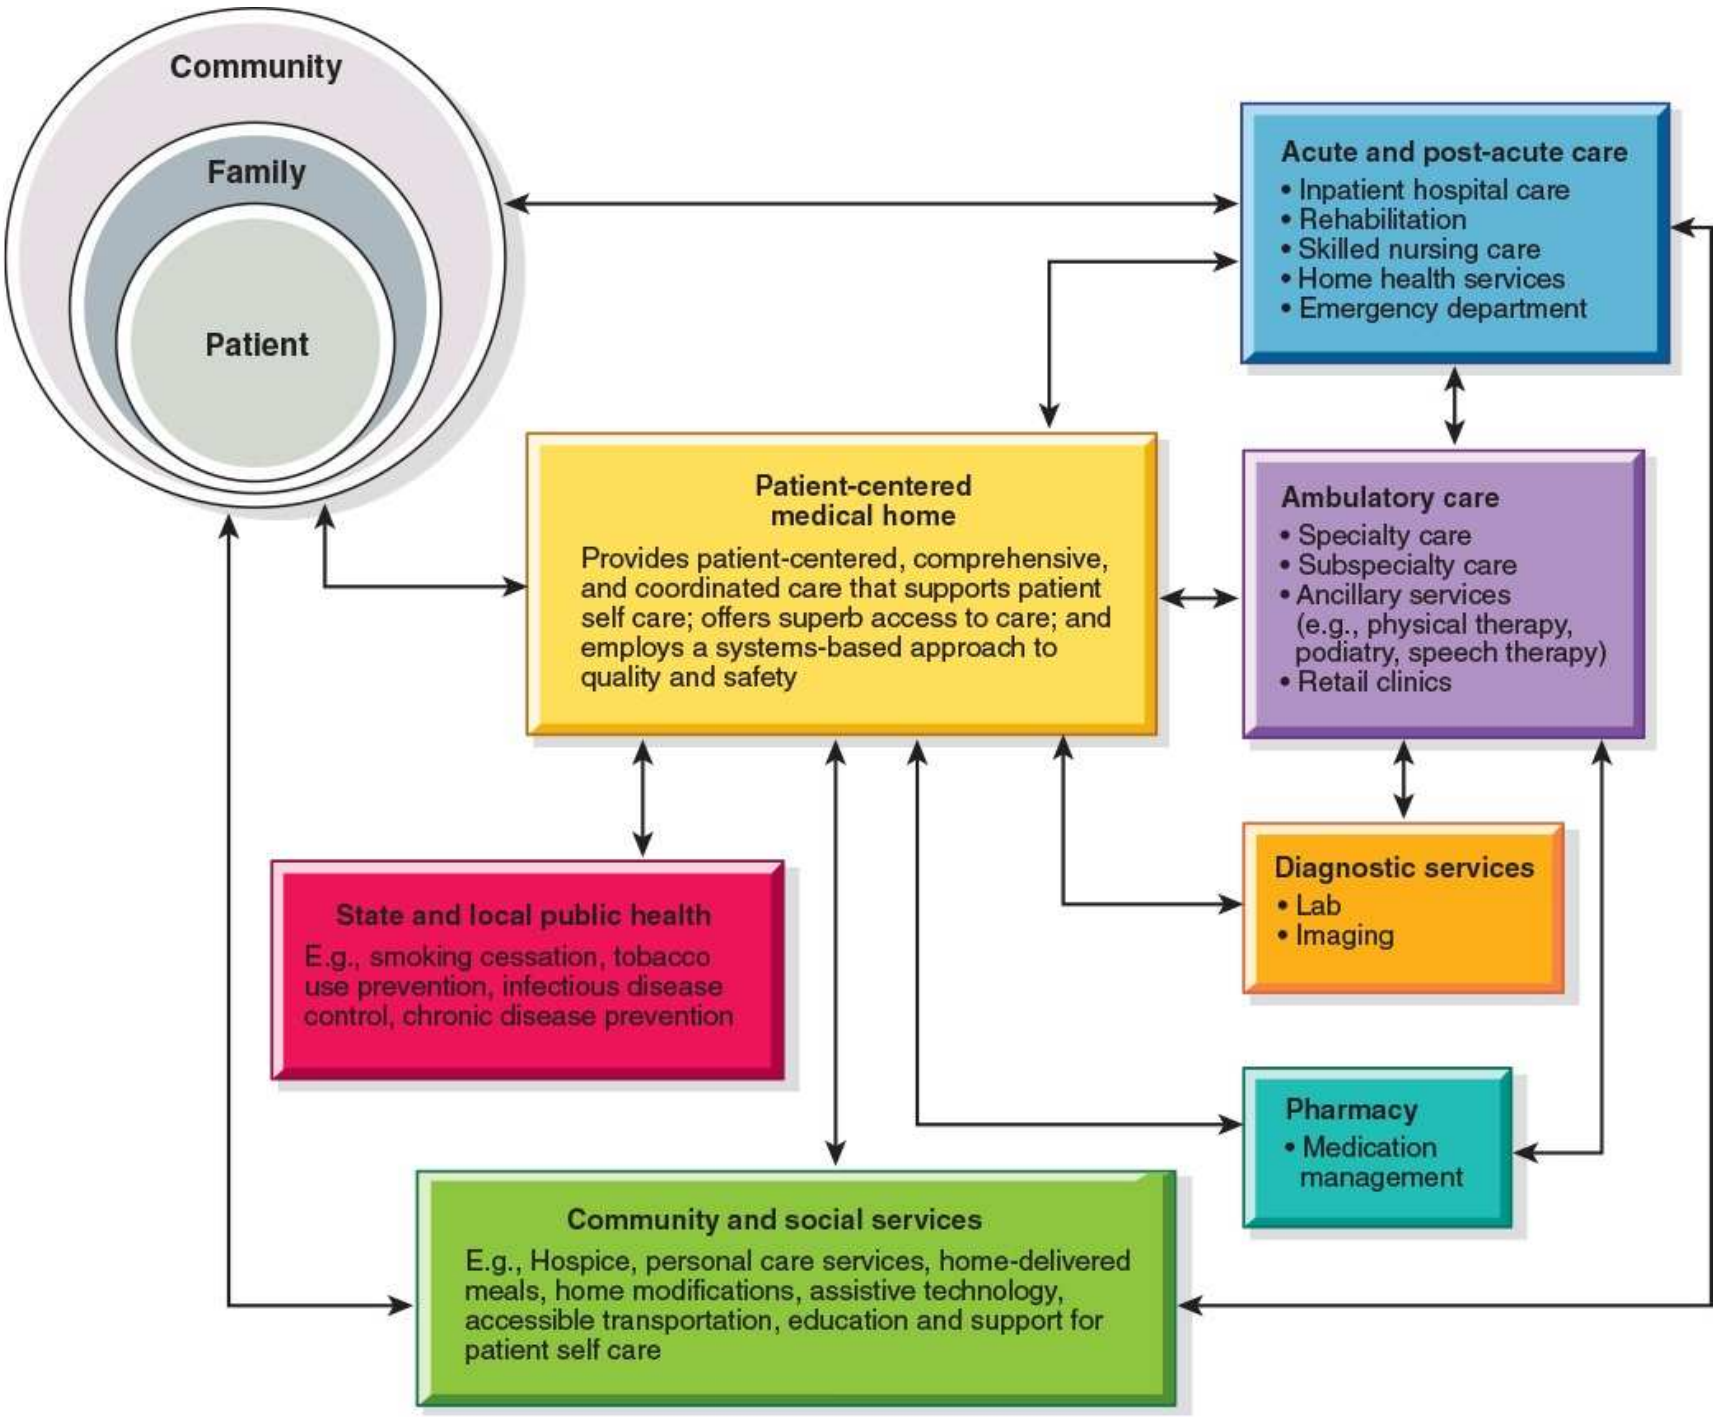

FIGURE 11-8. Medical neighborhood. (*Source:* Reprinted with permission from Taylor, E. F., Lake, T., Nysenbaum, J., Peterson, G., & Meyers, D. [2011]. *Coordinating care in the medical neighborhood: critical components and available mechanisms. White Paper [Prepared by Mathematica Policy Research under Contract No. HHSA290200900019I TO2]. AHRQ Publication No. 11–0064*. Agency for Healthcare Research and Quality.)

Out-of-Pocket Payment

During the first half of the 20th century, most Americans paid for health care with cash payments. This simple method of financing is increasingly rare because today most families cannot afford the high costs of health care. Most Americans continue to believe that the basic health care needs of all should be met regardless of ability to pay.

Individual Private Insurance

Personal health care can be financed by private insurance through large, nonprofit, tax-exempt organizations or through smaller, private, for-profit insurance companies. To be insured, members pay monthly premiums either by themselves or in combination with employer payments. These plans are called third-party payers because the insurance company pays all or most of the cost of care. The premiums on private insurance plans tend to be higher than those for managed care plans, but members can choose their own health care providers and services desired.

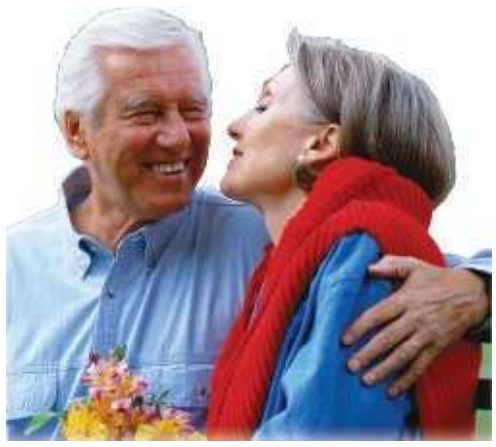
Employer-Based Private Insurance

Employer-sponsored coverage remains the most common source of health care coverage in the United States. In 2014, 66% of nonelderly workers received an offer of coverage from their employer—less than the 71% rate in 1999. Employees who worked part time were less likely to be offered coverage from their employer than were employees working full time. The percentage of workers covered has declined over the last 15 years, and the decline is greatest among families with low and modest incomes (Long et al., 2016).

Government Financing

The largest federally funded health care programs are Medicare and Medicaid. Other federally funded programs include the Children's Health Insurance Program (CHIP) and the Veteran's Health Administration (VHA).

Medicare



The 1965 **Medicare** amendments to the Social Security Act established national and state health insurance programs for

older adults under Title XVIII. Within a decade, almost all citizens over 65 years of age held Medicare insurance for hospital care, extended care, and home health care. Medicare coverage was increased in 1972 to include permanently disabled workers and their dependents, if they also qualified for Social Security benefits.

In 1983, Medicare converted to a prospective payment plan based on patient classification categories, called **diagnosis-related groups (DRGs)**. The federal government implemented DRGs in an effort to control rising health care costs. The plan pays the hospital a fixed amount that is predetermined by the medical diagnosis or specific procedure rather than by the actual cost of hospitalization and care. Medicare was expanded in 1988 to include catastrophic care costs and expensive medications.

In 2007, based on changes in DRGs made by the CMS, the criteria for reimbursement to hospitals became severity of illness and projected cost of care. The plan pays only the amount of money preassigned to a treatment for the diagnosis (e.g., an appendectomy); if the cost of hospitalization is greater than that assigned, the hospital must absorb the additional cost. If the cost is less than that assigned, the hospital makes a profit. In addition, Medicare no longer reimburses hospitals for conditions that result from preventable errors and lead to increased costs. Such conditions include pressure injuries, injuries caused by falls, infections associated with indwelling urinary catheters, vascular catheter–associated infections, infections of the mediastinum after coronary artery bypass graft, air embolisms, adverse reactions to incompatible blood infusions, and sponges or instruments left inside a patient during surgery.

People who receive Medicare pay both a deductible cost and a monthly premium for full insurance coverage. Part A of Medicare, which pays most inpatient hospital costs, is paid by the federal government. Part B of Medicare, which is voluntary, is paid by a monthly premium; it covers most outpatient costs for physician visits, medications, and home health services. Because the full cost of some services is not covered by Medicare, a supplemental insurance policy offered by a private insurance company is recommended. Also, because Medicare is federally funded, benefits may change annually according to Congressional decisions related to the federal budget. There continues to be talk about "phasing out" Medicare. In the second decade of the 21st century there continues to be a national debate about whether the United States can continue to operate Medicare in the same form along with other government programs and still control spiraling health care costs. In the United States, as in other countries, **entitlement reform** is being considered for benefits paid by the government to citizens in order to improve the national budget and reduce debt. See Medicare and You (2016), available at https://www.medicare.gov/Pubs/pdf/10050.pdf.

Remember **Margaret Ritchie**, the older adult woman caring for her husband at home. Most likely, she and her husband have Medicare. Medicare does pay for home health care services if the patient meets specific criteria. However, Medicare does not cover all equipment that may be necessary. Medicare does not pay for nursing home care.

Medicaid

Medicaid was established in 1965 under Title XIX of the Social Security Act. Medicaid is a federally funded public assistance program for people of any age who have low incomes; for blind, older adult, and disabled people covered by supplemental security benefits; and for beneficiaries of Aid to Families with Dependent Children. This coverage depends on individual state regulations. Visit www.medicaid.gov to learn more about this program.

Current budgetary considerations are leading state and federal facilities to trim Medicaid expenditures. The rapid growth of an aging population and an increased number of people experiencing poverty, many of whom are women and children, are draining the Medicaid budget. In an attempt to survive, Medicaid programs are implementing changes such as reducing benefits or placing patients into managed care programs.

Children's Health Insurance Program

The CHIP, formerly the State Children's Health Insurance Program (SCHIP), was created by the Balanced Budget Act of 1997, was enacted as Title XXI of the Social Security Act, and has allocated about $20 billion over 10 years to help states insure low-income children who are ineligible for Medicaid but cannot afford private insurance. States receive an enhanced federal match (greater than the state's Medicaid match) to provide this coverage. In 2007 the program was extended, and in 2009 was reauthorized by Congress and signed by President Obama. Together, Medicaid and CHIP serve more than 42 million children who would otherwise not have access to regular medical care. While Medicaid and

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

CHIP have helped bring the rate of uninsured children to the lowest level in more than two decades, many more children are eligible but not covered as of yet.

Veterans Health Administration

The Veterans Health Administration is home to the United States' largest integrated health care system, consisting of 152 medical centers, nearly 1,400 community-based outpatient clinics, community living centers, veterans' centers, and domiciliaries. Together these health care facilities and the more than 53,000 independent licensed health care practitioners who work within them provide comprehensive care to more than 8.3 million veterans each year. The VHA has an annual medical care appropriation of more than $47 billion.

HEALTH CARE SETTINGS AND SERVICES

Health care is provided within many different types of facilities to meet the varying needs of people. When one considers that only patients who require complex surgery, those who are acutely ill or seriously injured, and some who are having babies are hospitalized—and then only for a minimum period of time—it is apparent that most health care services are provided in settings outside the hospital. These settings include clinics, homes, schools, prisons, daycare centers for children and older adults, crisis-intervention centers, mental health centers, drug and alcohol rehabilitation programs, storefront clinics, and churches.

Hospitals

There are approximately 5,000 community hospitals in the United States. Community hospitals are short-term, general, nonfederal, and special (e.g., orthopedic, cancer, and academic medical center) hospitals. Each year, community hospitals admit more than 35 million people, treat nearly 118 million people in their emergency departments, and deliver over 4 million babies (American Hospital Association, 2020). Most hospital stays are short, although longer stays occur in patients who have serious infections, major trauma, mental illnesses, and cardiovascular diseases. Today's shorter hospital stays have resulted from many factors, including improved treatment of diseases, an increased emphasis on preventive care, federal regulations, and other health care reimbursement policies. The shorter stay means that most hospital care is focused on the acute care needs of the patient. Nurses play a critical role in ensuring that patients and their family caregivers are prepared to meet their health care needs by the time of discharge.

Classification

Hospitals are classified as public or private, and as for profit or nonprofit. Public hospitals, which are nonprofit institutions, are financed and operated by local, state, or national facilities. Patients admitted to a public hospital may not have health insurance, and services are provided at little or no cost to the patient. Tax revenue or public funds cover the cost. Private hospitals may be for profit or nonprofit and are operated by communities, churches, corporations, and charitable organizations. The Catholic health ministry is the largest group of nonprofit health care providers in the nation. Every day one in six patients in the United States is cared for in a Catholic hospital. Many patients cared for in private hospitals have some type of personal health insurance or health care plan.

Size and Services

Hospitals range in size from as few as 20 beds to large medical centers with hundreds of beds. Various services are provided, depending on the size and location of the hospital. Most hospitals provide emergency care, inpatient care, surgery, diagnostic tests, and patient education. Other hospital services may include intensive care, obstetric care, palliative care, social services, outpatient clinics and surgery, educational programs, and long-term skilled nursing care facilities. Hospitals may provide care for all types of illnesses and trauma or may specialize in the treatment of certain types of illness. Specialty hospitals, or special units in general hospitals, meet the varied needs of certain patient groups such as children and patients of all ages needing rehabilitation, cancer care, psychiatric or drug-dependency care, or patients with severe burns.

Inpatient and Outpatient Services

Hospitals provide both inpatient and outpatient services. An **inpatient** is a person who enters a hospital and stays overnight for an indeterminate time (from days to months). Hospitals also have many services for **outpatients**—those who are not hospitalized overnight but who require diagnosis or treatment. Patients who do not require inpatient care can receive treatment, care, and education on an outpatient basis. Examples of outpatient services include surgical procedures, diagnostic tests, medications, physical therapy, counseling, and health education. A form of hospital outpatient care occurs in short-stay units, where patients having diagnostic tests or surgery enter the hospital, have the procedure, and then return to the hospital room for a brief (1 to 6 hours) recovery period before going home. Patients may also be categorized as outpatients when they are admitted, treated, and discharged within 23 hours.

Nurses' Role in Hospitals

Although the trend is changing, hospitals still employ more nurses than any other type of facility. The percentage of RNs

working in hospitals is declining, but about 61% of RNs are still employed in hospitals (Bureau of Labor Statistics, U.S. Department of Labor, 2017). The U.S. Department of Labor projects that the number of RNs employed in hospitals will decrease while those employed in outpatient settings, home health, and long-term care will increase. Nurses employed in hospitals have many roles. Although many nurses are direct care providers, other roles include manager of other members of the health care team providing patient care, administrator, nurse practitioner, clinical nurse specialist, patient educator, in-service educator, and researcher.

The Magnet Recognition Program for Excellence in Nursing and the Pathway to Excellence Program are administered by the American Nurses Credentialing Center (ANCC), a subsidiary of the American Nurses Association. Magnet hospitals must meet strict requirements and standards that define the highest quality of nursing practice and patient care. A designation as a magnet hospital recognizes quality patient care, nursing excellence, and innovations in professional nursing practice (American Nurses Credentialing Center, 2020). See Chapter 10 for more about Magnet Hospitals.

Think back to **Maritza Cortes**, the mother who brings her daughter to the emergency department for care. The nurse in this situation acts primarily in the caregiver role. However, the nurse also plays a major role as educator, using knowledge about the infection to teach the mother about possible complications and the need for continued antibiotic treatment.

Primary Care Centers

Health care providers and advanced practice nurses provide primary health care services in offices and clinics. Services include the diagnosis and treatment of minor illnesses; performing minor surgical procedures; and providing obstetric care, well-child care, counseling, and referrals (Fig. 11-9). Federally qualified health centers (FQHCs), also known as community health centers, are nonprofit primary care clinics located in high-need areas across the country. Community health centers must serve everyone in the community, regardless of their health insurance and ability to pay, and often offer on-site mental health and dental services. An RN working in a health care provider's office makes health assessments, performs technical procedures, assists the health care provider, and provides health education and counseling.

Recall **Maritza Cortes**, the mother of the child with a strep throat. One might commonly think of primary health care services for typical childhood illnesses, but in this case, Ms. Cortes used the emergency department. Possibly, the mother thought that her child was too ill and needed to be seen immediately. In this case, the nurse would develop a teaching plan for Ms. Cortes about typical childhood illnesses. Maybe she did not know of anywhere else to obtain services. In this case, the nurse could contact social services to obtain information about community clinics for Ms. Cortes. Her finances may also have led to her decision to use the emergency department. In this case, the nurse also could contact social services to arrange for financial assistance.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

FIGURE 11-9. A nurse assesses a patient during a well-child visit at a primary care center. (*Source:* Used with permission from Shutterstock. *Photo by Monkey Business Images.*)

Advanced practice registered nurses (APRNs) are registered nurses educated at the master's or post-master's level in a specific role and for a specific population; examples include nurse practitioners, midwives, and clinical nurse specialists. APRNs work independently or collaboratively with health care providers to make assessments and care for patients who require health maintenance or health promotion activities. Depending on state regulations, APRNs may have their own offices and clinics to provide primary care and treatment to patients and refer only complex health problems to a health care provider.

Ambulatory Care Centers and Clinics

Ambulatory care centers and clinics (facilities that deliver outpatient medical care) may be located in hospitals or they may be freestanding services provided by a group of health care providers who work together. Ambulatory care centers and clinics are often located in convenient areas such as shopping malls or other community facilities. Many ambulatory care centers and clinics offer walk-in services so that appointments are unnecessary, and many are also open at times other than traditional office hours. They may be managed by an APRN. Small clinics staffed by APRNs are increasingly being established in nontraditional sites, such as drugstores and grocery stores. These clinics have dramatically improved access to care for the uninsured and those with other barriers to health care.

Nurses in ambulatory care centers and clinics provide technical services (e.g., administering medications), determine the priority of care needs, and provide teaching about all aspects of care. The urgent care center is a special type of ambulatory care center that provides walk-in care for illnesses and minor trauma. Outpatient or same-day surgical centers, discussed in Chapter 31, are another form of ambulatory care center.

Home Health Care

Home health care is one of the most rapidly growing areas of the health care system. Home health care may be provided through community health departments, visiting nurses' associations, hospital-based case managers, and home health facilities. These facilities provide many different health-related services, including skilled nursing assessment, teaching and support of patients and family members, and direct care for patients.

Home health care is important for many reasons. The prospective payment system of reimbursement encourages early discharge from the hospital, and has created a new, acutely ill population that needs skilled care at home. More older people are living longer and have multiple chronic illnesses, and with sophisticated technology people can live relatively comfortably in their own homes. Health care consumers demand that services be humane and that provisions be made for a dignified death at home. Read more about home care in Chapter 12.

Nurses who provide care in the home make assessments and provide physical care, administer medications, teach, and support family members. They also collaborate with other health care providers, such as physicians, physical therapists (PTs), occupational therapists, respiratory therapists (RTs), and social workers to plan and provide patient care. See Chapter 12.

Extended-Care Services

Extended-care services provide medical and nonmedical care for people with chronic illnesses or disabilities. Through a variety of facilities, and in conjunction with family members and other caregivers, extended-care services assist with activities of daily living for people of any age who are physically or mentally unable to care for themselves independently. In 2012, about 9 million people over the age of 65 used long-term care services; that number is projected to increase to 12 million by 2020.

Most extended care is provided to people by family or friends; for example, 70% of older adults requiring extended care are not in any type of facility. It is always helpful for nurses to be sensitive to the needs of family caregivers, who

often labor at great health and financial costs to themselves. Visit the Family Caregiver Alliance National Center on Caregiving website (www.caregiver.org) to learn more about the experiences of caregivers.

Extended care may last for periods ranging from days to years. Facilities that provide this care are often independent but may be associated with a hospital. Extended-care facilities include transitional subacute care, assisted-living facilities, intermediate- and long-term care facilities, homes for medically fragile children, retirement centers, and residential institutions for mentally and developmentally or physically disabled patients of all ages. One of the newest concepts in extended care is called "aging in place." In this type of care, patients remain in their homes or move to a living space, such as an apartment, while they are still physically able to care for themselves, and then have access to services that are a part of the health care community as needed as long as they live. What is essential for this health care paradigm is a community committed to meeting one another's needs. Also popular today are senior retirement communities. These residential care homes offer many options to older people. Some offer a range of services from independent apartment living to skilled nursing care, to match the needs of older adults as they age. Many also include memory care units for people with dementia who require specialized care.

Extended-care facilities have proliferated in recent years for two reasons. First, as many patients are discharged from the hospital earlier in their recovery period, they require care that is beyond the scope of home care. These patients receive transitional, subacute care in an extended-care facility. Second, as the population ages, many older adults will not have caregivers available and would be unable to carry out activities of daily living independently. Although extended-care facilities, especially long-term care facilities, have had a negative image in the past, much has changed. Most long-term care facilities focus on maintaining residents' function and independence, with concern for the living environment as well as the health care provided. A focus on maximizing the quality of life for residents has led to surroundings that include plants and animals as well as numerous intergenerational programs. Many of the overall improvements in long-term care resulted from the 1987 Omnibus Budget Reconciliation Act (OBRA), which included legislation to maintain standards of quality assurance in the long-term care industry.

Nurses can share the American Association of Retired Persons' (AARP) nine things to do before choosing a nursing home with families seeking a nursing home placement:

. Check the grounds. Perhaps most important—do you get a sense of security and safety? And, if your loved one enjoys being outdoors, are there nice sitting areas?
. Schmooze the residents and ask about living conditions and interactions with other residents.
. Talk with family members if they are willing to give their unvarnished opinions.
. Ask tough questions so you can get a real sense of the place and feeling for the culture.
. Check the staff turnover rates.
. Have a meal.
. Give a smell and sound test.
. Make a safety check.
. Visit again during off hours (Strauss, 2017).

Because patients entering extended-care facilities require so many different levels of care, it is difficult to generalize about the services provided. Those entering convalescent centers remain only until they have recovered. In some instances, an older adult may choose to move into a retirement or assisted-living facility that provides health care services only when needed. Other people who enter a long-term care facility may require complete care as long as they live. The nurse's roles in extended-care facilities may include being a provider of direct care, supervisor, administrator, safety or quality nurse, or teacher. Because most patients are older, increasing numbers of gerontology nurse specialists are contributing their knowledge and expertise to the care of these patients. Almost all extended-care facilities require that skilled nursing care be available at all times. The care given to patients can be performed only by or under the direct supervision of a licensed nurse.

Specialized Care Centers and Settings

Specialized care centers and settings provide services for a specific population or group. They are usually located in easily accessible locations within a community.

Daycare Centers

Daycare centers have a variety of purposes. Some centers care for healthy infants and children whose parents work; some also care for children with minor illnesses. Eldercare centers and senior citizen centers provide a place for older adults to socialize and to receive care while family members work. Some daycare centers provide health-related services and care to people who do not need to be in a health care institution but cannot be at home alone. Such centers provide services to older adults for physical rehabilitation, for people with functional needs (e.g., cerebral palsy), and for chemical dependency and mental health.

Nurses who work in daycare centers administer medications and treatments, conduct health screenings, teach, and counsel.

Mental Health/Behavioral Centers

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

A mental health center may be associated with a hospital or may provide services as an independent facility. The services provided may be crisis-centered or may involve long-term counseling. Patients receive outpatient care through a variety of interventions, including individual and group counseling, medications, and assistance with independent living. Crisis intervention centers are also mental health centers. They typically provide 24-hour services and hotlines for people who are suicidal, using drugs or alcohol, or in abusive situations. These centers also provide information and services for victims of rape and abuse. In most communities, needed mental health services are inadequately funded, and you may experience difficulty in matching existing resources with a patient's or family's needs.

Nurses who work in mental health centers must have strong communication and counseling skills and must be thoroughly familiar with community resources specific to the needs of patients being served in order to make appropriate referrals.

Remember **Paul Cochran**, the patient with a mental illness who ran out of his medications. The nurse needs knowledge of local mental health centers to ensure continuity of care, including follow-up with medication regimen.

Rural Health Centers

Rural health centers are often located in geographically remote areas that have few health care providers. Many rural health centers are run by APRNs who serve as the patient's primary health provider for the care of minor acute illnesses as well as chronic illnesses. Patients who are seriously ill or injured are given emergency care and then transported to the nearest large hospital. Nurses who practice independently may do so in collaboration with a health care provider. Many rural health care settings and providers now have immediate access to information about diagnosis and treatment of illness through telecommunication and computers. Health disparities facing Americans living in rural areas have recently been compounded by closures of rural hospitals. Two types of facilities have increased in recent years to meet the needs of rural patients:

- Critical access hospitals must have fewer than 25 acute inpatient beds, be located more than 35 miles from another hospital, provide around-the-clock emergency care services, and maintain an average length-of-stay of 96 hours or less for acute care patients.
- Freestanding emergency departments may be affiliated with a larger facility or operate independently.

The screening and education provided by nurses and nurse practitioners in rural communities continues to help patients live healthier lives (Peterson, 2020, p. 18).

Schools

School nurses are often the major source of health assessment, health education, and emergency care for the nation's children. The role of the school nurse reflects changes in society itself: children in schools today are from many different racial and ethnic groups, have varying socioeconomic backgrounds, and have more complex disabilities that require expert knowledge and skills for management during school hours. School nurses provide many different services, including maintaining immunization records, providing emergency care for physical and mental illnesses, administering prescribed medications, conducting routine health screenings (e.g., vision, hearing, scoliosis), and providing health information and education.

Industry

Many large industries have their own ambulatory care clinic, staffed primarily by nurses. Occupational health nurses in industrial clinics focus on preventing work-related injury and illness by conducting health assessments, teaching for health promotion (e.g., stopping smoking, eating sensibly, using safety equipment, exercising regularly), caring for minor accidents and illnesses, and making referrals for more serious health problems.

Homeless Shelters

Homeless shelters are usually living units, such as an apartment building or home, that provide housing for people who do not have regular shelter. People experiencing homelessness are at increased risk for illness or injury because of

factors such as exposure to the elements, exposure to violence, drug and alcohol use disorders, poor nutrition, poor hygiene, and overcrowding. Services provided by nurses in homeless shelters include immunizing children, teaching pregnant women, treating infections and illnesses, referring for diagnosis and treatment of STIs, and providing information about maintaining health. See the Vulnerable Populations Alert: Patients who are Homeless in Chapter 3.

Rehabilitation Centers

Rehabilitation centers specialize in services for patients requiring physical or emotional rehabilitation and for treatment of chemical dependency. These centers may be freestanding or associated with a hospital. The goal is to return patients to optimal health and to the community as independent members of society. Rehabilitation centers often use a multidisciplinary team composed of health care providers, nurses, PTs, occupational therapists, and counselors. The role of the nurse includes direct care, teaching, and counseling. The practice of rehabilitation nursing is based on a philosophy of encouraging independent self-care within the patient's capabilities.

Unfolding Patient Stories: Kim Johnson • Part 2

Recall **Kim Johnson** from Chapter 3, the 26-year-old police officer with paraplegia from a thoracic spinal cord injury. She is being transferred from the hospital to a rehabilitation facility. What education would the nurse provide on the purpose of a rehabilitation center? How can the nurse facilitate a smooth transition to the new facility for Kim and her parents? How may determinants of health play a role in her rehabilitation?

Care for Kim and other patients in a realistic virtual environment: *vSim for Nursing* (thepoint.lww.com/vSimFunds). Practice documenting these patients' care in DocuCare (thepoint.lww.com/DocuCareEHR).

Parish Nursing

Parish nursing is an expanding area of specialty nursing practice that emphasizes holistic health care, health promotion, and disease-prevention activities. It combines professional nursing practice with health ministry, emphasizing health and healing within a faith community. Parish nurses function as health educators, resource and referral aids, and facilitators of lay volunteer and support groups. Parish nurses reach out to those most vulnerable, such as older adults, those who have suffered a loss or change, single parents, and children. For more about parish nursing, see Chapter 47.

Health Care Services for the Seriously Ill and Dying

Health care services for the seriously ill and dying and for their families and caregivers include respite care, hospice, and palliative care. (End-of-life care is discussed further in Chapter 44.)

Respite Care

Respite care is a type of care provided for caregivers of homebound ill, disabled, or older adults. The main purpose is to give the primary caregiver some time away from the responsibilities of day-to-day care. Professionals or volunteers may provide care in an adult daycare center or in the patient's home. In most instances, the care is provided by qualified nursing assistants or volunteers. Professional nurses provide information about how to access respite care and may make referrals. Medicaid and most insurance providers do not cover the costs of respite care.

Hospice Services

Hospice is a program of palliative and supportive care services providing physical, psychological, social, and spiritual care for dying people, their families, and other loved ones. The interdisciplinary hospice team:

- Manages the patient's pain and symptoms
- Assists the patient with emotional, psychosocial, and spiritual aspects of dying
- Provides needed drugs, medical supplies, and equipment
- Instructs the family on how to care for the patient
- Delivers special services such as speech and physical therapy when needed
- Makes short-term inpatient care available when pain or symptoms become too difficult to treat at home, or the caregiver needs respite
- Provides bereavement care and counseling to surviving family and friends (National Hospice and Palliative Care Organization [NHPCO], 2020).

In 2017, an estimated 1.49 million Medicare beneficiaries received hospice services for 1 day or more (NHPCO, 2020). Approximately 44.6% of all deaths in the United States in 2011 were under the care of a hospice program. The

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

number of hospice programs nationwide has increased since the first program in 1974 to over 4,300 programs today. The Medicare hospice benefit, enacted by Congress in 1982, is the predominant source of payment for hospice care. To be eligible for hospice benefits from Medicare or Medicaid, the patient must have a serious, progressive illness with a life expectancy of 6 months or less.

Think back to **Margaret Ritchie**, who is caring for her husband at home. The health care provider recently informed her of her husband's prognosis. The nurse might anticipate that hospice care would be appropriate for Mrs. Ritchie and her husband.

The hospice nurse combines the skills of the home care nurse with the ability to provide daily emotional support to dying patients and their families. Hospice nurses are especially skilled in pain and symptom management. Their focus is on improving the quality of life rather than merely prolonging its length, and on preserving dignity for the patient in death. After the death, the nurse continues to care for the patient's family during the bereavement period for up to 1 year. Nurses use this time to help families work through the grief process after their loss. (See Chapter 44 for more information.)

Palliative Care

Palliative care evolved from the hospice experience but also exists outside of hospice programs. It is not restricted to the end of life and can be used from the point of initial diagnosis. Palliative care, which may be given in conjunction with medical treatment and in all types of health care settings, is patient- and family-centered care that optimizes the quality of life by anticipating, preventing, and treating suffering.

The NHPCO identifies the following features that characterize palliative care philosophy and delivery:

- Care is provided and services are coordinated by an interdisciplinary team.
- Patients, families, palliative and nonpalliative health care providers collaborate and communicate about care needs.
- Services are available concurrently with or independent of curative or life-prolonging care.
- Patient and family hopes for peace and dignity are supported throughout the course of illness, during the dying process, and after death (NHPCO, 2020).

HEALTH CARE FACILITIES

Many different types of facilities provide health care services. This section discusses voluntary facilities, religious facilities, and government facilities.

Voluntary Facilities

Community facilities are often nonprofit voluntary facilities. They are financed by private donations, grants, or fundraisers (although some may charge minimal fees). Examples of volunteer facilities are Meals on Wheels, which supplies meals to older and homebound people; transportation services for older and physically disabled people; and shopping or house-cleaning services. Other nonprofit voluntary community facilities include the American Heart Association and the American Lung Association. Health care providers and nurses are often active members of these organizations, providing health screenings and educational programs.

Voluntary facilities may also provide a setting for support groups. These groups provide an education and support system for patients who are adjusting to their health problems. Members of these support groups have experienced the same type of problem. By sharing their experiences, members learn to solve problems when dealing with a stressful or crisis situation. Professional nurses most often provide information about and make referrals to these facilities to patients and family members. The following are examples of support groups:

- *Alcoholics Anonymous*—an international organization for people recovering from alcohol use disorders. The purpose is to help people stop drinking and remain sober. Meetings are held in accessible community locations, such as churches and hospitals.
- *Cancer support groups*—focus on support and solving problems experienced by people diagnosed with cancer. Most cancer support group meetings are held at hospitals.

- *Reach to Recovery*—for women who have had a breast removed for cancer or have had breast reconstruction surgery. Among other activities, members visit women before surgery, teach exercises to prevent muscle atrophy, and provide information about prostheses and clothing.

Other Government Facilities

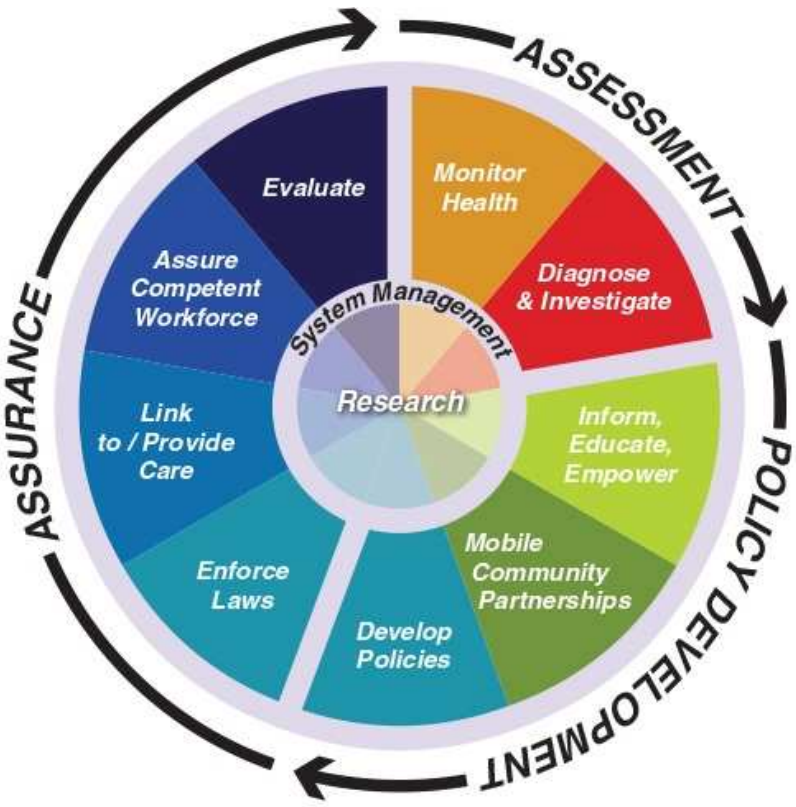
In addition to Medicare, Medicaid, and the Veteran's Association, described earlier, there are other government health facilities.

Public Health Service

The Public Health Service (PHS) is a federal health facility under the direction of the U.S. Department of Health and Human Services. The PHS is a multifaceted program with a wide range of services. It is the medical branch of the U.S. Coast Guard and the principal source of Native American health care through the Indian Health Services. The PHS supplies funds to health centers that provide care to migrant workers and to community facilities that supply health care to the poor and uninsured. The principal budget of the PHS goes to grant programs for poor and uninsured people.

The Centers for Disease Control and Prevention (CDC) in Atlanta and the National Institutes of Health (NIH) are both part of the PHS. The CDC focuses on the epidemiology, prevention, control, and treatment of communicable diseases, such as STIs. The NIH is engaged in both funding and conducting various health research activities.

The PHS also supplies health care professionals (e.g., nurses, health care providers, dentists, pharmacists) to the U.S. Department of Justice to provide care in federal prisons. The service is also involved in some state-administered drug and alcohol use and mental health programs. PHS activities focus on community needs whenever possible. Nurses practicing in these settings provide direct care, provide information, and serve as patient advocates within the community. See Figure 11-10 (on pages 294–295) for an illustration of 10 essential public health services and how they can address social determinants of health (SDOH) inequities.



Public Health Facilities

Public health facilities are local, state, and federal facilities that provide PHS at the local, county, state, or federal level. They are usually funded by taxes and run by elected or appointed administrators. Local facilities provide services and programs to promote health and prevent illness, such as providing immunizations and screening for tuberculosis and STIs. Public health facilities work with state and local departments to ensure public health through activities such as inspections of restaurants and water supplies. They also provide educational programs and may provide direct care services for low-income people or people living in rural, isolated areas. Nurses who practice in public health facilities focus on prenatal care, well-child care, screening programs, education, and outreach into the community (Fig. 11-11 on page 295).

COLLABORATIVE CARE: THE INTERPROFESSIONAL HEALTH CARE TEAM

In any type of facility, setting, or framework, nurses work with other members of the interprofessional health care team to plan, provide, and evaluate patient care (Box 11-3 on page 296). The likelihood of achieving valued patient outcomes is greatly enhanced when nurses are skilled in collaborating with other members of the professional caregiving team.

10 Essential Public Health Services

Five Key Areas of SDOH (HP 2020)

	Roles of Public Health Agency (Based on 10 Essential Public Health Services)	Examples of How Essential Public Health Services Can Address
1.	Monitor health status to identify and solve community health problems	Include SDOH measures as basis for addressing community health problems and inequities Ensure community health assessments (CHA) include SDOH measures and engage communities and multi-sectoral partners in CHA efforts
2.	Diagnose and investigate health problems and health hazards in the community	Include community-level determinants of health in investigations, as well as policies and practices that involve other sectors to support them. For example • Ensure water sources meet required standards • Ensure brownfield sites Identify hazardous waste that might contaminate a community • Address deteriorating housing conditions to prevent lead poisoning and other hazards to health
3.	Inform, educate, and empower people about health issues	Ensure outreach and education efforts address social and structural determinants of health inequities Ensure access to culturally and linguistically appropriate approaches to community health (e.g., REACH) to help address SDOH. Approaches should take into account such challenges as structural racism and stigma against immigrants, both of which can decrease likelihood of seeking needed health care.
4.	Mobilize community partnerships and action to identify and solve health problems	Engage and collaborate with community members and non-traditional partners associated with SDOHs, such as • Housing authorities • Law enforcement • Schools • Community organizations

5.	Develop policies and plans that support individual and community health efforts	Leverage evidence-based policies in non-health sectors that affect SDOH and health outcomes, such as • Safe and affordable housing that can reduce risk for asthma, lead poisoning, homelessness • Full-day kindergarten that can reduce adverse health prospects such as teenage pregnancy Develop and implement state/community health improvement plans that include and address the SDOH in collaboration with community partners
6.	Enforce laws and regulations that protect health and ensure safety	Develop strategies to ensure enforcement of existing regulations and laws that affect health, such as • Housing and health codes to prevent childhood lead poisoning. • Batterer intervention program laws to prevent violence against women and children
7.	Link people to needed personal health services and ensure the provision of health care when otherwise unavailable	Educate community members about their eligibility for and access to entitlement programs • Medicaid, including its medical, mental health, and housing benefits • TANF • SNAP Ensure that essential health benefits and the free preventive services provisions of the Affordable Care Act are correctly and equitably implemented
8.	Assure competent public and personal health care workforce	Support staff training and development efforts that help workforce incorporate social determinants of health inequity into their job responsibilities Promote hiring of workforce that reflects population being served
9.	Evaluate effectiveness, accessibility, and quality of personal and population-based health services	Ensure evaluation and research designs include interventions that address SDOH inequity Use performance management and quality improvement methods to explore and address more effectively the root causes of issues, which often include SDOH
10.	Research for new insights and innovative solutions to health problems	Expand research agendas to include SDOH and related health outcomes, especially in evaluation of natural experiments where a project is already addressing SDOH but is not studying health effects (e.g., implementation of the Essentials for Childhood Framework) Use community-based participatory research designs Apply evidence-based practices (e.g., *The Community Guide*) to address health inequity and demonstrate improved health outcomes

FIGURE 11-10. Ten essential public health services and how they can include addressing social determinants of health inequities. Public health departments and their partners need to consider how conditions in the places where people live, learn, work, and play affect a wide range of health risks and outcomes. These social determinants of health (SDOH), and actions to address the resulting health inequities, can be incorporated throughout all aspects of public health work. Through broader awareness of how the key public health practices can better incorporate consideration of SDOH, public health practitioners can transform and strengthen their capacity and impact to advance health equity. (*Source:* U.S. Department of Health and Human Services, Centers for Disease Control and Prevention. https://www.cdc.gov/publichealthgateway/publichealthservices/pdf/ten_essential_services_and_sdoh.pdf)

QSEN TEAMWORK AND COLLABORATION

In order to function effectively within nursing and interprofessional teams, fostering open communication, mutual respect, and shared decision making to achieve quality patient care, each nurse must demonstrate awareness of personal strengths and limitations as a team member and initiate plans for self-development.

In 2012, the U.S. Department of Health and Human Services awarded $4 million over 5 years to fund a new coordinating center to promote interprofessional education and collaborative practice in health care at the University of Minnesota Academic Health Center. The goal is to foster efforts to create a U.S. health care system that engages patients, families, and communities in collaborative, team-based care.

Box 11-3 **Collaborative Roles of Members of the Interprofessional Health Care Team**

Physician

The physician is primarily responsible for the diagnosis of illness and the medical or surgical treatment of that illness. Physicians are granted the authority to admit patients to a health care facility by the health care facility or institution itself and to practice care within that setting through such actions as prescribing medications, interpreting the results of laboratory and diagnostic tests, and performing procedures and surgery. A person becomes a physician after extensive education and clinical practice and a licensing examination. Physicians may choose to be general practitioners or to specialize in the treatment of one type of illness or body system (such as a cardiologist) or a specific type of surgery (such as an orthopedic surgeon).

Hospitalists are health care providers who provide care to patients when they visit the emergency department or are admitted to the hospital. They communicate with the patient's primary care health care provider but provide care while the patient is in the hospital. They also may take after-hour, weekend, and holiday calls and services for one or more health care providers.

Advanced Practice Registered Nurse

The Advanced Practice Registered Nurse (APRN) is a registered nurse educated at the master's or post-master's level in a specific role and for a specific population. Whether they are nurse practitioners, clinical nurse specialists, nurse anesthetists, or nurse midwives, APRNs play a pivotal role in the future of health care. APRNs are often primary care providers and are at the forefront of providing preventive care to the public.

Physician Assistant

A physician assistant (PA) has completed a specific course of study and a licensing examination in preparation for providing support to the physician. The PA's responsibilities usually depend on the supervising physician and might include conducting physical examinations and suturing lacerations. In most states, nurses are not legally bound to follow a PA's orders unless a physician cosigns the orders. This is an important aspect to investigate if PAs are employed by hospitals in your area.

Nurse

Nurses supervise and coordinate direct care to patients and families. They teach the patient and family self-care and conduct research to ensure cost effectiveness and quality of care. Nurses coordinate the services of other health care providers. See Chapter 1 for a description of the many roles nurses play and their different levels of education.

Physical Therapist

A physical therapist (PT) seeks to restore function or to prevent further disability in a patient after an injury

or illness. PTs use various techniques to treat patients, including massage, heat, cold, water, sonar waves, exercises, and electrical stimulation. Most PTs are also educated in the use of psychological strategies to motivate patients.

Occupational Therapist

Occupational therapists evaluate the patient's functional level and teaching activities to promote self-care in activities of daily living. They assess the home for safety and provide adaptive equipment as necessary.

Speech Therapist

A speech therapist is trained to help patients who are deaf or hard of hearing speak more clearly, to assist patients who have had a stroke to relearn how to speak, and to correct or modify a variety of speech disturbances in children and adults. Speech therapists also diagnose and treat swallowing problems in patients who have had a head injury or a stroke.

Social Worker

Social workers assist patients and families in dealing with the social, emotional, and environmental factors that affect their well-being. They make referrals to appropriate community resources and provide assistance with securing equipment and supplies, as well as with health care finances. In recent years, their role in discharge planning has been highlighted.

Pharmacist

A pharmacist, prepared at the doctoral level, is licensed to formulate and dispense medications. The pharmacist is also responsible for keeping a file of all patient medications and for informing the health care provider when a potential or actual medication error in prescribing has occurred or when prescribed drugs may interact adversely. The pharmacist is an excellent resource for information related to medications for both patients and nurses.

Respiratory Therapist

A respiratory therapist (RT) is trained in techniques that improve pulmonary function and oxygenation. RTs may also be responsible for administering a variety of tests that measure lung function and for educating the patient about the use of various devices and machines prescribed by the health care provider.

Dietitian

A registered dietitian (RD) manages and plans for the dietary needs of patients, based on knowledge about all aspects of nutrition. RDs can adapt specialized diets for the individual needs of patients, counsel and educate individual patients, and supervise the dietary services of an entire facility.

Chaplain/Spiritual Care Provider

Spiritual care providers identify and respond to the spiritual needs of patients, families, and other members of the interdisciplinary team. They may be members of the clergy, pastoral care workers with graduate degrees, or lay volunteers.

Assistive Personnel

Assistive personnel (AP) help nurses provide direct care to patients. As defined by individual state boards of nursing, AP may have the title of certified nursing assistants, orderlies, attendants, or technicians.

Take advantage of every opportunity to get to know the members of the interprofessional teams you will join as a student and learn what each member can contribute. Practice working collaboratively to make health care "work" for your patients and families. Read more about the care coordination role nurses play in Chapter 12.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Think about **Maritza Cortes**, the woman who brought her daughter to the emergency department. Her statement about not having the money needed to have the prescription filled would alert the nurse to the need for consulting social service. The social worker could provide Ms. Cortes with information about available financial assistance and community resources. Which members of the health care team are best equipped to meet the health care needs of Maritza and her daughter, Margaret Ritchie and her husband, and Paul Cochran? How would you collaborate with these members of the team?

TRENDS AND ISSUES IN HEALTH CARE DELIVERY

This section discusses some current issues and trends in health care. In your career as a nurse, you may find that as some issues are resolved, other new challenges arise. It is important for you both personally and professionally to be knowledgeable about all health care trends affecting the health care delivery system (Box 11-4).

Focus on Preventive Care

People's health awareness and desire to be involved in their own health care have strongly influenced the delivery of health care services in our society. Stress management programs, nutritional awareness, exercise and fitness programs, and antismoking and antidrug campaigns are all examples of this trend. These programs have never been more important in the United States as violence escalates and deaths from opioid misuse are increasing dramatically. Equally important to health are measures such as legislating the use of seat belts, promoting automobile and airplane safety, controlling smog, gun control, and eliminating hazardous wastes.

Box 11-4 Trends to Watch in Health Care Delivery

- Changing demographics
- Increasing diversity
- Technology explosion
- Globalization of economy and society
- Educated and engaged consumers
- Increasing complexity of patient care
- Costs of health care
- Effect of health policy and regulation
- Shortages of key health care professionals and educators

Knowledgeable and Engaged Consumers

A **consumer** is someone who uses a commodity or service. Health care consumers (patients or clients) are increasingly knowledgeable about health, prefer to control and make decisions about their own health, and want to be active participants in planning and implementing their health care. It is therefore critical for nurses to develop skills for creating successful partnerships with patients and their families. Consumers of health care services are better educated about the services they require and the services that are available, largely because so much health information is available on the internet. A downside is that many patients learn erroneous information from internet sites. It is critical for nurses to discover what patients know about their health challenges and to respectfully correct false or inappropriate information. Patients are also concerned about access to services, the cost of those services, and the quality of the care received. Consumers are questioning escalating costs and the proliferation and duplication of services. Consumers have become actively involved in the administration of health care facilities and have helped develop standards for care, patient rights, and cost-containment measures as protection for patients when they enter a health care setting.

The CMS now requires providers to meet several patient engagement benchmarks. More than 50% of the patients that clinicians see must now get timely access to their health information, including diagnostic test results, medication lists, and a clinical summary of their office visit, within one business day. While this is an important effort by the U.S. government to engage the public in self-care, respectful, trusting, and compassionate health care professional–patient relationships remain the most effective strategy to achieve these goals.

Mobile Health

The millennial generation enthusiastically embraced health apps, smartphones, and tablets, and savvy health care professionals and entrepreneurs are responding quickly to their demands. Patients can now access their medical records online, schedule appointments, and communicate with professional caregivers online. Tablets give access to electronic health record data, drug reference materials, and other valuable data that in the past was available only in the office or hospital. Patients, especially those with chronic illnesses, are similarly using apps and smartphone devices that let them measure weight, blood pressure, blood glucose, and more.

During the 2020 pandemic, there was an unprecedented increase in telehealth medical visits, which many expect to continue. Many nurses are filming teachable moments, such as how to dress a port, and then e-mailing the video to the patient or family caregiver. This trend will only increase and provide more opportunities for nurses to provide effective, quality care. Read more about informatics in Chapter 21.

Racial Justice and Equity

The year 2020 will forever be remembered in the United States not only because of the pandemic, but also because new instances of racial violence commanded the attention of the world and popularized the Black Lives Matter movement. In health care, there are now recurrent calls for all members of the interprofessional team to become antiracist, and we move toward zero tolerance for racism. We, of course, need to become newly aware of our personal beliefs and attitudes that reveal what might have been unconscious biases and predjudices. But we must also be ready to speak out as we encounter any institutional structures that perpetuate harmful and hurtful inequity and inequality. Remaining silent is no longer an option (Roberts, 2020). Read more about this in Chapter 3.

HEALTH CARE: A RIGHT, A PRIVILEGE, OR AN OBLIGATION OF A MORAL SOCIETY?

Two major factors influencing the provision of health care in the United States are the ability to pay for care and the location of facilities. Poor or uninsured people, minorities, residents of rural areas, and older adults often have inadequate access to health care services. In the United States, there are still too many who have inadequate health insurance or none at all. As this book goes to press, we are still waiting to see the effects a new political administration will have on health reform.

Although many people assume that everyone has a right to health care, consider these questions that pose ethical dilemmas for nurses who provide care, as well as for consumers of health care services:

- Do people who engage in risky behaviors or who do not make necessary lifestyle changes deserve the same health care as people who live healthy lives?
- Who should pay for health care needed by the unemployed and homeless?
- Is someone who pays for national television coverage to ask for an organ donation for his child any more deserving than someone who has been waiting months for just such a transplant?
- Should citizens pay higher insurance premiums or taxes so that someone addicted to drugs who overdoses can have intensive care?
- Should undocumented workers in the United States have the same access to health care as U.S. citizens?
- What priorities should we use when deciding how to distribute COVID-19 vaccines: ability to pay, age, prisoners, nursing home residents and those who work there, health care workers, other essential workers, etc.?
- Should vaccination status be used as a criterion for allocating critical care beds, ventilators, or other therapies that are in short supply?
- If 20 people need a heart transplant and only one heart is available, who decides who gets another chance at life and how should these decisions be made?

These are only a few of the questions being raised, and there are no easy answers. Carefully review the *Code of Ethics for Nurses* (Chapter 6) and the American Nurses Association website resources on health care reform to guide your responses.

NURSES' ROLE IN HEALTH CARE REFORM

Since the delivery of health care continues to change rapidly, it is fitting to conclude with a note about nurses' continuing role in health care reform. Changes taking place in health care give nurses the opportunity to help shape health care for the future. Projections about competencies of future health care practitioners, coupled with the national health promotion and disease prevention objectives outlined in the *Healthy People 2030* project (www.healthypeople.gov), underscore the importance of nursing's role in improving access to care, quality of care, and cost of care.

The U.S. health care system is facing many challenges, including rapidly increasing numbers of older adults, changing expectations of health care consumers, rapidly expanding technologies, increasing disparities, and an emphasis on improved quality and safety of care. The goals of health care reform focus on cost containment, improved access, and increased quality of services for all citizens. Where do nurses fit into the reform movement? First, nurses are becoming a stronger voice in protesting health-related problems in our nation and proposing solutions. Second, nurses in greater numbers are increasing their education and becoming APRNs and Doctors of Nursing Practice (DNPs) or PhDs. As such, more nurses now provide primary health care services in areas and to people long neglected: older adults, women, infants, people living in poverty, and those living in rural areas.

Nurses are seated at the tables where decisions are being made about how best to design, deliver, finance, and evaluate health care. In addition, the focus of nursing care provided by all nurses is holistic care essential to promoting health and preventing illness. The issues of who gets health care and who pays the bills continue to have major

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

importance for society in the 21st century. These issues will present both challenges and opportunities for nurses of the future.

DEVELOPING CLINICAL REASONING AND CLINICAL JUDGMENT

. How might prenatal and well-child care differ for two women: one without health insurance and the other with a good health insurance plan? Why do you think this happens? What can nurses do to ensure respectful, compassionate care of high quality for all?
. Talk with your classmates about what should be in an essential health services package available for all. Would you include dental care, mental health services, complementary and alternative treatment modalities, women's health services including birth control and abortion, long-term care? Why is it so difficult for health planners to agree on what services are essential?
. Think back to Paul Cochran, Margaret Ritchie and her husband, and Maritza and her children. What biases might professional caregivers hold even unconsciously that could interfere with their providing optimal care? Reflect on any personal biases that might impair your ability to make health care "work" for all, especially the most vulnerable.
. Interview as many people as you can about what the government's role should be in providing health care. Why in the United States are so many distrustful of "big" government playing an expanded role in health care?

PRACTICING FOR NCLEX

. Nursing students are reviewing information about health care delivery systems in post conference. Which statements describing current U.S. health care delivery practices should be included in the discussion? Select all that apply.

a. Access to care depends only on the ability to pay, not the availability of services.
b. The Patient Protection and Affordable Care Act provides private health care insurance to underserved populations.
c. Every health insurance plan in the Health Insurance Marketplace offers comprehensive coverage, from doctors to medications to hospital visits.
d. The uninsured pay for more than one third of their care out of pocket and are usually charged lower amounts for their care than the insured pay.
e. Fifty years ago, half of the doctors in the United States practiced primary care, but today fewer than one in three do.
f. Quality of care can be defined as the right care for the right person at the right time.

. Nurses provide care to patients in secondary health care facilities. Which patients do the nurses anticipate will receive this type of care? Select all that apply.

a. Patient seeking treatment at a community clinic for possible strep throat
b. Patient treated in the hospital following a myocardial infarction
c. Child brought to the emergency department following a seizure
d. Individual with osteogenesis imperfecta being treated in a medical center
e. Child visiting a specialist to correct a congenital heart defect
f. Patient who has a hernia repair in an ambulatory care center

. A nurse working in a primary care facility prepares insurance forms in which the provider is given a fixed monetary amount per enrollee in the health plan. What term do the nurses apply to this type of reimbursement?

a. Capitation
b. Prospective payment system
c. Bundled payment
d. Rate setting

. A nurse working in a pediatric clinic provides codes for a patient's services to a third-party payer who pays all or most of the care. How does the nurse refer to this method of payment?

a. Out-of-pocket payment
b. Individual private insurance
c. Employer-based group private insurance
d. Government financing

. A nurse researcher follows current trends in health care delivery. Which present-day trends does the nurse observe? Select all that apply.

a. Globalization of the economy and society
b. Slowdown in technology development
c. Decreasing diversity
d. Increasing complexity of patient care
e. Changing demographics

f. Shortages of key health care professionals and educators

. A nursing student is assisting with nursing care for patients in a primary care center. Based on the setting, what activities will the student expect to perform?

a. Assisting with major surgery
b. Performing health assessments
c. Maintaining patients' function and independence
d. Maintaining immunization records

. The caregiver for a patient who is immobile and requires tube feedings asks the nurse to explain respite care. How does the nurse best explain this type of care?

a. "It's a type of service that allows time away for caregivers."
b. "It provides comfort and end-of-life services for the terminally ill and their families."
c. "It is skilled care provided to older adults in a long-term care facility."
d. "It provides living units available to people without regular shelter."

. A nurse caring for patients in a primary care setting submits paperwork for reimbursement from managed care plans for services provided. What best describes managed care?

a. System designed to control cost of care while maintaining quality
b. Care coordination to maximize positive outcomes to contain costs
c. Delivery of services from initial contact through ongoing care
d. Based on a philosophy of ensuring death in comfort and dignity

. As part of a clinical paper, a nursing student interviews a hospice nurse about their role. How will the student describe the type of care the nurse provides?

a. Physical, psychological, social, and spiritual care for dying patients, their families, and loved ones
b. Preventive, primary care, focusing on diabetes education, immunizations, and prenatal care
c. Care focusing on rare diseases and specialty care
d. Care to meet the patient's health care needs while giving a break to the patient's caregiver

. Nursing students learn advance practice nurses can write medication prescriptions. Which roles may be performed by an advanced practice registered nurse? Select all that apply.

a. Primary care provider
b. Hospitalist
c. Physical therapist
d. Anesthetist
e. Midwife
f. Pharmacist

. The nurses at a large community hospital with several campuses are members of a committee working toward obtaining Magnet status. What activity will best meet their goal?

a. Recruiting excellent surgeons and medical doctors
b. Offering health prevention activities in the community
c. Providing high-quality patient care, using innovative practices
d. Seeking culturally diverse clergy to meet patient's spiritual concerns

. During a meeting with nurses at all levels in an acute care hospital, the Director of Nursing discusses lost revenue due to Medicare penalties. The nurses plan improvements in practice designed to prevent penalties from which events? Select all that apply.

a. Urinary catheter–related infections
b. Blood infections from central venous catheters
c. Excessive readmissions
d. Pressure injuries
e. High blood pressure

. Nursing students are asked to provide interprofessional care during their clinical experience. Which member of the health care team will the student contact for an uninsured patient?

a. Nurse practitioner
b. Admissions coordinator
c. Social worker
d. Hospital chaplain

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

ANSWERS WITH RATIONALES

. **c, e, f.** The Health Insurance Marketplace is designed to help people more easily find health insurance that fits their budget. All plans in the Marketplace offers comprehensive coverage, from doctors to medications to hospital visits. There are many less primary care providers in the United States than there were 50 years ago. Quality is the right care for the right person at the right time. Access to care depends on both the ability to pay and the availability of services. The Patient Protection and Affordable Care Act provides Medicaid or subsidized coverage to qualifying people with incomes up to 400% of poverty. The uninsured pay for more than one third of their care out of pocket and are often charged higher amounts for their care than the insured pay.

. **b, c, f.** Secondary health care treats problems that require specialized clinical expertise, such as an MI, a seizure, and a hernia repair. Treating strep throat is primary health care. Tertiary health care involves management of rare and complex disorders, such as osteogenesis imperfecta and congenital heart malformations.

. **a.** Capitation plans give providers a fixed amount per enrollee in the health plan to build a payment plan that consists of the best standards of care at the lowest cost. The prospective payment system groups inpatient hospital services for Medicare patients into DRGs. With bundled payments, providers receive a fixed sum of money to provide a range of services. Rate setting means that the government could set targets or caps for spending on health care services.

. **b.** The four basic modes of paying for health care are out-of-pocket payment, individual private insurance, employer-based group private insurance, and government financing. The *International Classification of Diseases, 10th Edition* and procedure codes, or ICD-10, includes codes for new procedures and diagnoses that improve the quality of information available for quality improvement and payment purposes. With individual private insurance, members pay monthly premiums either by themselves or in combination with employer payments. These plans are called third-party payers because the insurance company pays all or most of the cost of care. Out-of-pocket payment is paying for health care with cash payments. Employer-based private insurance is employer-sponsored coverage and government financing is provided through Medicare and Medicaid, and other federally funded programs.

. **a, d, e, f.** Trends to watch in health care delivery include globalization of the economy and society, increasing complexity of patient care, changing demographics, shortages of key health care professionals and educators, technology explosion, and increasing diversity.

. **b.** Performing health assessments is a common role of the nurse in a primary care center. Assisting with major surgery is a role of the nurse in the hospital setting. Maintaining patients' function and independence is a role of the nurse in a rehabilitation or extended-care facility, and keeping student immunization records up to date is a role of the school nurse.

. **a.** Respite care is provided to enable a primary caregiver time away from the day-to-day responsibilities of homebound patients.

. **a.** Managed care is a way of providing care designed to control costs while maintaining the quality of care.

. **a.** The hospice nurse combines the skills of the home care nurse with the ability to provide daily emotional support to dying patients and their families. Respite care caregivers of homebound ill, disabled, or older adults. Palliative care, which can be used in conjunction with medical treatment and in all types of health care settings, is focused on the relief of physical, mental, and spiritual distress. Extended-care facilities include transitional subacute care, assisted-living facilities, intermediate and long-term care, homes for medically fragile children, retirement centers, and residential institutions for mentally and developmentally or physically disabled patients of all ages.

. **a, d, e.** The Advanced Practice Registered Nurse (APRN) is a registered nurse educated at the master's or post-master's level in a specific role and for a specific population. Whether they are nurse practitioners, clinical nurse specialists, nurse anesthetists, or nurse midwives, APRNs play a pivotal role in the future of health care. APRNs are often primary care providers and are at the forefront of providing preventive care to the public. Hospitalists are health care providers who provide care to patients when they visit the emergency department or are admitted to the hospital. A physical therapist completes a specific training program to learn to help patients restore function or to prevent further disability in a patient after an injury or illness. A pharmacist, prepared at the doctoral level, is licensed to formulate and dispense medications.

. **c.** Magnet hospitals meet strict requirements and standards representing the highest quality of professional nursing practice and patient care, nursing excellence, and innovations in practice. Physicians are recruited by the medical department, health prevention activities in the community could be conducted by nursing staff but are not required activities; chaplains, nurses, and others may provide spiritual care, but it is not the focus of a Magnet designation.

. **a, b, c, d.** Medicare penalties are given to hospitals when patients are readmitted soon after discharge; this is designed to ensure patients receive needed coordinated care after discharge. In addition, Medicare no longer reimburses hospitals for conditions that result from preventable errors and lead to increased costs. These include pressure injuries, injuries caused by falls, infections associated with indwelling urinary catheters, vascular catheter–associated infections, infections of the mediastinum after coronary artery bypass graft, air embolisms, adverse reactions to incompatible blood infusions, and retained sponges or instruments during surgery.

. **c.** Social workers assist patients and families in dealing with the social, emotional, and environmental factors that

affect their well-being. They make referrals to appropriate community resources, participate in discharge planning to obtain equipment and supplies, and assist with health care finances. Nurse practitioners assist in managing the medical and nursing needs of a patient, the admissions coordinator performs administrative intakes and may assign beds, and the hospital chaplain attends to patients' spiritual needs.

Interprofessional Collaborative Practice and Care Coordination Across Settings

Jeff Hart

Jeff is a 9-year-old boy with a genetic disease that includes severe intellectual disability. He is transferred from the state home for children to the hospital for respiratory complications.

Laura Degas

Laura, a 78-year-old woman, has been caring for her sister Ellen at home. She says, “She was diagnosed with Alzheimer’s disease 2 years ago. This surgery to fix her broken hip has really been tough. I want to take her home, but I’m not sure if I can give her the care that she needs now.”

Joey Marshall

Joey, an extremely low–birth-weight baby (1,100 g), spent 7 months in the hospital before being discharged home. His mother is caring for him, his twin (who is healthier), and their 3-year-old sister. Joey is still being fed artificially, is on a ventilator, and needs care around the clock.

Learning Outcomes

After completing the chapter, you will be able to accomplish the following:

. Identify key elements of community health.
. Describe the qualities and roles of the community-based nurse.
. Describe the role of the nurse in ensuring continuity of care and coordinating care between and among health care settings and the home.
. Describe collaborative practice.
. Discuss the importance of care coordination, including admissions, transfers, and discharges.
. Discuss considerations for establishing an effective nurse–patient relationship when admitting a patient to a health care setting.
. Compare and contrast admission of a patient to an ambulatory care setting and a hospital setting.
. Discuss transfer of patients within and among health care settings.
. Explain how nurses use the components of discharge planning to provide continuity of care.
. Describe the components of the home health care system, including facilities, patients, referrals, primary caregivers, reimbursement sources, and legal considerations.
. Explain the essential components of the pre-entry and entry phases of the home visit.
. Explain the importance of documentation in home care.

patient handoffs
situation–background–assessment–recommendation (SBAR)
telehealth

People enter health care settings and become consumers of health care services (patients) for many different reasons. Not all people have the same types of health care needs, nor are they alike as patients. Some are admitted to a treatment setting and discharged the same day, some remain in an acute care setting for months, and some require extended care at home or in another community setting. Increasingly, people are seeking health care services in the communities where they live, study, work, pray, and play.

Entering and leaving a health care setting, as well as receiving care at home, are experiences that produce anxiety for

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

both patients and family members. The nurse is often the health care provider who helps the patient and family make a smooth transition from one care setting to another. (See the accompanying Reflective Practice display for an example.) Planning for and providing individualized nursing interventions that promote health and wellness, prevent illness, and support coping with disability are critical in today's culturally diverse society. It is no longer enough only to consider the patient's needs within the hospital setting; nurses must also consider how those needs will be met as the patient makes the transition from the acute care setting to some type of long-term care or to care at home with support and services from the patient's community.

Five concepts essential to nursing care of patients within and across health care settings, discussed in this chapter, are community health, community-based nursing care, continuity of care, collaborative practice, and care coordination.

Consider **Laura Degas**, whose sister Ellen has Alzheimer disease. Because of her sister's increased complexity of care after undergoing a hip repair, Ms. Degas is unsure if she can continue to care for Ellen at home. The nurse would work with Ms. Degas to determine her needs and possibly enlist the aid of social services for assistance with a referral to home care and appropriate resources and community services.

COMMUNITY HEALTH

It's important for every nurse to recognize that healthy communities are not just about physical health. The Robert Wood Johnson Foundation writes:

> Where we live shouldn't determine how long or how well we live. In our communities we should all be surrounded by conditions that enable us to live the healthiest life possible, such as access to healthy food, quality schools, stable housing, good jobs with fair pay, and safe places to exercise and play. Unfortunately, in many communities, there are persistent barriers to health and opportunity to thrive (https://www.rwjf.org/en/our-focus-areas/focus-areas/healthy-communities.html).

See the accompanying Through the Eyes of a Pediatrician box on page 306.

The Centers for Disease Control and Prevention (CDC) defines a community as typically defined by a geographic area but notes that they can also be based on shared interests or characteristics such as religion, race, age, or occupation. People within a community come from different backgrounds and have unique cultures, customs, and values. The CDC report on community needs assessment writes that utilizing this wide range of ideas and wisdom is critical to assessing the community needs and strategizing areas for improvement (2013).

Healthy People 2030 defines Leading Health Indicators (LHIs) as a small subset of high-priority *Healthy People 2030* objectives selected to drive action toward improving health and well-being. Most LHIs address important factors that impact major causes of death and disease in the United States, and they help organizations, communities, and states across the nation focus their resources and efforts to improve the health and well-being of all people. *Healthy People 2030* includes 23 LHIs. To learn how LHIs are connected to other Healthy People objectives and the *Healthy People 2030* vision, check out the graphic in Figure 12-1 (on page 306). You can also visualize the graphic and tap on select boxes to review the overall health and well-being measures, LHIs, and developmental and research objectives at: https://health.gov/healthypeople/objectives-and-data/about-objectives/healthy-people-2030-objectives-and-measures.

QSEN Reflective Practice: Cultivating QSEN Competencies

CHALLENGE TO TECHNICAL SKILLS

Joey Marshall, an extremely low–birth-weight baby (1,100 g), spent 7 months in the hospital before being discharged home. His mother is now at home full time caring for him, his twin (who is healthier), and their 3-year-old sister. Joey is still being fed via tube feedings, is on a ventilator, and needs care around the clock. When I first visited Joey on the day he was discharged home, I was frightened at the sight of such a small baby surrounded by beeping machines and tubes. While this was not a new sight for Joey's mom,

she seemed very uncomfortable being his primary caregiver. She said she had lots of practice taking care of him in the hospital, but nothing had prepared her for the reality of his coming home and needing help around the clock.

Thinking Outside the Box: Possible Courses of Action

- Take a “pass” on this family and tell my instructor that this family’s needs exceed my capacity to care; an adult with a lot of tubes is one thing, but a BABY!
- Ask for an experienced mentor to guide me through a comprehensive family assessment and plan to meet everyone’s needs; use this as a challenge but ask for help until I feel competent and confident.
- Act like I know what I’m doing and pray I don’t make mistakes!

Evaluating a Good Outcome: How Do I Define Success?

- Joey’s mother develops the competence and confidence she needs to provide Joey’s care at home.
- I am honest about my ability and seek help when I need it.
- I learn something from each situation that will prepare me to meet the next clinical challenge.
- I don’t let my fear interfere with my learning.

Personal Learning: Here’s to the Future!

I decided that options #1 (taking a pass) and #3 (acting like I knew what I was doing) weren’t really options, although they seemed tempting. An experienced home health care nurse who once worked in the neonatal intensive care unit (NICU) agreed to visit this family with me, and she talked me through a comprehensive assessment. I was able to use my fear to identify with how Joey’s mom was feeling, and I believe I was able to make her feel comfortable. I told her that we would learn how to do everything together! By the end of this rotation, we were both comfortable with Joey’s care. I learned a valuable lesson: to seek help when I am in over my head and to relish a challenge. I hope I will remember this experience as I grow more confident so that I never forget how overwhelmed many families feel when they first bring a loved one home!

QSEN SELF-REFLECTION ON QUALITY AND SAFETY COMPETENCIES DEVELOPING KNOWLEDGE, SKILLS, AND ATTITUDES FOR CONTINUOUS IMPROVEMENT

How do you think you would respond in a similar situation? Why? What does this tell you about yourself and about the adequacy of your skills for professional practice? Can you think of other ways to respond? What other knowledge, attitudes, and skills do you need to develop to continuously improve the quality and safety of care for patients like Joey?

Patient-Centered Care: What made creating a partnership with Ms. Marshall so challenging? What abilities did the experienced home health care nurse and student use to achieve a good outcome? What special talents do you bring to creating successful partnerships?

Teamwork and Collaboration/Quality Improvement: What communication skills do you need to improve to ensure that you function as a competent, caring, and responsible member of the patient care team and that you obtain appropriate assistance when needed? How is collaborative practice and teamwork different for home health care nurses? What special talents do you bring to promoting a well-functioning team? How did the student’s commitment to quality care influence her response?

Safety/Evidence-Based Practice: What priority did the student give to Joey’s health, well-being, and safety? What does research demonstrate about the safety of providing care in the home that once happened in the hospital? Did the nursing student seek out the most appropriate resources for help in responding to Joey and his mother’s complex needs? What other resources could have been helpful? Do you agree with the criteria to evaluate a successful outcome? Did the nursing student meet the criteria? Explain your answer.

The IRS requires not-for-profit hospitals to conduct community health needs assessments to demonstrate how they are meeting these needs. For an excellent example of how this works you may want to see the San Diego 2019 Community Health Needs Assessment (https://hasdic.org/wp-content/uploads/2019-CHNA-Executive-Summary.pdf). Figures 12-2 through 12-4 illustrate their process map, engagement participants, and findings: Top 10 community health needs. You will find many examples of community health needs assessments in the literature. The Johns Hopkins Hospital & Johns Hopkins Bayview Medical Center 2018 Community Health Needs Assessment identified the following

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

socioeconomic and direct health care needs in decreasing order of priority:

Through the Eyes of a Pediatrician

A baby born in Flint, where I am a pediatrician, is likely to live almost 20 fewer years than a child born elsewhere in the same county. She's a baby like any other, with wide eyes, a growing brain and a vast, bottomless innocence—too innocent to understand the injustices that without her knowing or choosing have put her at risk.

Throughout the United States, geography defines and describes inequities in health, wealth, mobility, and longevity. The reasons for this are both visible and hidden. Life in a distressed neighborhood means limited access to health care and healthy food. It means living with violence, racism, poverty, and uncertainty. It means bearing the brunt of environmental injustice—not having safe and affordable water, as Flint knows too well, or living in the shadow of a polluting factory. More air pollution increases the rate of respiratory disease and reduces student achievement. We are also beginning to understand the interplay of water access and air quality with COVID-19 severity.

Science tells us that children exposed to multiple adversities, both in their home and neighborhood, have a far greater likelihood of challenges later in life. From addiction to eviction, those pressures change children on a molecular, cellular, and behavioral level—and make them sick. The effects of toxic stress can be as disruptive as environmental pollution on their bodies, increasing risk for chronic diseases like asthma and hypertension, and lowering life expectancy. [Read more about adverse childhood events (ACEs) in Chapter 43.]

Are you aware of community health needs assessments being done in your area? Are you prepared to answer these questions?

- What are the three most important health issues in your community?
- What are the three most important unhealthy behaviors in your community?
- What are the three most important factors that impact your well-being in your community?

Also check out Figure 12-5, which illustrates the national dialogue to build awareness of mental health issues in communities.

COMMUNITY-BASED NURSING CARE

Community-based care is health care provided to people who live within a defined geographic area. That geographic area might be a small neighborhood within a large urban area or a large area of rural residents. Each community is unique and is defined by the people, area, social interactions, and common ties within that community. In contrast to community health and public health nursing (which are population based and focus on the health of the whole community by targeting community interventions like immunizations, infection prevention, environmental health, and opioid crisis response), community-based care centers on individual and family health care needs. It emphasizes the provision of comprehensive, coordinated, and continuous services for patients with acute or chronic health problems. Within a framework of community-based care, nurses help people wherever they are, including where they live, work, play, worship, and go to school. Community-based practice sites can be as varied as neighborhood clinics, patients'

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

homes, long-term care facilities, schools, churches, and prisons. Almost 30% of RNs work in such nonacute patient care settings, and this number is growing. When health care is provided in the community, the nurse must adapt to the patient's environment and blend clinical skills with flexibility (Fig. 12-6).

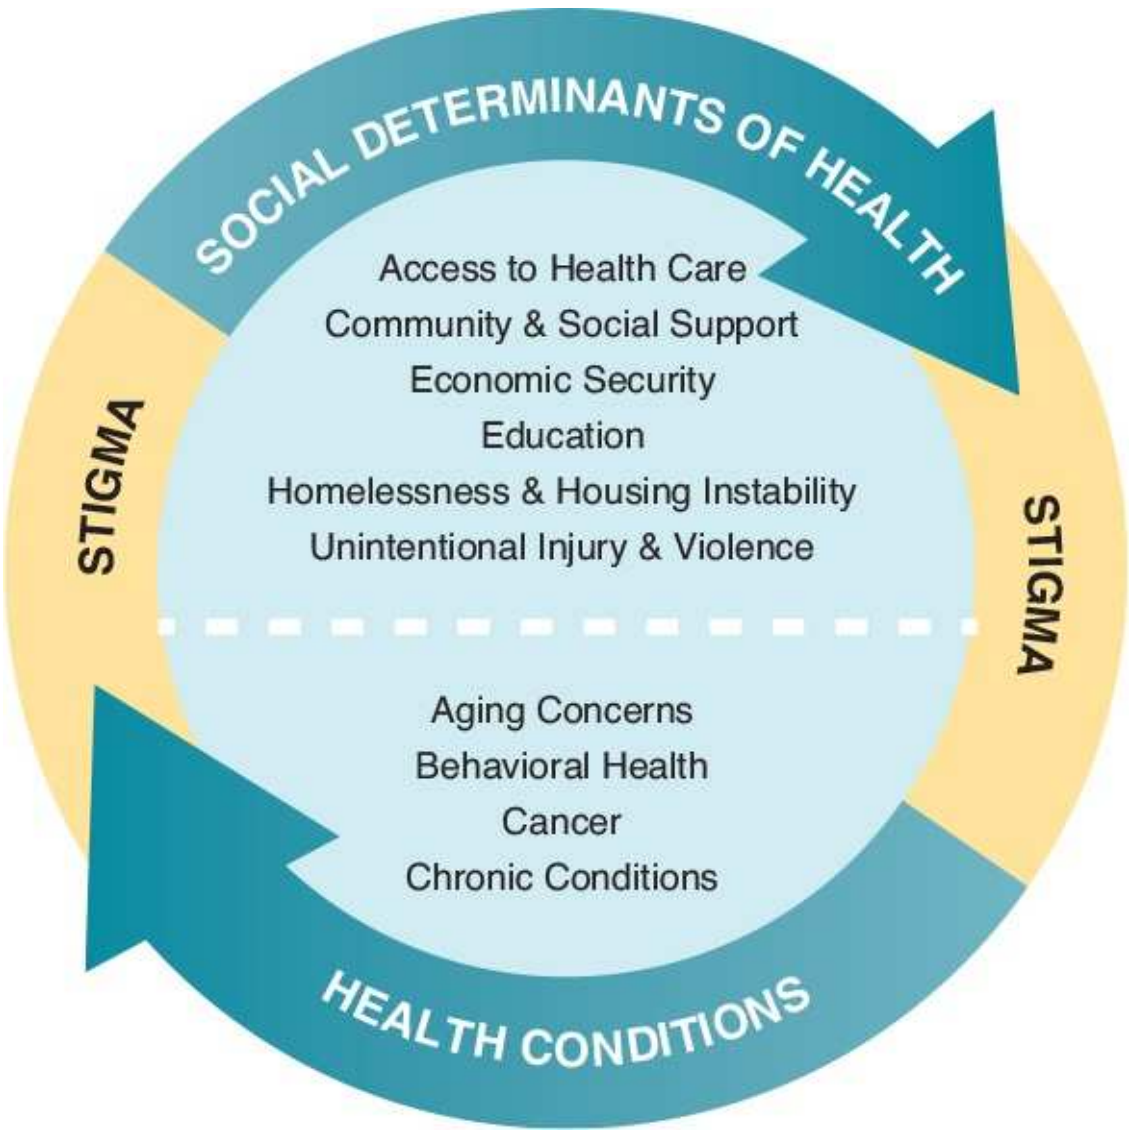

FIGURE 12-4. Community Health Needs Assessment (CHNA) Top 10 Community Health Needs. This figure illustrates the interactive nature of social determinants of health (SDOH) and health conditions, each impacting the other period in addition, an underlying theme of stigma and the barriers it creates arose across community engagement. For instance, stigma impacts the way in which people access needed services that address SDOH, which consequently impacts their ability to maintain and manage health conditions. Due to the complexity of this underlying theme, the CHNA Committee plans to explore and understand ways in which hospitals and health systems could better address stigma in patient care during phase two of the CHNA process. Concept Mastery Alert

Community-based care and community health care are different. A helpful way to remember the difference is to think that community is larger than community based. So, community health care focuses on populations, whereas community-based care focuses on individuals and families.

Nurses practicing community-based care consider the continuity of the care patients require when moving from one level or setting of care to another; they provide interventions to promote health, manage acute or chronic illnesses, and promote self-care. Community-based care is designed to meet the needs of people as they move into, between, and among different health care settings within the overall health care system.

Until about 1990, community-based nurses were considered generalists, but recently many have gained advanced skills to meet the growing demands of acutely ill patients being cared for at home and in other community settings. These specialties include enterostomal therapy, cardiac care, mental health, maternal and child health, and palliative care. Specialized nursing knowledge and skills coupled with sophisticated technology increasingly allow many patients with acute and chronic health care needs to be treated safely and effectively in the home.

Qualities of the Community-Based Nurse

Nurses choose to practice community-based nursing in both urban and rural settings for various reasons. Many nurses enjoy practicing in an autonomous setting where they can use their expertise in an expanded role. Others enjoy managing their time independently and like the satisfaction experienced when patients welcome them into their home and life. Community-based nurses find satisfaction in networking with community facilities to provide individualized care. Community settings also provide an opportunity for nurses to be creative in delivering care. Community-based nurses must possess several key qualities: they must be knowledgeable and skilled in their practice, able to make decisions independently, and willing to remain accountable. While these qualities hold true for all nurses, the fact that many nurses in the community work independently makes these qualities even more critical for community-based nurses. For example, if a home hospice nurse fails to appropriately assess a patient and report a developing complication to the team, the patient may never receive the needed proactive care.

Knowledgeable and Skilled

Nurses who provide care in the community must have the knowledge and skills needed to provide appropriate care. Both effective communication and clinical skills are essential (Fig. 12-7). In fact, many community-based facilities require a minimum of 1 year of clinical practice as a prerequisite for employment. Physical assessment skills are necessary to identify positive and negative changes in a patient's health status. Procedures such as administering intravenous fluids, changing complex wound dressings, caring for ostomies, and providing ventilator care are often required. Home health care nurses have identified the following areas of knowledge as most important in home care: physical assessment, body mechanics, diagnosing/problem identification, infection control, and legal regulations.

Independent in Making Decisions

Nurses providing care in the community make independent decisions and assume responsibility for decision making. They are generally away from other health care providers when providing care and must be able to make patient care decisions independently. The combination of a sound theoretical foundation, proficiency in clinical skills, and ability to

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

solve problems creatively enables the nurse to make appropriate patient care decisions.

FIGURE 12-7. Home health care nurses combine effective communication skills with a sound clinical knowledge base when caring for patients and their families. (*Source:* Used with permission from Shutterstock. *Photo by Monkey Business Images*.)

Accountable

Accountability is another important characteristic of community-based nurses. In a hospital, the nurse generally works a shift and then reports to the next shift nurse, who continues to care for the patient. Nurses seeing patients in their homes generally are not followed by a next shift but instead rely on family or other caregivers to continue the care. If there is no caregiver in the home, the nurse returns to face the same issues at the next visit. The nurse is accountable to the patient, the family, and the primary health care provider. Community-based nurses must consider questions such as the following:

- Whom do I call if the patient's physician or nurse practitioner is not available?
- What should I do if a family member becomes acutely ill?
- How do I learn to perform advanced procedures?
- How do I document the patient's decisions about treatment?
- How do I work collaboratively and ensure that other providers know about and document the care plan?

Roles of the Community-Based Nurse

In addition to having excellent caregiving skills, the community nurse is a patient advocate, coordinator of services, and patient and family educator/counselor.

Patient Advocate

Advocacy—the protection and support of another's rights—is an important role of community nurses. Patients often need help understanding the complex health care system, handling insurance problems, or dealing with state and federal regulations affecting their care and their environment. For example, the nurse may have to convince the patient's insurance carrier of the need for continued home health services. Patients may need help understanding complex billing issues related to their care. Home health care nurses can often mobilize services needed to improve the patient's environment.

QSEN THOUGHTFUL, PATIENT-CENTERED PRACTICE

Emotional support and alleviation of fear and anxiety along with involvement of family and friends are two principles of thoughtful patient-centered practice. When hospitals and nursing homes prevented families from visiting loved ones with COVID-19, including those who were in critical care units and dying, nurses turned to technology to support these patients and residents. Suddenly nurses were becoming skilled in using electronic tablets and smartphones to facilitate communication with families. Nurses became a welcome bridge for loved ones desperate to see a family member, often in the last minutes before death. And ultimately, nurses themselves became the last human to touch a patient or resident before death.

Community nurses who are committed to advocating for vulnerable patients and families work long hours and face many challenges. It is sometimes difficult to establish and maintain professional boundaries and to sever ties when appropriate with families the nurse has come to know and love. It is helpful to be aware of these challenges and to be able to discuss them with respected team leaders and colleagues. Read more about advocacy in Chapter 6.

Coordinator of Services

The community-based nurse generally coordinates all other health care providers visiting the patient and is the primary source of communication and coordination of the patient's care with the primary health care provider. The nurse uses effective communication skills with other health care providers while coordinating services for the patient.

A community-based nurse is also responsible for coordinating community resources needed by the patient. A sound knowledge of community resources enables the nurse to provide comprehensive services to the patient. For example, the nurse must understand the role of a social worker or physical therapist to determine a need for these services. The nurse should know about available community resources, such as Meals on Wheels, the American Cancer Society's services, services for patients who are visually impaired or deaf/hard of hearing, and local services for the aging. As the coordinator of care, the nurse directs the various services toward a common goal of improving the patient's health and promoting independence. How will you learn which community resources are available for Jeff Hart, Laura Degas, and Joey Marshall's families (described at the beginning of the chapter) and for all the patients for whom you will provide care?

Patient and Family Educator/Counselor

Nurses providing community-based care in a clinic or home teach patients and families about all aspects of care, including disease processes and treatments, nutrition, medications, and treatment and care of wounds. The nurse identifies learning needs; then the nurse, patient, and family mutually develop goals for teaching information necessary to promote health. Family members or other caregivers may be taught any skill that they are able and willing to perform.

The nurse provides the information necessary to keep the patient safe until the next visit, using methods that work best in the home or other community setting. The goal is to increase the patient's ability to provide self-care and the caregiver's ability to care for the patient. The teaching and learning process is fully described in Chapter 9 as well as the counseling responsibilities of the nurse.

Remember **Joey Marshall**, the high-risk infant coming home after 7 months in the NICU. In this situation, the home health care nurse fills many roles; one of the major roles will be that of educator, with the goal of teaching Joey's mother so that she can ultimately care for Joey independently.

CONTINUITY OF CARE

Over their lifetimes, most people require many different health services offered in a variety of health care settings. Although a patient's health care may involve many different providers and settings (discussed in Chapter 11), the nurse is often the primary person responsible for communicating the patient's needs, teaching self-care, and, in many instances, providing care. As a result, one of the primary responsibilities of the nurse as caregiver is ensuring continuity of care.

Continuity of care is a process by which health care providers give appropriate, uninterrupted care and facilitate the patient's transition between different settings and levels of care. Continuity of care ensures a smooth transition between ambulatory or acute care and **home health care**, or other types of health care in community settings. Continuity depends on excellent communication as patients move from one caregiver or health care site to another. Too often, communication breakdowns among caregivers result in medical errors or deficient plans of care. In recent years, **patient handoffs**—transferring responsibility for a patient from one caregiver to another with the goal of providing timely, accurate information about a patient's care plan, treatment, current condition, and anticipated changes (Runy, 2013)—have been carefully researched. In 2006, The Joint Commission National Patient Safety Goals required hospitals to implement a standardized approach to handoff communications that includes:

- The handoff situation
- Who is, or should be, involved in the handoff communication
- Opportunities for people involved in handoffs to ask and respond to questions
- An outline for when to use certain communication techniques, such as repeat-back or read-back or the SBAR technique
- What print or electronic information should be available during the handoff (The Joint Commission, 2017)

In 2010, the requirement became a standard. On September 12, 2017 the Joint Commission issued a Sentinel Alert Event 58 providing advice to senders and receivers of handoff communication (https://www.jointcommission.org/-

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

/media/tjc/documents/resources/patient-safety-topics/sentinel-event/sea_58_hand_off_comms_9_6_17_final_(1).pdf).

One popular approach to handoffs is the **situation–background–assessment–recommendation (SBAR)** strategy mentioned above and described in Chapter 8. According to the Institute for Healthcare Improvement (2017), SBAR provides a framework for communication between members of the health care team about a patient's condition. It is an easy and focused way to set expectations for what will be communicated and how between members of the team, which is essential for developing teamwork and fostering a culture of patient safety. See Box 12-1 for examples of simple SBAR communications. **ISBARQ** is a revised approach, adding introduction and question and answer components to SBAR (Runy, 2013):

I—Introduction: People involved in the handoff identify themselves, their roles, and their jobs

S—Situation: Complaint, diagnosis, treatment plan, and patient's wants and needs

B—Background: Vital signs, mental and code status, list of medications, and lab results

A—Assessment: Current provider's assessment of the situation

R—Recommendation: Identify pending lab results and what needs to be done over the next few hours and other recommendations for care

Q—Question and answer: An opportunity for questions and answers

Figure 12-8 (on page 314) illustrates a format for a more complex handoff. Following are 10 tips for effective handoffs (Runy, 2013):

. Allow for face-to-face handoffs whenever possible.
. Ensure two-way communication during the handoff process.
. Allow as much time as necessary for handoffs.
. Use both verbal and written means of communication.
. Conduct handoffs at the patient bedside whenever possible. Involve patients and families in the handoff process. Provide clear information at discharge.
. Involve staff in the development of handoff standards.
. Incorporate communication techniques, such as SBAR, in the handoff process. Require a verification process to ensure that information is both received and understood.
. In addition to information exchange, handoffs should clearly outline the transfer of patient responsibility from one provider to another.
. Use available technology, such as the electronic medical record, to streamline the exchange of timely, accurate information.
. Monitor use and effectiveness of the handoff. Seek feedback from staff.

Read more about patient handoffs in Chapter 20.

TeamSTEPPS is an evidence-based teamwork system designed for health care professionals to improve patient safety and improve communication and teamwork skills among health care professionals. The system is rooted in more than 20 years of research and lessons from the application of teamwork principle (Agency for Healthcare Research and Quality [AHRQ], 2017). TeamSTEPPS uses a variety of team strategies and tools to enhance performance and patient safety, including the SBAR tool for shift-to-shift handoffs and for situations that require immediate attention and action.

Another tool, increasingly used by nurses to get a supervisor's attention when it's really needed, is CUS: I am **C**oncerned, I am **U**ncomfortable, I believe **S**afety is at risk. *Example*: "I'm concerned that Ms. C is not her usual self. I'm uncomfortable that she is behaving so oddly. I believe she is not safe; she may have something serious going on that we are missing."

The Joint Commission Center for Transforming Healthcare (2012) describes targeted solutions for five specific causes of communication failures, as shown in Figure 12-9 (on page 315).

Box 12-1 **Sample SBAR (Situation–Background–Assessment–Recommendation) Communications**

SBAR Scenario #1

RN calling provider regarding patient's elevated temperature, breathing difficulties, and deteriorating condition

S—"Jeff's temperature this evening shot up to 103°C, and his respirations are labored; RR of 40, HR of 95 BPM, and O_2 Sat of 82% on room air. He is pale and also drooling."

B—"Jeff was transferred 2 days ago from the state home for children with respiratory difficulties. Jeff is a 9-year-old with a genetic disease that includes severe intellectual disability."

A—"I am concerned about Jeff's deteriorating condition."

R—"Another nurse is staying with Jeff, offering O_2 and positioning and suctioning, but I need you to come

to the bedside and assess this patient."

SBAR Scenario #2

RN calling team manager regarding home hospice patient's inadequate pain management

S—"Ms. Tadesse is grimacing and moaning—she appears uncomfortable."

B—"She is in end-stage breast cancer and her family has been told that death is imminent—expected sometime this week."

A—"Her daughter has been administering the PRN morphine sulfate as ordered, but it no longer seems to be keeping her mother comfortable."

R—"Should we have the palliative care provider reevaluate Ms. Tadesse's analgesics and recommend a better pain management regimen?"

SBAR Scenario #3

RN calling provider about inadequate social support services for a patient scheduled for a discharge from a hospital rehab unit to home

S—"Mr. Ames is scheduled for discharge today. His wife appeared to "take him home" and arrived via taxi. She is a frail, 89-year-old woman who seems overwhelmed by the care she will need to provide in the home. She states that there are no families or friends capable of helping her care for her husband."

B—"Mr. Ames has spent the last week in a hospital rehabilitation unit following a right-sided total knee replacement. He weighs 320 lb. He has signed the discharge papers. There is no home care follow-up ordered."

A—"I am concerned about the Ameses because Mr. Ames still needs help ambulating. Prior to his surgery, Mr. Ames, who is 75 years old, was the primary caretaker for the couple. Without good home care services, I am concerned about their ability to manage."

R—"Should we invite the social worker and the case manager to reevaluate this family prior to his discharge and set up visiting nurses to assist?"

INTERPROFESSIONAL COLLABORATIVE PRACTICE

The "old" definition of teamwork in health care was working side by side with other health care professionals while performing your own skills. The Quality and Safety Education for Nursing (QSEN) project now defines teamwork as functioning effectively within your professional and interprofessional teams, fostering open communication, mutual respect, and shared decision making to achieve quality patient care (qsen.org). In 2011, the American Association of Colleges of Nursing partnered with other professional groups to establish core competencies for interprofessional collaborative practice. The World Health Organization (WHO) defines interprofessional **collaborative practice** as what happens when multiple health workers from different professional backgrounds work together with patients, families, carers, and communities to deliver the highest quality of care (WHO, 2010). The goal is to deliberatively work together to build a safer and better patient-centered and community/population-oriented U.S. health care system.

Components of Effective Team Structure

According to Salas et al. (2008), a team is composed of two or more people who:

- Interact interdependently and adaptively
- Have complementary skills
- Have effective leadership
- Work toward a common goal (*This is the MOST important component of team structure. Knowledge of the common goal accounted for 14% of the difference in team function.*)
- Have clear roles and responsibilities (*This is the second most important component of team structure; it accounted for 12% of the difference in team function.*)
- Hold themselves mutually accountable for achieving the goal

Core Competencies for Interprofessional Collaborative Practice

The IPEC core competencies were first adopted in 2011 and then updated in 2016. The 2016 update reflects two significant changes in the health care system, the increasing focus on the Triple Aim (improving the experience of care, improving the health of populations, and reducing the per capita cost of health care) and the implementation of the Patient Protection and Affordable Care Act; see Chapter 11. You can read more about these competencies in Chapter 14. Also note that *The Essentials: Core Competencies for Professional Nursing Education* now includes a sixth competency: Interprofessional partnerships. Its sub competencies align with these Interprofessional Education Collaborative competencies:

- Values and ethics

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

- Roles and responsibilities
- Communication
- Teams and teamwork

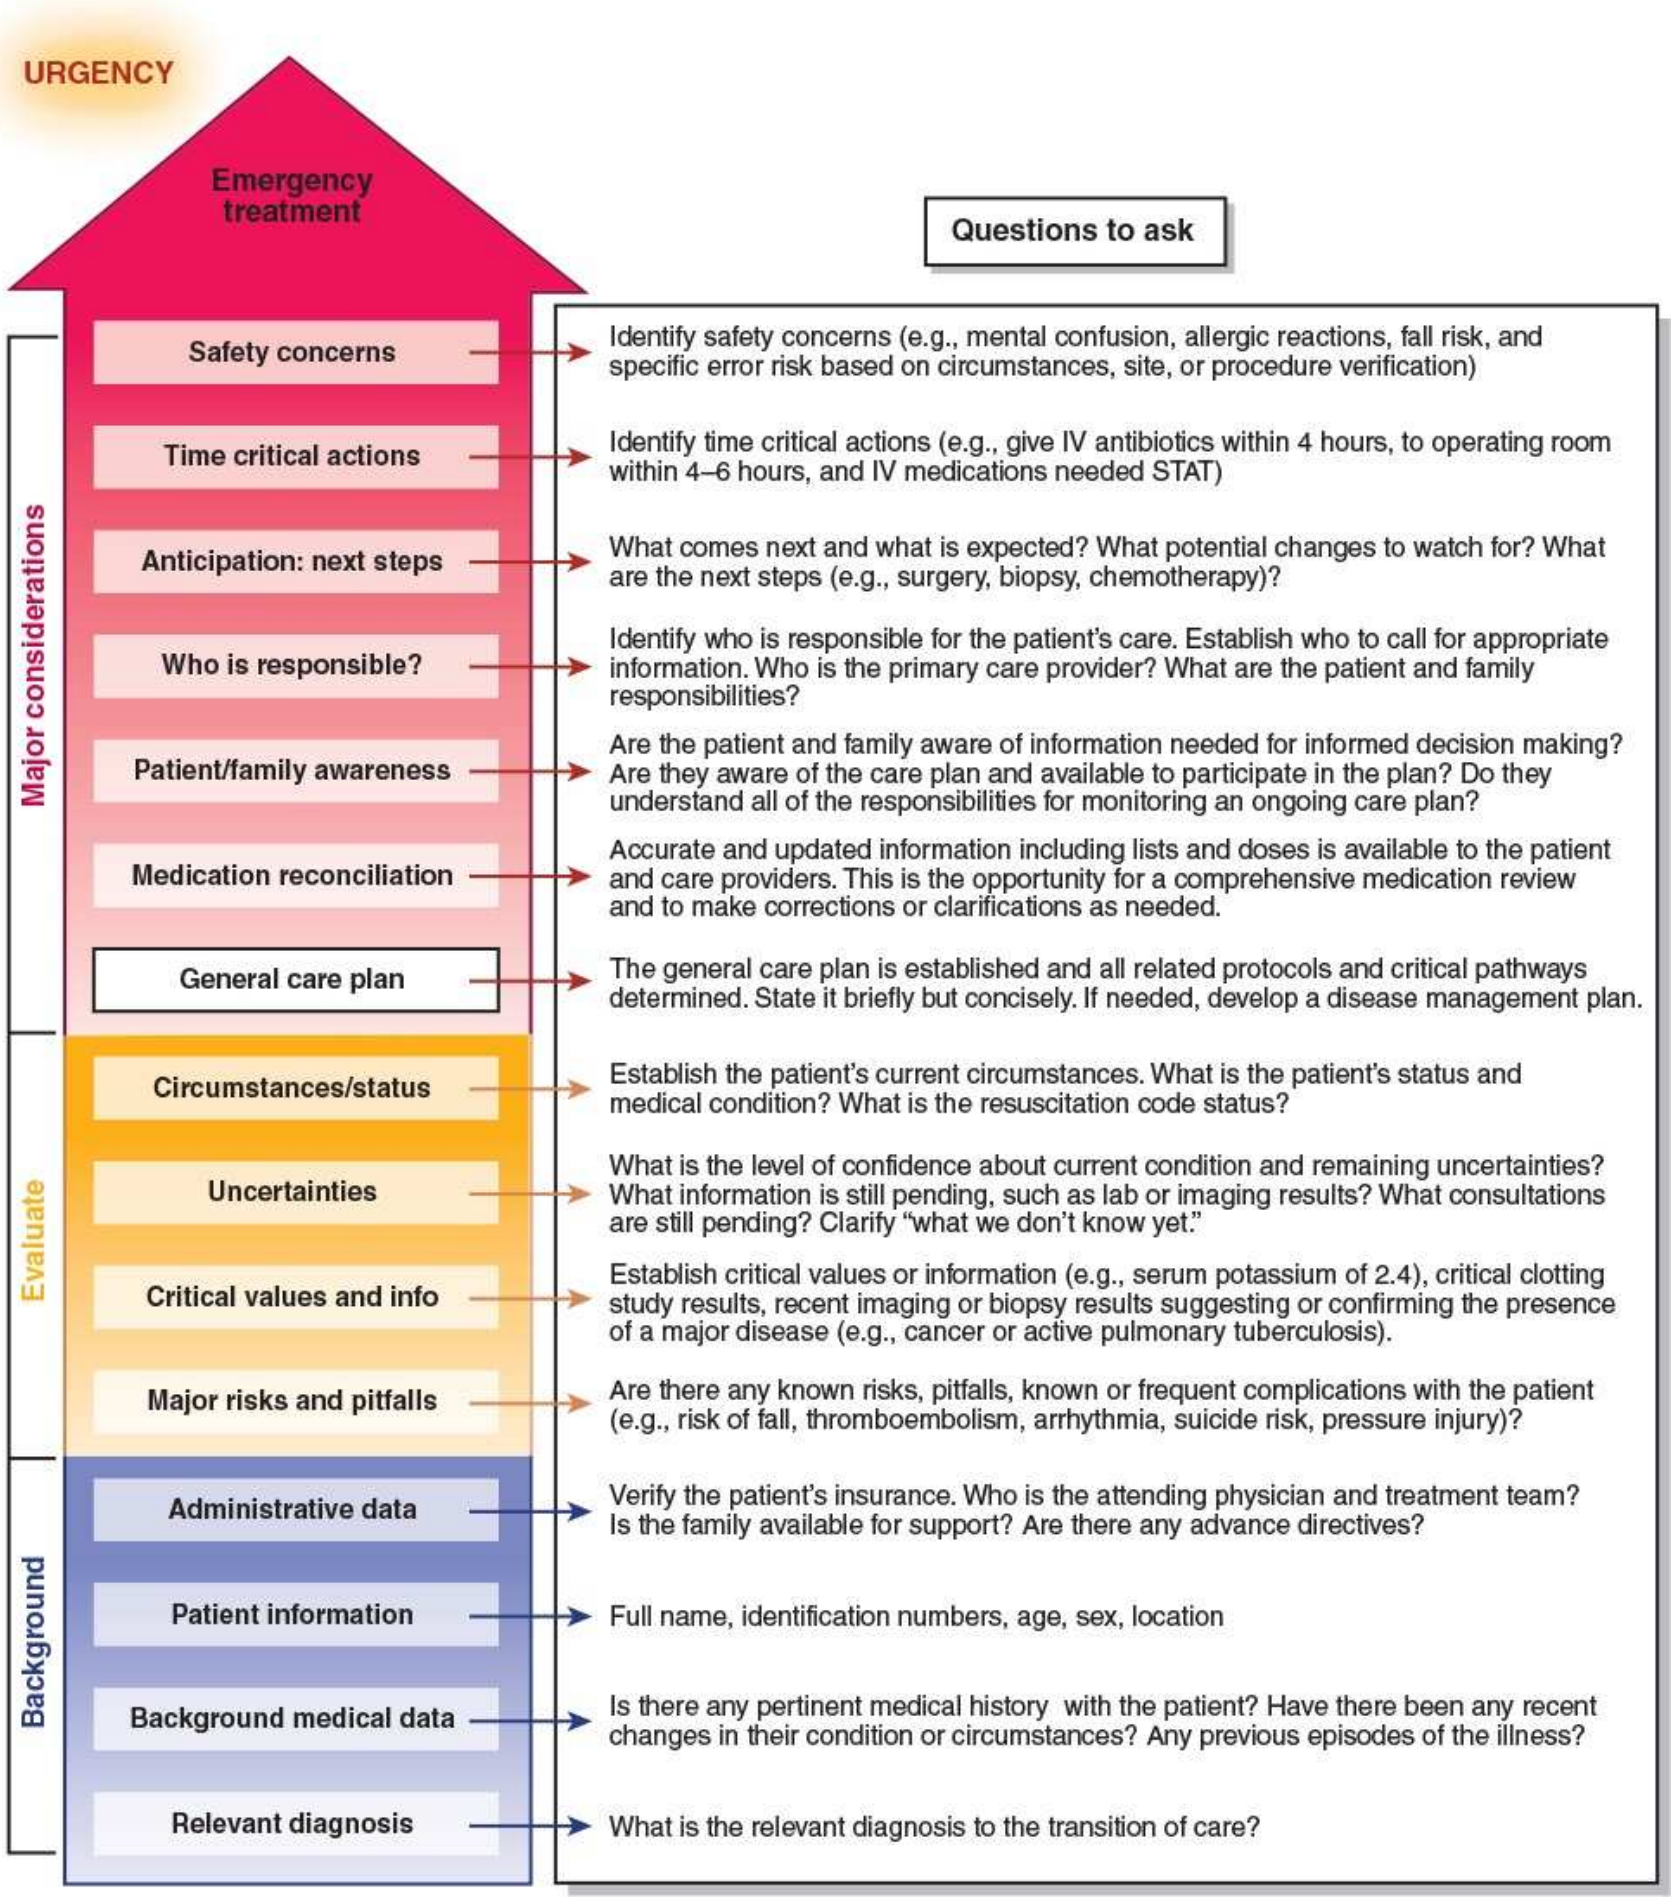

FIGURE 12-8. The U.S. Department of Defense Handoff Model. (*Source:* Reprinted from Healthcare Team Coordination Program. [2005]. *Department of Defense Patient Safety Program: Healthcare communications toolkit to improve transitions in care*. Department of Defense Patient Safety Program.)

Competency 1

Work with individuals of other professions to maintain a climate of mutual respect and shared values. (Values/Ethics for Interprofessional Practice)

Competency 2

Use the knowledge of one's own role and those of other professions to appropriately assess and address the health care needs of patients and to promote and advance the health of populations. (Roles/Responsibilities)

Competency 3

Communicate with patients, families, communities, and professionals in health and other fields in a responsive and responsible manner that supports a team approach to the promotion and maintenance of health and the prevention and treatment of disease. (Interprofessional Communication)

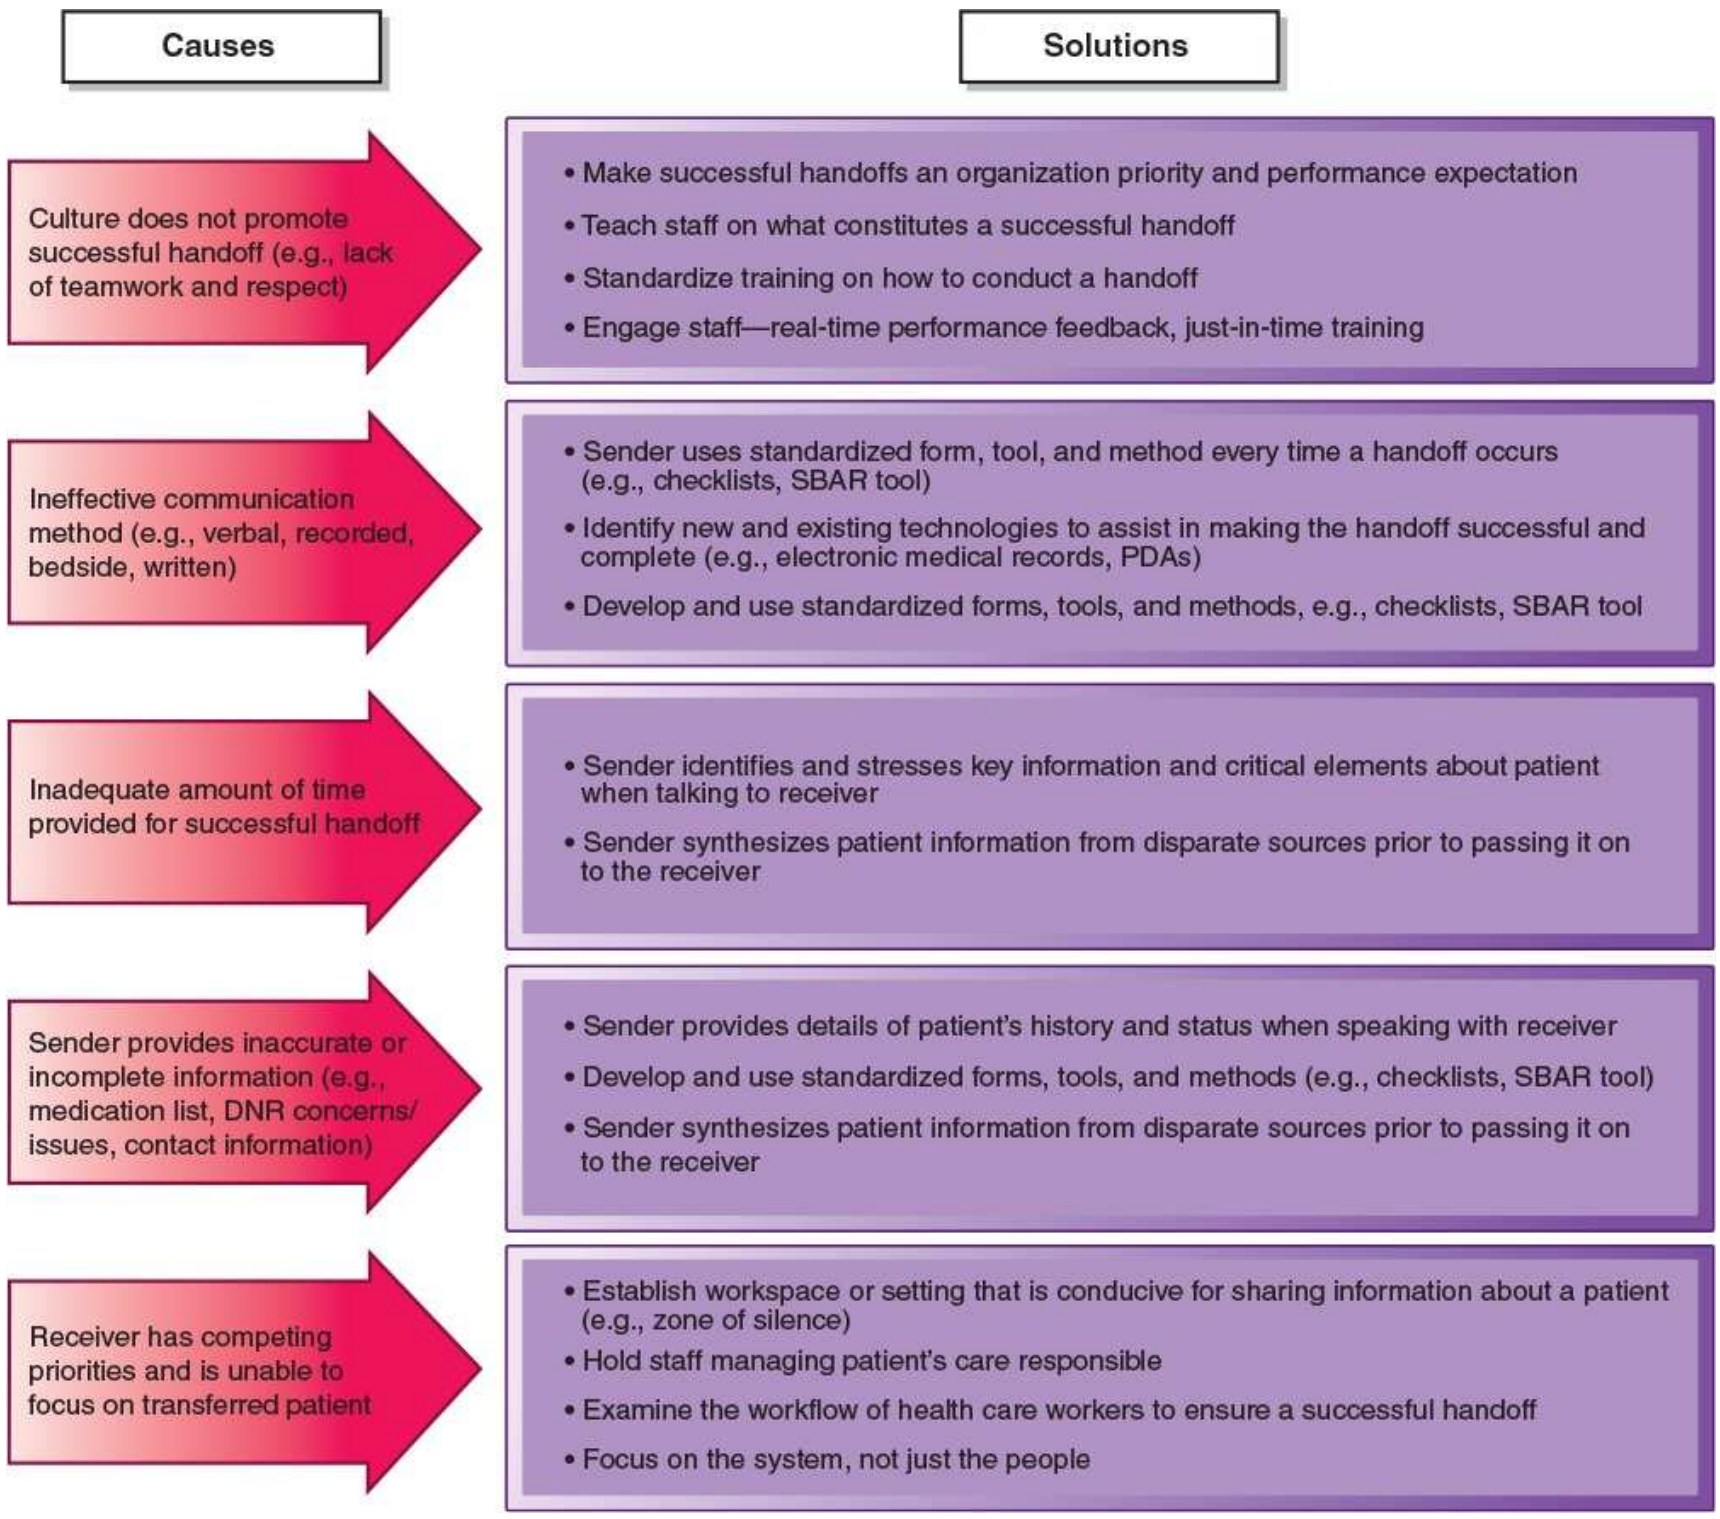

FIGURE 12-9. Targeted solutions for specific causes of communication failures. (*Source:* Reprinted with permission. Agency for Healthcare Research and Quality [AHRQ]. [2012]. *Improving transitions of care: Hand-off communications*https://psnet.ahrq.gov/. Joint Commission Center for Transforming Healthcare.)

Competency 4

Apply relationship-building values and the principles of team dynamics to perform effectively in different team roles to plan, deliver, and evaluate patient/population-centered care and population health programs and policies that are safe, timely, efficient, effective, and equitable. (Teams and Teamwork)

As you begin to develop the knowledge, attitudes, and skills for interprofessional collaborative practice, you'll want to ask yourself these questions:

- What will I bring as strengths to collaborative practice?
- What about me might be problematic for my team?
- How will this self-knowledge direct my goals for self-development?

Chapter 11 describes the responsibilities of different members of the interprofessional health care team. Try to learn about the roles and responsibilities of your team colleagues as you begin practice. Sigmon (2020) notes that interprofessional collaborative teams that include nurses, physicians, social workers, pharmacists, and physical and occupational therapists can help health care organizations improve patient and family experiences, ensure good outcomes, and reduce costs while simultaneously enhancing the workplace. She is quick to point out that even when teamwork and collaboration are a job requirement, effective collaboration can be challenging. See Table 12-1 (on page 316) for strategies you can use to improve collaboration and see how many are in place during your clinical rotations.

Table 12-1	Interprofessional Collaboration Made Easy
Safety huddles	Short (less than 10 minutes) interprofessional safety huddles held at the beginning of each shift focus on safety and quality successes and concerns from the previous day, discussing safety and quality issues for patients on the day's schedule, updating mandated quality and safety measures, encouraging input about other safety

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

	and quality concerns, and sharing announcements or information.
Patient rounds	The goal of interprofessional team rounding with the patient and family is to share critical patient care information and develop a collaborative care plan. Optimally these are done at bedside and include the patient and family. The team discusses the patient's health and family concerns, daily care, treatment goals, and discharge plans. Health, quality, and safety matters are reviewed, and all team members participate in decision making.
Safety rounds	The safety team typically divides its members into pairs who walk through up to eight patient care areas and meet with various staff members. Using scripted questions, the teams talk with staff from all professions and record their comments, identifying their roles but not their names. At debriefings the safety team evaluates near miss causes, adverse events and safety issues. When concerns are noted, an action plan is developed to address them, and specific staff members are assigned for follow up. The aim is to promote a just culture (see Chapter 7) that focuses on evaluating choices and processes that impact safety and quality, not the outcome of the event or assigning blame.
Daily goals worksheet	The aim is to identify one or two daily targets for patients to meet and improve their care. The worksheets help communicate patient needs and risks to the interprofessional teams and verify goal completion.
Shared care and discharge plans	A shared care and discharge plan—written or as part of the patient's electronic health record—can be used for interprofessional team collaboration in all clinical settings. Rather than depending on separate medical, behavioral, and nursing treatment plans, a shared plan combines all aspects of care, with each team member offering a unique perspective that enhances a holistic care approach. When patients and family members are included, they have an opportunity to develop, participate in, and negotiate their care, voice their concerns, and ensure they are ready for discharge.
Structured family meetings	The meeting should have a leader who creates an agenda, structures the meeting, summarizes the discussion for all participants, assigns team members to take action, and conducts follow-up. Active patient participation (talking to the patient rather than about them) can help increase patients' sense of independence and improve adherence to the plan of care. Structured interprofessional family meetings also can increase care team empathy.
Shared training	When health care professionals and staff attend continuing education and training sessions together, they are in a risk-free environment that gives them insight into each other's roles. Talking freely about a common goal can help team members empathize, appreciate the challenges of other professions, and strengthen bonds.

Unfolding Patient Stories: Vernon Russell • Part 1

Vernon Russell—a 55-year-old who presents with left hemiplegia, garbled speech, and confusion—is admitted to the hospital with a stroke. He is divorced and lives with his son. What concepts would the nurse need to integrate to establish an effective, professional relationship with Vernon and his son? How does the nurse promote coordination of care between the interprofessional team members for stroke management? (Vernon Russell's story continues in Chapter 43.)

Care for Vernon and other patients in a realistic virtual environment: vSim for Nursing (thepoint.lww.com/vSimFunds). Practice documenting these patients' care in DocuCare (thepoint.lww.com/DocuCareEHR).

CARE COORDINATION

A 2012 Health Policy Brief produced by *Health Affairs*, a journal on health policy, describes **care transition** as a continuous process in which a patient's care shifts from being provided in one setting of care to another, such as from a hospital to a patient's home or to a skilled nursing facility and sometimes back to the hospital. It reports: "Poorly managed transitions can diminish health and increase costs. Researchers have estimated that inadequate care coordination, including inadequate management of care transitions, was responsible for $25 to $45 billion in wasteful spending in 2011 through avoidable complications and unnecessary hospital readmissions" (Burton, 2012). Because of all the complexities in delivering safe and affordable health care of good quality (see Chapter 11), care coordination has emerged as a central responsibility of all health care professionals, and especially nurses. In simple terms, care coordination is a mechanism to make sure that patients get the right care at the right time in the most efficient and cost-effective manner, by the right person in the right setting. The aim is to link patients with resources in the community to enhance their well-being, improve information exchange, and reduce fragmentation and duplication of services.

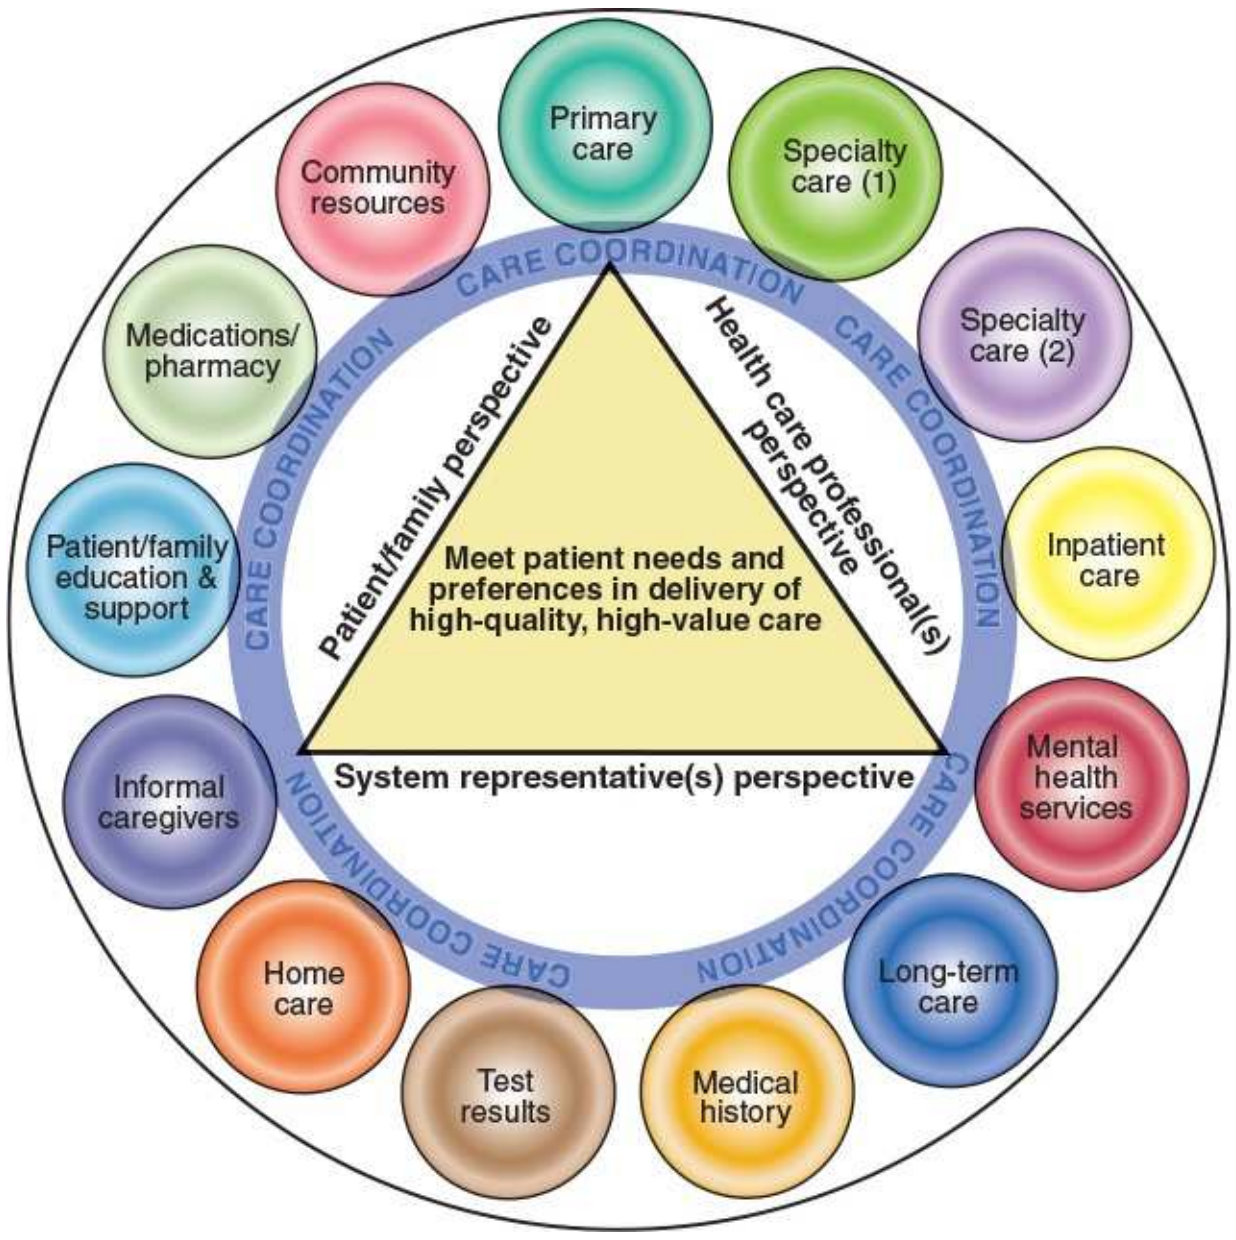

FIGURE 12-10. Care Coordination Ring. The central goal of care coordination is shown in the middle of the diagram. The *colored circles* represent some of the possible participants, settings, and information important to the care pathway and workflow. The *blue ring* connecting the *colored circles* is Care Coordination—namely, anything that bridges gaps (*white spaces*) along the care pathway. (*Source:* Reprinted with permission from McDonald, K. M., Schultz, E., Albin, L., Pineda, N., Lonhart, J., Sundaram, V., Smith-Spangler, C., Brustrom, J., & Malcolm, E. [2010]. *Care Coordination Atlas Version 3 [prepared by Stanford University under subcontract to Battelle on Contract No. 290–04–0020]. AHRQ publication No. 11–0023-EF*. Agency for Healthcare Research and Quality.)

A recent systematic review (AHRQ, 2014a) identified over 40 definitions for **care coordination**. The reviewers proposed the following broad definition: "Care coordination is the deliberate organization of patient care activities between two or more participants (including the patient) involved in a patient's care to facilitate the appropriate delivery of health care services. Organizing care involves the marshaling of personnel and other resources needed to carry out all

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

required patient care activities and is often managed by the exchange of information among participants responsible for different aspects of care." Figure 12-10 illustrates care coordination.

Successes and failures in care coordination will be perceived in different ways by patients and families, health care professionals, and system representatives. Patients and families are pleased when care coordination helps ensure that the patient's needs and preferences for health services and information sharing across people, functions, and sites are met over time. Patients are unhappy during transitions to different providers and settings when communication regarding their history and health care needs requires more effort. According to the AHRQ review, health care professionals notice failures in coordination particularly when the patient is directed to the wrong place in the health care system or has a poor health outcome as a result of poor handoffs or inadequate information exchanges. They also perceive failures when they are obliged to exert an unreasonable effort to accomplish coordination during transitions to other health care entities. System representatives focus more on coordination failures when patients experience a clinically significant mishap from fragmentation of care or when system finances are adversely affected, such as when a preventable hospital readmission occurs.

Validation of Nursing Care Coordination Activities

Nurses have long been involved in care coordination activities, but only recently have these efforts been recognized as an integral contribution to effective and efficient use of health care resources and quality patient outcomes. Nurses have long developed care plans that account for patients' needs and preferences, conducted health teaching for patients and their families prior to discharge, and coordinated care across a variety of settings following discharge from a health care facility. It is who nurses are and what they do. The ANA launched an effort to validate the care coordination activities of RNs and seek funding for these essential components of patient care. Its position statement affirms the vital role that nurses play in the care coordination process, either as members of a multidisciplinary health care team or independently within the scope of their nursing practice. These efforts result in improved patient outcomes, increased efficiency in health care systems, and lower health care costs (American Nurses Association [ANA], 2014).

Bracken (2016) an acute care nurse practitioner, described how nurse practitioners can use a provisional bundle of predischarge, postdischarge, and bridging interventions to decrease costly readmissions for patients with chronic obstructive pulmonary disease. She identified three care models to increase safe transitions:

- High-intensity care team led by both a nurse practitioner and a social worker to support the primary care provider (PCP) and support high-risk patients through the discharge process
- Integration of community health workers or patient navigators into the inpatient unit to help identify barriers to care at home before discharge, followed by a home visit within 48 hours of discharge
- Disease-specific, postdischarge care clinic staffed by a multidisciplinary team, with all patients admitted for a specific condition scheduled in the clinic within 1 week of hospital discharge (p. 25).

Why Care Coordination Now?

Changing demographics (e.g., increasing numbers of older adults), increasing chronic illness, and the increasing availability of costly medications and treatments have all led to a heavy demand for care coordination. Care coordination is especially important following the passage of the Patient Protection and Affordable Care Act (PPACA). Financial incentives are shifting from giving more care (under the fee-for-service model) to providing more integrated, less costly care. The move toward "bundled payment" with shared savings provides incentives for care coordination and avoids fragmentation or duplication of services. Costs decrease when better information exchanges reduce the need for repeat procedures, which often happen when one provider doesn't know what others have ordered. Quality of care is enhanced when better handoffs result in treatment plans being aligned across settings. Chapter 11 describes some of the models of care coordination: providers and hospitals, multispecialty group practice, community health centers, prepaid group practice, accountable care organizations, and medical homes/medical neighborhood. Care coordination in discharge planning is addressed later in this chapter.

Nurse Self-Care Alert

One of the greatest sources of moral distress for nurses (see Chapter 6) is not being able to make health care work for those who need it. Limited access to necessary services coupled with limited resources for those without health insurance or independent means to pay for needed care means many families suffer without appropriate care to keep them healthy or to promote recovery (Olsen & Keilman, 2020). Look for moral distress resources in your clinical practice sites and talk with nurses about how they cope.

Care Coordinator

The **care coordinator** is the care provider (nurse case manager, social worker, community health worker, or lay person) who is responsible for identifying a patient's health goals and coordinating services and providers to meet those goals. To be effective, care coordinators must have expertise in self-management and patient advocacy, and must be adept at

navigating complex systems and communicating with a range of people, from family members to PCPs and specialists. It is the responsibility of the care coordinator to identify life and health goals with the patient and to coordinate services and community supports to work with the patient and family toward better health outcomes. The care coordinator must also understand the strengths and gifts that the individual and family bring (their "assets").

This begins with conversations between the care coordinator and the patient about life goals and health goals, and how they interact. These conversations must be nonjudgmental, with the care coordinator taking an open, learning stance to understand the person's life context, challenges, struggles, and gifts. The care coordinator has ultimate responsibility for ensuring that the care plan is delivered as described, and for incorporating new knowledge to keep the care plan fresh and relevant. As the care coordinator and patient learn more about what promotes and what gets in the way of improved health, they are able to modify the care plan to meet the person's emerging strengths and needs.

Patient navigation is just one of the new roles being developed to fill a void in care coordination. The Academy of Oncology Nurse & Patient Navigators clarifies the difference between a nurse navigator and a patient navigator in the context of the patient with a cancer diagnosis:

Nurse navigator: This term describes a clinically trained nurse responsible for the identification and removal of barriers to timely and appropriate cancer treatment. The nurse navigator guides the patient through the cancer care continuum from diagnosis through survivorship. More specifically, the nurse navigator acts as a central point of contact for a patient and coordinates all components involved in cancer care, including surgical, medical, and radiation oncologists; social workers; patient education; community support; and financial and insurance assistance. The nurse navigator has the clinical background to perform this role and is a critical member of the multidisciplinary cancer team.

Patient navigator: This term describes all types of navigators; the patient navigator may be a nurse, a social worker, or a lay person. The primary distinction is that the patient navigator (1) does not necessarily have a clinical background and (2) focuses on the support aspects of care. Thus, a lay person or a social worker can be a patient navigator. Depending on the patient navigator's background and training, their function can vary. In general, the patient navigator provides assistance with scheduling, financial assistance, psychosocial support, and community support.

See Figure 12-11 for an example of how an oncology nurse navigator might assist a patient newly diagnosed with cancer.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

FIGURE 12-11. An example of an oncology nurse navigator. (*Source:* Adapted with permission of *The Wall Street Journal* from Landro, L. [2011, August 16]. When a doctor isn't enough. Nurse Navigators help patients through maze of cancer-treatment decisions, fears. *The Wall Street Journal*. http://online.wsj.com/article/SB10001424053111904253204576510472828240848.html. Populations With Special Care Coordination Needs

Vulnerable populations are groups that are not well integrated into the health care system because of ethnic, cultural, economic, geographic, or health characteristics. Their isolation can result in these groups not obtaining necessary health care. Examples of vulnerable populations include:

- people with disabilities or multiple chronic conditions. (Think of Jeff Hart, the 9-year-old boy with severe intellectual disability, and review the case study of the Saxas presented in Box 12-2 on page 320.)
- people with mental illnesses or substance use disorders. See Figure 12-4, for facts about "Mental Health in My Community."
- cultural, racial, and ethnic minorities.
- people experiencing poverty in rural and urban areas, including those who are homeless.
- undocumented immigrants.

Nurses are often on the front lines of advocating for these groups, but advocacy requires special knowledge, attitudes, and skills. We all have to ask ourselves, first, if we may have biases that interfere with our willingness to create respectful patient-centered partnerships with vulnerable people. Do we believe that people with substance use disorders, people who are homeless, older adults, or people who do not speak English deserve the same respectful, compassionate, person-centered care that we would want for those we love most? Are we moved by the plight of those most in need? You will find vulnerable population alerts scattered throughout the text.

Box 12-2 **Care Coordination and Continuity Case Study**

Read this scenario and discuss your answers to the questions that follow with your fellow students.

Mr. and Mrs. Saxa are an older couple (both in their mid-70s) who live independently. They live in the same house they raised their family in and are active members of their church. They have two grown children who live across the country but who are attentive and visit regularly, and they have four young grandchildren. Mr. Saxa is still driving, but his children are increasingly concerned about his safety behind the wheel.

Mrs. Saxa has type 1 diabetes and hypertension but has been able to manage her diet well and maintains good control of her hypertension with her medications. She takes six medications.

Mr. Saxa is also hypertensive, and recently underwent hip replacement surgery. While hospitalized for this surgery, he developed some difficulty urinating, and now sees a urologist. He also began anticoagulation therapy while hospitalized. Despite these issues, he has done quite well postoperatively, progressing from a walker to a cane that he now uses for stability. He currently takes seven medications.

The Saxas have a primary care provider (PCP) who has been their “family doctor” for decades. He is in a solo practice and does not have an electronic medical record system. In addition to their PCP, Mrs. Saxa sees an endocrinologist and a cardiologist, and Mr. Saxa sees a cardiologist, a urologist, and an orthopedic surgeon.

Mr. Saxa is a plumber. Mrs. Saxa did some secretarial work years ago but has primarily been a homemaker. Since Mr. Saxa retired and his employer does not offer retiree benefits, they rely on Medicare. They have a small nest egg of about $45,000.

In September, Mrs. Saxa has an episode of chest discomfort and shortness of breath and is taken to the emergency department (ED) of the local hospital. A hospitalist evaluates her in the ED and sends her to the lab for blood work and to the radiology department for a chest film. He calls in a cardiology consult and subsequently admits her to the critical care unit with a diagnosis of congestive heart failure, ruling out myocardial infarction, renal insufficiency, and rheumatoid arthritis. The cardiologist on call orders a cardiac catheterization to rule out coronary artery disease. She is found to have significant occlusion of the left anterior descending artery and the right coronary artery. A cardiovascular surgeon is consulted and a coronary artery bypass graft (CABG) is scheduled and later performed.

Mrs. Saxa recovers from the surgery and is discharged to a rehabilitation facility. While she is in rehabilitation, there is an outbreak of seasonal flu, and although Mrs. Saxa doesn’t actually get the flu, she is significantly affected by staffing shortages. Meanwhile, Mr. Saxa is urged by his daughter to get a flu shot. Since his PCP is on vacation, he goes to an urgent care center in his local strip mall, where the nurse practitioner administers the flu shot. Mrs. Saxa receives physical and occupational therapy three times a week in rehab and does quite well. She is discharged from rehab after 1 month and is referred to home health care.

Two weeks after her discharge, Mrs. Saxa suffers a stroke and is readmitted to the hospital. Two weeks later she is again discharged to rehab, where she experiences another stroke, which leaves her with significant hemiparesis. Her progress is limited, and she is admitted to a long-term care facility. Mr. Saxa is now adamant about continuing to drive because he visits his wife daily. He is worried about how long they will be able to afford the long-term care facility, which is the only one close to their home.

Questions for Reflection and Discussion

1. What are the main health issues that would concern you with this family? What sort of nonphysical health care needs are the Saxas experiencing? Who is most likely to identify and respond to these needs?
2. What is reasonable for the Saxas to expect of the nurses they encounter in each of the health care settings they experience?
3. How likely are the professional caregivers who encounter the Saxas in their multiple care settings to have complete histories of this couple, including both their medical and social histories? Would an electronic medical history that could be made available to new health care providers be helpful? Would an implantable microbiochip capable of being scanned and linked with medical records access be helpful? Could this information be misused?
4. How do the Saxas’ various professional caregivers learn about new medications or treatments ordered by each other? Are there concerns with this?
5. How do you think the Saxas selected their professional caregivers and health care services? Do they have any way of knowing what quality to expect? If they are dissatisfied with the care they receive, what avenues are open to them to express their displeasure?

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

6. Make a list of all the different health care settings the Saxas are likely to experience. How well do you understand the services provided in each setting? What criteria would you use to select an excellent facility or service?
7. Make a list of all the different health care providers the Saxas are likely to experience. How well do you understand their respective roles? What criteria would you use to evaluate their care?
8. How will the Saxas' provider visits and hospitalizations be paid for? Will the Saxas bear any financial burden? What health care costs are they likely to incur? Medications? Medical supplies?
9. Think about how the Saxas' experience would differ if they were members of a vulnerable population, for example, experiencing poverty in an urban area, recent immigrants, non–English-speaking, rural, etc.
10. Who, if anyone, is best qualified to coordinate the care the Saxas are receiving? How likely are they to experience satisfactory care coordination and continuity?

Source: Adapted from Dr. Patricia Cloonan, Georgetown University School of Nursing and Health Studies.

In 2013, a columnist for *The Washington Post* wrote about a "scary, abandoned hospital" in Washington, DC (the city had a $417 million budget surplus at the time) that was serving as a makeshift family homeless shelter; no one seemed to care about 600 kids crammed inside. "Stop and think about that. Six hundred kids with chubby cheeks and Spider-Man sneakers and Dora hats are beginning their journey in life on an army cot in a cafeteria or an old hospital bed in a city shelter. And that's an improvement from the time they spent sleeping in cars, bus shelters, Metro stations, apartment–house lobbies or on a different couch every night" (Dvorak, 2013). Nurses have a proud tradition of seeking to meet the needs of the most vulnerable; will the next generation of nurses continue this?

Nurses also need specialized knowledge and skills to serve these people. It takes a special effort to "walk in the shoes" of a teenage single mother with three children under the age of four, or a homeless man with a history of chronic drug and alcohol abuse, to learn about who they are, what they need, and how best to help them. Think about a vulnerable population where you live, and try to interview some of its members. See if your class can devise a strategy to learn about them and then begin to meet their needs. Think about how community-based care coordination efforts can improve the health and well-being of the most vulnerable in your region.

Admissions, Transfers, and Discharges

As a result of increasing costs and of health care cost reimbursement programs that are prospective rather than retrospective (meaning that costs are predetermined for specific illnesses or treatments, including severity of illness and cost of care), hospital admissions and lengths of hospital stay have decreased. More patients are having surgery, diagnostic tests, and emergency care in ambulatory care settings or on a hospital outpatient basis. The 2020 pandemic further reduced visits to the hospitals. Even patients who are admitted often stay for less than 24 hours, are admitted the morning of the surgery, or go home during an interim period between diagnosis and care. All this makes care coordination particularly challenging.

All people who enter a health care setting take on a new role. They must add to their already established roles (e.g., spouse, parent, sibling, student) the role of patient. They also enter an environment in which strangers surround them and in which they encounter different sounds, sights, and smells. A competent, responsible, and caring nurse can make all the difference to an anxious, frightened, or confused patient and family.

To meet patients' health care needs during the admission process, nurses provide holistic care and establish the basis for how patients will respond to and evaluate the remainder of their stay. Box 12-3 describes guidelines for establishing an effective nurse–patient relationship to ensure that each patient is considered as a unique person who merits respect in any setting.

During admission, the nurse acts not only as a health care provider but also as an advocate concerned about the welfare of the patient and the family. The admission period corresponds to the orientation phase of the helping relationship described in Chapter 15. In addition, regulatory guidelines direct both the continuity and the quality of care. For example, The Joint Commission standards for admission to a hospital assert that each patient's need for nursing care should be assessed by a registered nurse (RN). This assessment includes consideration of biophysical, psychosocial, environmental, self-care, educational, and discharge planning factors. In addition, nurses collaborate, as appropriate, with health care providers and members of other clinical disciplines to make decisions regarding the patient's need for nursing care.

Box 12-3 Establishing an Effective Nurse–Patient Relationship During Hospital Admission

- Recognize and take steps to reduce the patient's anxiety. Anxiety is a natural reaction to the unknown, but it can be reduced by therapeutic communication, teaching, and acceptance. Some common concerns that cause anxiety are: *Will I have pain? Who will take care of my family if I die? Will strangers be looking*

at my body? How much will this cost? What if I can't keep my job?
- Encourage the patient and family to participate in and make decisions about all aspects of care.
- Remember that the medical or surgical condition for which the patient is being treated is only one part of the patient's life. Other concerns include family needs, financial status, and the future.
- Communicate with patients as individuals so that they can maintain their own identity. Ask patients how you should address them; some people prefer Mr., Mrs., Miss, or Ms. (last name), whereas others would rather be called by their first name. Do not call all older adults "Grandma" or "Grandpa." Do not refer to Mr. Jones, admitted to room 2218 for treatment of a ruptured appendix, as "the appendix in 2218."
- Take time to learn who the patient being admitted is, including that patient's cultural and religious background. Respect the patient's values and beliefs even though they may differ from yours.

Admission to an Ambulatory Care Facility

In ambulatory care facilities, described in Chapter 11, the patient receives health care services but does not remain overnight. Ambulatory facilities include physician and nurse practitioner offices, clinics, hospital outpatient services, emergency departments (EDs), and same-day surgery centers. The goal of these facilities is to provide health care services to patients who are able to provide self-care at home. People go to ambulatory settings for health promotion, health maintenance, or medical or surgical treatment.

In most office and clinic facilities, patients enter a reception area where they are asked to complete a short health history (unless they have already done so during a previous visit) and sign a statement acknowledging the HIPAA privacy rule (see Chapters 7, 20, and 21). They then receive a physical assessment (often specific to the reason for the visit) in an examination room. Depending on their needs, patients may be given, for example, diagnostic tests, immunizations, or prescriptions for medications, or may undergo minor surgery. All patients require teaching, which should include written instructions about care at home, health promotion activities, and how to contact someone for further questions. Referrals to community facilities, support groups, or other types of health care settings may also be necessary.

Admission to ambulatory or same-day surgery facilities is somewhat different. Screening tests, teaching, and admission procedures are usually completed previously. Patients arrive at the setting, have the procedure, and go home when recovery is satisfactory. If patients have outpatient or short-stay surgery in the hospital setting, the regular admission procedures are completed on arrival; in most instances, screening tests and teaching are done before the day of surgery. It is the nurse's responsibility to assess what has been done and tailor the care plan to the patient's needs.

Concept Mastery Alert

Patients are admitted to all different types of ambulatory care facilities for many different reasons. Regardless of the setting or reason, teaching is a priority.

Admission to the Hospital

A scheduled admission to the hospital usually begins in the admitting office. Admitting office staff obtain information about the patient and input that information into the computer. The admission data become part of the patient's permanent record.

The identification number (often included as a barcode), as well as the patient's name, admitting provider's name, and any other information required by the particular institution, is printed on an identification wristband that is placed on the patient's wrist. This wristband is an important safety component during the patient's stay because it is one of two identifiers, required by the Joint Commission national safety standards, used to accurately identify a patient during activities such as medication administration, blood and fluid administration, diagnostic tests, and surgery. A wristband is worn by all patients. The patient's date of birth is commonly used as the second identifier.

During the initial interview, the admitting staff provide other information about legal and ethical components of care. The patient is asked to sign forms that give consent to treatment and allow the hospital to contact health care insurance companies or public facilities (e.g., Medicare) for reimbursement of services. Patients are asked if they have established advance directives, such as a living will or durable power of attorney, to indicate their treatment preferences about prolonging life. If they have established advance directives, a copy becomes a part of their hospital record. If they have not, the purpose is explained and they are given a form to complete if they wish to do so. (Chapter 44 discusses advance directives and provides a sample form.) Providers must give patients a clear written explanation of how health information will be used and disclosed, and the patient must sign a privacy statement. Patients may also be asked to provide the names of family or friends to whom health status information may be given. Finally, almost all hospitals give some form of a Patient Care Partnership (formerly titled a Patient Bill of Rights) to patients to inform them about what to expect while in the hospital. This document, usually available in several languages, includes the rights to high-quality hospital care, a clean and safe environment, involvement in care, protection of privacy, help when leaving the hospital, and help with insurance claims (American Hospital Association, 2003).

After the necessary forms have been completed in the admitting office, a nurse who works in that area may complete

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

the admission health history and physical assessment, or the patient may be taken to an assigned room for these admission procedures. Laboratory studies and x-rays, as well as the admitting office procedures, are usually completed on an outpatient basis before the day of admission. If the patient has an unscheduled admission or will have only a limited stay (e.g., a patient admitted the morning of a diagnostic examination who is intending to return home later that day), admission procedures and assessments may be completed on the unit.

PREPARING THE ROOM FOR ADMISSION

The admitting office notifies the unit to which the patient is to be admitted before the patient arrives so that the room can be prepared. Although the nurse may delegate most of the activities in preparing the room for an admission, it is a nursing responsibility to ensure that other personnel do them. Guidelines for Nursing Care 12-1 outlines the activities carried out in anticipation of the patient's arrival.

ADMITTING THE PATIENT TO THE UNIT

Although other members of the health care team may assist in the admitting procedure, the nurse is responsible for ensuring the patient's safety, comfort, and well-being upon arrival in the unit. The admitting nursing history and assessment are described in Chapter 15, where you will find examples of paper and electronic assessment records. The admission assessment is used to develop the nursing care plan for the patient and is also used as a database for discharge planning and home care. In addition, an inventory of personal belongings and valuables is completed to ensure their return to the patient on discharge or their transfer with the patient to another unit or facility. A **medication reconciliation** form is completed on admission. The form is checked and filled out again with each transfer and on discharge to ensure that all medications have been correctly ordered or discontinued as the patient moves through the system.

The nurse should welcome the patient to the unit in the same courteous manner as when welcoming a guest into their own home. In most instances, the patient will be accompanied by family members who may either remain with the patient to provide support and information or who may wait in the waiting room during the admission procedure. The nurse assesses the needs of the patient and family, and they should mutually agree about whether family should be present during admission.

Guidelines for Nursing Care 12-1

PREPARING THE ROOM FOR PATIENT ADMISSION

- Position the bed. For ambulatory patients, the bed should be in its lowest position. Place the bed in its highest position if the patient will arrive on a stretcher. Ensure that the furniture in the room is arranged to allow easy access to the bed.
- Open the bed by folding back the top bed linens (see photo).
- Assemble routine equipment and supplies. Place a hospital admission pack (which contains such items as a hygiene supplies, water pitcher, drinking glass, tissues, soap, and lotion) in the room. A hospital gown or pajamas should be in the room, although the patient may choose to wear their own pajamas or gown. Equipment for taking vital signs (i.e., stethoscope, sphygmomanometer, thermometer) and height and weight should be in the room or readily available. If laboratory work has not been done previously, a container for a clean urine specimen should be available.
- Make sure that the call light and TV remote control are readily available for the patient.
- Assemble special equipment and supplies. The patient may require oxygen therapy, cardiac monitoring, or suction equipment. Ensure that the equipment is functioning properly and is ready for the patient's use on arrival.
- Adjust the physical environment of the room; this may include turning on lights and setting the room temperature.

An “open” bed, ready for the patient’s arrival.

Transferring Within and Between Health Care Settings

Patients often move within a setting as well as between settings, as in these examples:

- Within the hospital, such as from the ED to a hospital room, from an intensive care unit (ICU) to a hospital room (and vice versa), from one unit to another, or from one room to another room on the same unit
- To and from acute care settings and long-term settings
- From acute care settings to the patient’s home
- From ambulatory care settings to acute care settings

When a transfer occurs, the patient must readjust to new surroundings, a new roommate, new routines, and new people providing care. If the transfer is to a higher level of care, as in a move to the ICU, the patient and family often experience unfamiliar sights and sounds. A transfer to a long-term care facility may not be desired by the patient or family but may be necessary if family members cannot provide care at home or if no other support people are available. All of these factors cause stress and anxiety.

Recall **Laura Degas**, the woman who is not sure if she will be able to care for her sister at home. If it is determined that Ms. Degas cannot care for her sister at home, she may decide to have her sister transferred to a long-term care facility. In this case, the nurse must provide Ms. Degas with support and guidance to ease the transition and help minimize the stress and anxiety of this move.

The nurse may not be responsible for the actual physical move but is responsible for ensuring that the comfort, safety, and teaching needs of the patient and family are met. Although documentation and procedures differ depending on the institution and type of transfer, patient needs are always a priority in ensuring a smooth transition and continuity of care.

TRANSFER WITHIN THE HOSPITAL

When a patient is transferred within the hospital, personal belongings must be moved to the new room. Every effort must be made to ensure that belongings are not misplaced or lost. The patient’s records are moved to the new unit or made available electronically. Other hospital departments (e.g., dietary, pharmacy, physical therapy) must be notified of the transfer.

When a patient is transferred to another unit, the nurse in the original area gives a verbal report about the patient to the nurse in the new area using the approved handoff technique. The report should include the patient’s name, age, providers, admitting diagnosis, surgical procedure (if applicable), current condition and manifestations, allergies, medications and treatments, laboratory data, and any special equipment that will be needed to provide care. Patient goals and nursing care priorities are identified, and the existence of advance directives is noted. Accurate, concise, and

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

complete verbal communication is essential.

TRANSFER TO AN EXTENDED CARE FACILITY

When a patient is transferred from the hospital to an extended care facility or other community setting, the patient is discharged from the hospital and a copy of the medical record may be sent to the extended care facility (depending on the provider's preference and the facility's protocol). The original record, which is a legal document, remains at the hospital. All of the patient's belongings are sent to the facility with the patient. Prescriptions and appointment cards for return visits to the provider's office may also be sent.

In most instances, a detailed assessment and care plan is sent from the hospital to the extended care facility. In addition, the nurse at the hospital often provides a verbal report to the nurse at the new facility using the approved handoff technique.

Remember **Jeff Hart**, the 9-year-old boy transferred from the state facility to the hospital because of respiratory complications. Once the child's problems have been resolved, the nurse will prepare Jeff to be transferred back to the state facility. Information about the events of the hospitalization will be documented and reported. Communication between health care team members at the hospital and those at the state facility helps ensure continuity of care for Jeff.

Discharge from a Health Care Setting

Patients are discharged from a health care facility when the expected outcomes of care are met and the patient or caregiver has the necessary knowledge and skills to provide any additional care still needed. In meeting the needs of the patient being discharged from a health care setting, the nurse considers that the person may be expecting a change from a dependent role to a more independent (self-care) role. Although discharge is almost always a welcome event, it also can be stressful.

DISCHARGE PLANNING

The purpose of planning for continuity of care, commonly referred to in hospitals and community facilities as **discharge planning**, is to ensure that patient and family needs are consistently met as the patient moves from a care setting to home. Essential components of discharge planning include assessing the strengths and limitations of the patient, the family or support person, and the environment; implementing and coordinating the care plan; considering individual, family, and community resources; and evaluating the effectiveness of care. Done well, discharge planning and teaching go a long way to reducing hospital readmissions.

Planning for discharge actually begins on admission, when information about the patient is collected and documented. The key to successful discharge planning is an exchange of information among the patient, the caregivers, and those responsible for care while the patient is in a care setting and after the patient returns home. This coordination of care is usually the nurse's responsibility.

With earlier hospital discharges, patients often are still acutely ill when they go home, and many require complicated treatment and care by family members. It is no longer unusual for family members to change sterile dressings, administer tube feedings, monitor intravenous medications, manage high-technology equipment, give complete physical care, and prepare special diets. If they are unprepared or unable to carry out these interventions correctly, the patient may experience an exacerbation of the illness or complications that could require readmission or additional treatment. The nurse must ensure that family members are taught the necessary knowledge and skills, and that referrals are made to facilities such as home health care or social services to provide support and assistance during the recovery period.

The hospital discharge process includes identifying which patients need which level of discharge planning. All patients need discharge planning in general, but certain patients have more comprehensive needs for specific services. The nurse who conducts the initial nursing assessment is in the best position to determine these special needs.

Patients who meet any of the following criteria need a formal discharge plan and referral to another facility:

- Lack of knowledge of the treatment plan
- Social isolation

- Recently diagnosed chronic disease
- Major surgery
- Prolonged recuperation from major surgery or illness
- Emotional or mental instability
- Complex home care regimen
- Financial difficulties
- Lack of available or appropriate referral sources
- Terminal illness

GUIDELINES FOR DISCHARGE PLANNING

For a patient hospitalized with a serious illness or injury, discharge planning may be done over time; for a patient treated in an ambulatory facility, it may be completed relatively quickly. A nursing case manager or discharge planner is often responsible for discharge planning for patients in acute care settings and may follow a care plan or a critical path established for the patient. Regardless of the plan used, the nurse assesses the patient's needs and identifies problems, develops goals with the patient, carries out teaching, and makes referrals. An example of discharge planning is provided in Box 12-4.

Assessing and Identifying Health Care Needs

The first step in discharge planning involves collecting and organizing data about the patient. When assessing the patient for discharge, the nurse includes the family, if possible, because both the patient and family must be actively involved for an effective transition from the health care setting to home. Factors to assess in discharge planning are listed in the accompanying Focused Assessment Guide 12-1 (on page 326). Other assessment formats may be used, depending on institutional procedures, to evaluate the patient's ability to carry out activities of daily living (e.g., bathing, dressing, toileting, transferring, continence, feeding) and instrumental activities of daily living (using the telephone, shopping, preparing food, doing housekeeping and laundry, taking medications, accessing transportation). The medical record and health care provider orders are also consulted for the exact medication and treatment plan before the nursing care plan is developed.

Box 12-4 Discharge Planning Example

Scenario

Mr. Smith is a 55-year-old married man, admitted to the hospital with a diagnosis of stroke. He now has left-side weakness and difficulty communicating verbally. He has had a history of high blood pressure for 10 years. If his blood pressure remains stable, Mr. Smith is to be discharged from the hospital in 3 days. He will be going home with four new medications. A low-sodium diet is prescribed.

After reviewing the medical record, the nurse interviews Mr. and Mrs. Smith. The assessment reveals that Mr. Smith has a limited ability to transfer from bed to chair. Both Mr. and Mrs. Smith are fearful of discharge. Mr. Smith believes that he will be able to return to work as an accountant in 3 weeks and hates the thought of becoming disabled at his age, but Mrs. Smith thinks he will never work again. They have never faced a life-threatening or disabling illness in the past. They have no strong cultural preferences for diet. They have two adult children who live out of state with their own families. Mrs. Smith has a younger sister who lives nearby. The Smiths are both college educated. They live in a suburban area in a two-story home with narrow stairs leading to the second floor's two bathrooms and three bedrooms. Their doctor's office is about 1 mile away, and shopping is nearby.

Mrs. Smith is worried about moving Mr. Smith in and out of bed. She needs instruction in the new medications and diet regimen. She is terrified that she may be unable to handle an emergency in the middle of the night. Financially, this two-income family has abruptly become a one-income family. Mr. Smith is not 65 years old and thus is not yet eligible for Medicare, although he does have disability insurance that will cover a portion of his salary.

Planning

How would the nurse coordinate this discharge plan? The health care provider or advance practice nurse must be consulted for diet, medication, other treatments, and home health care orders. The dietitian needs to counsel the Smiths on a low-sodium diet and on creative ways to prepare low-salt meals. Physical therapy has already been initiated at the hospital and will continue through home health care. An occupational therapist will visit to help the Smiths find the best way to tend to personal hygiene, grooming, and other meaningful life activities. The social worker has been called for financial assessment to determine exactly what services the Smiths can expect to have reimbursed by their insurance plan and how they will manage their out-of-pocket expenses.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

The nurse discusses Mr. and Mrs. Smith's health care needs with the home health care facility. A teaching plan for medications is implemented. The physical therapist teaches Mrs. Smith how to transfer Mr. Smith into and out of the bed and assures her that he will help her practice at home. Written information about high blood pressure, stroke, low-sodium diet, and prescribed medications is given to the Smiths, along with the telephone number of a local support group for people who have had strokes. Although Mrs. Smith still verbalizes concern about providing care at home, she says that she feels more in control now. Mr. Smith is beginning to realize that recovery may take longer than he anticipated. At the time of discharge, the nurse tells the Smiths that someone from the hospital will call them the next day and that the home health care nurse will visit them that afternoon.

Health problems, developed from the discharge planning assessment, identify the needs of both the patient and the family. The nurse determines whether problems are present now or are potential problems. For example, a patient with chronic respiratory problems may have assistance from a member of the family who has come to stay for 1 month, but after that, the patient will be alone at home. In this case, the situation is not an actual problem now but could become one unless planning is done to meet needs when there is no longer a family caregiver.

Setting Goals With the Patient

The expected goals of the discharge plan are set mutually and must be realistic. If the patient is involved in establishing goals, the expected outcomes of the care plan are more likely to be met. The patient may fail to follow the plan if the goals are not mutually agreed on or are not based on a complete assessment of the patient's needs. For example, the nurse or another health care provider may do a thorough job of teaching a patient about a special diet, but the patient may not actually follow the diet after discharge because of being unable to afford the special food, being unable to get to the grocery store, or not having a refrigerator at home for food storage.

Teaching

The AHRQ (www.ahrq.gov) offers the following suggestions for establishing and maintaining rapport with patients during education sessions:

- Offer a warm greeting
- Establish eye contact
- Slow down
- Use plain, nonmedical words
- Limit content
- Use the teach-back technique
- Report key points
- Involve the patient, family, and significant others (with the patient's permission)
- Use visual displays to reinforce information

Important teaching topics about self-care at home must be covered before discharge. These topics include medications, procedures and treatments, diet, referrals, and health status.

The patient needs to understand the drug name, dosage, purpose, effects, times to be taken, and possible side effects. Information about medications should be given both verbally and in writing. Copies of the medication administration record are often given to the patient to use as a pattern for times and amounts of medications administered in the hospital. Patients often find it helpful when the nurse draws a clock face and writes the names of the medications in the correct time slots.

All steps of a procedure (e.g., dressing changes) should be demonstrated, practiced, and provided in writing. Some nurses make short videos to demonstrate complex procedures to patients for the patient to take home. The patient or caregiver should then perform the procedure or treatment in the presence of the nurse to demonstrate the ability to carry out the procedure. The caregiver should know the purpose of what is being done and how to get supplies.

Focused Assessment Guide 12-1

DISCHARGE PLANNING

Factors to Assess	Questions and Approaches
Health data	Establish a database that includes age, biologic sex, height and weight, medical diagnoses, past medical history, current health problems, surgery, and functional limitations (e.g., impaired sight or hearing, amputation, use of wheelchair or walker).
Personal data	Ask the patient: "What language do you prefer to use?" "How do you feel about being discharged? Do you have any special fears or concerns?" "What are your expectations for recovery?" "What do you do to help you cope with stress? Are these things helpful?"
Caregivers	Establish the caregiver's age, biologic sex, relationship to the patient, past experiences with

	this illness or treatment, values and beliefs, and cultural practices that might affect prescribed care. Ask the caregiver: "Do you live with the patient?" "What are your expectations about providing care at home?" "What are your fears about providing care at home?"
Environment	Assess the home, noting if there will be barriers to using prescribed assistive devices (e.g., wheelchairs or walkers); if the patient will be able to use bathroom facilities safely; and if hot water, heat, and room for supplies are available. See the home safety checklist in Chapter 28, Box 28-1. Assess the community, noting location (such as rural or urban), whether health care is available and accessible, whether transportation is available, and any known environmental hazards.
Financial and support resources	Discuss expenses of prescribed care, including dressing supplies, medications, equipment, and special foods. Discuss available resources, including Medicare and Medicaid, parish nursing, and meal services to the home. Discuss—especially if the patient will be living alone—support services and resources and how they can be accessed. Include friends, church groups, and support groups specific to the patient's age and health care needs.

Teaching about diet should clearly describe the purpose of the diet and its expected outcomes. Patients find examples of written diet plans and meals helpful. If the patient has been in the hospital, it is helpful to save menu or meal forms to use as a reference at home.

Appointments for the first visit to a health care provider or facility are often made before discharge. In addition, the patient and family members should know how to contact the providers of follow-up care and should know whom to call if they have questions or problems. Nurses can help patients by making sure that they have the phone numbers of the primary care doctor and the names and phone numbers of community resources. Patients should also know the signs and symptoms of potential complications and when to contact emergency care. This referral information takes into account the patient's economic situation, access to transportation, support systems, and home environment.

All aspects of the illness or effects of treatment should be clearly described, both verbally and in written materials. Many forms of written information are available for patients, ranging from printed literature (e.g., from the American Heart Association) to teaching materials developed by the health care facility. Written instructions are given to the patient. Please note that handing the patient written instructions is NOT the same as teaching. The patient should be able to talk about the anticipated physical and emotional effects of the illness and also describe what will be done to achieve the highest level of health possible. All teaching should be documented in the patient's record and the discharge summary. The patient's or family member's demonstrations of care procedures must be satisfactory, and the patient and caregiver must have exposure to and practice with the equipment that they will be using at home.

Painter (2021) noted that managing home dialysis can be one of the most complex and challenging tasks family caregivers face. In her article on preventing home dialysis complications she offers a very practical guide to help nurses provide caregivers with the tools they need to manage their family member's health care at home.

Meeting Eligibility Requirements for Community-Based Settings

The physician or nurse practitioner must write an order for all home care services, and the patient must meet eligibility criteria for reimbursement for home health care visits. As much patient information as possible should be given to the home health facility, including the kind of surgery or injury, medications, the patient's physical and mental status, significant social factors (e.g., frail caregiver with health problems, or no caregiver), and the family's expected needs.

EVALUATING DISCHARGE PLANNING EFFECTIVENESS

Evaluating the discharge plan is crucial to ensure that the discharge planning works. Planning and referrals must be scrutinized to ensure the quality and appropriateness of services. Evaluation is ongoing, and care plans may need to be changed. A few weeks after the patient goes home, further evaluation of the discharge process is usually conducted by a telephone call, a questionnaire, or a home visit.

"Baby Steps to Discharge"

Nurses at Methodist Children's Hospital neonatal intensive care unit identified their unit's discharge as problematic for the nursing staff and patients' families. Research revealed that nurses were unsatisfied with the overall discharge process, the amount of time they had to teach parents, the number of times staff members stayed beyond their scheduled shifts to meet discharge needs, and whether discharge documentation was charted in the Baby Discharge Checklist section of the electronic health record. To address these problems, they developed a checklist to facilitate discharge better meeting the needs of their patients, families, and staff (Davidson, Roberts et al., 2020). See Figure 12-12 (on page 328), and be sure to check out the Baby Steps to Home website at babystepstohome.com.

Leaving the Hospital Against Medical Advice

A patient sometimes decides to leave the hospital or other care setting against medical advice (AMA). Although the patient is legally free to do so, this choice carries a risk for increased illness or complications. Torrey (2020) offers the following advice to patients who choose to leave AMA:

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

- **If you want to leave, you most likely can**. The only exception may be mental health patients for whom a discharge may place them or others at risk of harm.
- **AMA discharges do not void the terms of your insurance**. Doing so will not result in a refusal of payments or trigger an increase in premium. Be aware, however, that you will incur additional medical expenses if you have to be readmitted as a result of the premature discharge.
- **You will be asked to sign discharge papers**. This document is separate from any SRE complaint you may have filed. The discharge papers state that you have decided to leave against your doctor's advice. Have an advocate on hand to review the document and help you understand the terms.
- **You do not have to sign the papers**. You have the legal right to leave and there is no law requiring you to sign discharge documents. With that being said, you should prepare a letter explaining why you have decided to leave. Keep a copy of the letter for yourself and give a copy to the hospital administrator.

Telehealth

Telehealth.hhs.gov defines **telehealth**, sometimes called telemedicine, as:

> the use of electronic information and telecommunication technologies to provide care when you and the doctor aren't in the same place at the same time. If you have a phone or a device with internet access, you already have everything you need to get medical care or services through telehealth—you may be able to:
> - Talk to your doctor live over the phone or video chat.
> - Send and receive messages from your doctor using chat messaging, email, secure messaging, and secure file exchange.
> - Use remote patient monitoring so your doctor can check on you at home. For example, you might use a device to gather ECG or other vitals to help your doctor stay informed on your progress.

Types of care you can get using telehealth include general health care like wellness visits; prescriptions for medicine; dermatologic; eye exams; nutrition counseling; mental health counseling; and urgent care conditions such as sinusitis, back pain, urinary tract conditions, common rashes, etc. Some of the reasons why virtual visits are growing in popularity include:

- Limiting physical contact reduces everyone's exposure to COVID-19.
- Visiting virtually can address health issues wherever patients are, even from the comfort of home.
- Staying put cuts down on commuting, travel in bad weather, time off from work, and the need for child care.
- Using virtual health care tools can shorten wait times to see a provider and expand the range of access to specialists who live further away. (See https://telehealth.hhs.gov/patients/understanding-telehealth/#what-does-telehealth-mean.)

During the COVID-19 pandemic, many individuals chose to use telehealth visits rather than in-person doctor appointments for routine visits. Marsa (2020) reported that virtual doctor visits skyrocketed by 300% among Medicare-eligible seniors since the start of the pandemic and that nearly half of those surveyed were comfortable using telemedicine in the future. Some of the barriers that previously impeded the widespread adoption of home-based diagnostics and telemedicine in the past were removed by emergency rules during the pandemic. Physicians were allowed to practice across state lines; be reimbursed for in-home telemedicine and audio (phone) visits; and use FaceTime, Skype, or Zoom to communicate with their patients, which had long been considered taboo because of privacy issues. Check out the AARP website for a discussion of the pros and cons of telemedicine (Marsa, 2020) and Olsen (2020) for tips about how to use a smartphone, tablet, or computer for telehealth appointments. Be sure you are prepared to answer your patients' questions about telehealth knowledgeably.

Milestone	Done	Action	Criteria	Date/Initial	Entered into Baby Discharge Checklist (under Assessments) in EMR
24 Hrs of life (>2kg at Birth)	☐	Hep B	Signed consent form, info sheet given Infant >2 kg at birth Infants born <2 kg at birth get Hep B at 30 days of life		☐
24–48 Hrs of life	☐	Newborn Screen #1 (PKU) Form#:	All neonates 24–48 hours of life		☐
	☐	CCHD Screening (≥34 weeks, regardless of respiratory support)	For infants ≥34 weeks, perform CCHD screen at 24–48 hrs of life (regardless of respiratory support) Unless an ECHO is performed)		☐
1–2 wks of life	☐	Newborn Screen #2 (PKU) Form#:	All neonates 1–2 weeks of life		☐
>1800 grams	☐	Wean to open crib	Progressive weight gain Stable temps on air control made at 28°C for 24 hours		N/A
PO Feed "A/B" at 50% for 24 hrs	☐	Infant Guided Feeding	≥ 32 weeks ≤ 2 LMP HFNC respiratory support On full enteral gavage feedings		N/A
>32 weeks CGA and thereafter	☐	Hearing Screen (Regardless of NGT)	Weaned to an open crib 32 weeks post conception One room air unless plan to D/C on O2 Off phototherapy May be prior to last 2 doses of abx or diuretics OR within the last 24 hrs of abx		☐
≥34 weeks, off respiratory support	☐	CCHD Screening (≥34 weeks, off respiratory support)	For infants ≥34 weeks, repeat screening when off respiratory support. Unless an ECHO was performed		☐
Immunizations	☐	2 month	Signed consent obtained		☐
	☐	4 month			☐
	☐	6 month			☐
	☐	Synagis	TOC.Synagis.com OR SynagisTOC.com		☐
34 Think, "Out the Door"					
Circumcision Requested **Y** or **N**	☐	Provider identified:	Signed consent form (in-house) Must void within 8 hrs post procedure Provide instruction regarding circ care		☐
Safe Sleep	☐	Safe Sleep Link Watched	≥34 weeks >1500 grams No respiratory distress No contraindications to sleeping supine https://nichd.nih.gov/sts/news/videos/Pages/default.aspx		☐
CPR	☐	CPR Kit Given	<34 weeks gestation at birth Infants d/c'd on apnea monitors AND/OR Cardiac/blood pressure meds/trachs OR MD Order		N/A
	☐	CPR Kit Watched			☐
Car Seat	☐	Car Seat Position Tolerance Test	<37 weeks gestation Specified high-risk criteria as defined by MD/NNP		☐
RX	☐	Medication Teaching	Medication teaching with return demo Rx copied by RN Filled Rx verified by 2 RNs		Record in Nursing Note Place in Maroon Chart
ROP	☐	ROP Follow-Up Screening	RN (with caregivers) schedules follow-up appointment		Record in NICU Discharge Instructions
Special Diets	☐	Dietary Teaching	All caregivers going home with EBM fortification or formulas		Record in NICU Discharge Instructions
WIC Recipients	☐	WIC form	Providers must sign WIC forms prior to D/C		☐
Follow-Up Appointments		Phone Number	Provider Name/Appointment		Record in NICU Discharge Instructions
Pediatrician	☐	( )			☐
Developmentalist	☐	( )			☐
	☐	( )			☐
	☐	( )			☐
	☐	( )			☐
	☐	( )			☐
Night before D/C	☐	Obtain Weight, Length & FOC	All infants must be discharged with recent Weight, Length and FOC measurements		Record in NICU Discharge Instructions
Footprint Sheet	☐	Verify Footprints page	If infant was born in-house, attach infant ID bracelet to Footprint Sheet, verify parental bracelet, and obtain mother's signature. If infant was a transfer, confirm parental identification with valid government ID.		Place a copy in Maroon chart, record driver's license number in Discharge instructions (if applicable).
Discharge Order Received	☐	Financial clearance obtained	All infants must be cleared by a financial counselor After hours admitting

HOME HEALTH CARE NURSING

This chapter would not be complete without addressing some of the particulars of home health care nursing, which is rapidly expanding for many reasons. The need for home health care services is increasing as the population ages. Because fewer people live in the same community as their parents, home health care providers may be needed to care for ill parents when children live far away. Because patients are discharged from hospitals earlier in their recovery, many need skilled professional care after they return home. In addition, people are more often choosing to die with comfort

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

and dignity in their own homes. Also, third-party payers (such as insurance companies and managed care organizations) try to reduce the escalating costs of health care through the use of managed care programs that include home health care.

Nurses provide home health care within a system that includes home health facilities, patients, referral sources, health care providers or other primary caregivers, reimbursement sources, and legal considerations. The system functions best when its members communicate, cooperate, and collaborate with each other.

Types of Home Health Care Facilities

There are several different types of public and private home health care facilities. All home health care facilities must meet uniform standards for licensing, certification, and accreditation by state facilities or federal programs (such as Medicare). Home care facilities differ in how they are organized and administered. Box 12-5 describes different types of home health care facilities.

Home health care facilities are either certified or not certified by Medicare. A facility must be certified by Medicare to receive reimbursement from Medicare for services. Facilities may not be certified by Medicare for many reasons: for example, home care facilities that do not provide skilled nursing care (e.g., services provided by an RN) cannot receive Medicare reimbursement. Medicare is the largest single payer of home care services. It provides payment for services through a prospective payment plan based on an "episode of care" (usually considered a 60-day period). All patients receiving home health care services must have an order from their primary health care provider.

Box 12-5 Types of Home Health Care Facilities

Official or public facilities: These facilities are operated by state or local governments and primarily financed by tax funds. Most offer home care and disease-prevention programs in the community.

Voluntary or private not-for-profit facilities: These facilities are supported by donations, endowments, charities (such as the United Way), and insurance reimbursements. They are governed by a board of directors, usually representing the community they serve.

Private, proprietary facilities: Most private, proprietary facilities are for-profit organizations governed by individual owners or national corporations. Their services are paid for through health care insurance or individual self-pay.

Institution-based facilities: These facilities operate under a parent organization, such as a hospital. The home care facility is governed by the institution, and most referrals for care come from within the institution.

Home health care services include high-technology pharmacy services, skilled professional services, custodial care, medical equipment services, hospice and respite services (discussed in Chapter 11), and community support services. Box 12-6 lists examples of these services.

Box 12-6 Examples of Home Health Care Services

High Technology Services

- Intravenous therapy
- Home uterine monitoring
- Ventilator management
- Chemotherapy

Skilled Professional and Paraprofessional Services

- Nursing care (provided by a licensed practical nurse, a registered nurse, a clinical nurse specialist, or a nurse practitioner)
- Home health care aides
- Personal care
- Physical therapy
- Occupational therapy
- Speech therapy
- Medical social work
- Respiratory therapy

Custodial Services

- Homemaking and housekeeping

- Hourly or shift coverage
- Live-in services
- Companionship

Home Medical Services

- Providing durable medical equipment such as beds, braces, canes, crutches, wheelchairs, commodes, and oxygen

Hospice Services

- Pain management
- Physician and nurse practitioner services
- Spiritual support
- Respite care
- Bereavement counseling

Community Support Services

- Meals on Wheels
- Transportation
- Friendly visitors
- Delivery services
- Emergency answering services

Depending on the facility and its geographic location, professional providers may include RNs, licensed practical/vocational nurses, nurse practitioners and clinical nurse specialists, home care aides, enterostomal therapists, mental health specialists, speech therapists, respiratory therapists, physical therapists, occupational therapists, social workers, dietitians, and a chaplain or spiritual care provider. Regardless of how many providers are involved, the responsibility for care coordination (also called case management) remains with the RN.

Patients and Family Caregivers

The patient in home health care is both the person receiving care and the person's family, who often are also the caregivers. When a patient enters the hospital, the family most often plays a minor role in actual care. Families and friends visit with the patient and sometimes stay overnight, but they are generally not involved in direct patient care. Hospital staff provide personal care for the patient and administer medications and treatments. After the patient is discharged, the responsibility for care is shifted to family caregivers, who may or may not be physically or mentally able to handle this responsibility.

Today's emphasis on home health care means that family caregivers have increased responsibilities. Patients are discharged "quicker and sicker." Chronically ill patients may need long-term care at home that may not be covered by Medicare, and changes in Medicare funding may mean that fewer home visits are covered. The financial burden of care is more than many families can afford, and home health care nurses must be alert for signs of such financial problems (e.g., no food in the refrigerator or kitchen cupboards). A referral for services such as Meals on Wheels may be necessary to provide adequate nutrition for the patient.

In addition to the financial burden, family members face the challenges of handling equipment, providing new types of care to loved ones, and dealing with unfamiliar and often terrifying sounds, odors, and substances. Most caregivers are women, and many of them are over age 65. Older women may themselves have health problems or may not have the physical strength or energy to care for their family members. The Family Caregiver Alliance: National Center on Caregiving "supports and sustains the important work of families nationwide caring for adult loved ones with chronic disabling health conditions." Make time to visit their website to become familiar with their resources so you can refer them to family caregivers (https://www.caregiver.org/). The Alliance offers a national telephone hotline, online resources, and printed publications which serve as a central source of information and assistance to family caregivers in every state. Even family members who are themselves nurses may find that providing care at home is very different from providing care in the hospital. The accompanying Through the Eyes of the Family Caregiver display describes one such experience. Carpenter and Gould (2020) offer a sample of what nurses can share with caregivers of family or others:

- Engage in self-compassion
- Practice gratitude
- Do something for yourself daily
- Ask for help
- Find a support group
- Seek professional help for yourself if needed
- Check out available resources

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

- Be realistic about expectations (p. 53)

The home health care nurse must identify the needs of the family and caregiver. The nurse assesses whether the patient and family understand and agree with the care plan and determines if the caregivers understand the instructions provided and are capable of providing care. The nurse can help the patient and family identify and use community resources to meet their needs. If a caregiver feels overwhelmed, the nurse can provide resources to relieve the stress. The nurse also supports family decisions about complex treatments or end-of-life care. The following questions may be used for discussion:

- What is most important to you?
- What do you want for your life and your family's?
- How do you want to spend the rest of your life?
- How is this technology supporting or not supporting what you want?

Referrals for Home Care

A referral source is a person who recommends home care services and supplies the home health care facility with details about the patient's needs. The referral source may be a nurse, health care provider, social worker, therapist, or discharge planner. The referral may be to a home health facility, a hospice, or a community resource. Families sometimes generate their own referrals by contacting a home care facility. If the facility believes the patient qualifies for services, the facility contacts the patient's provider and requests a referral for the patient.

Orders for Home Care

Home health care cannot begin without an order from a primary provider, nor can it proceed without the primary caregiver's approved treatment plan. This is a legal and reimbursement requirement. A nursing assessment visit to identify a patient's needs can be scheduled only after a referral is made and an initial set of primary caregiver's orders are received. At the nursing assessment visit, the nurse begins to formulate the care plan and sends it to the primary caregiver for review and approval. Box 12-7 identifies the data needed to create an effective home care plan. The primary caregiver's signature on the care plan authorizes the home care facility to provide services. The plan is reviewed as necessary, but at least once every 60 days.

Box 12-7 Data Required for an Effective Home Care Plan

- Mental status
- Types of services and equipment required
- Prognosis and rehabilitation potential
- Functional limitations
- Activities permitted
- Nutritional requirements
- Medications and treatments
- Safety measures to protect against injury
- Instructions for timely discharge

Through the Eyes of the Family Caregiver

"I'm so glad to have you home, but what do I do now?" (and this is just the first day….)

I am a nurse and have been a nurse for 30 years. I have a diploma in nursing, a baccalaureate in nursing, a master's in counseling, and a doctorate in nursing. I have taught others how to be nurses for more than 25 years. Nothing in all my educational and practice experiences prepared me to care for the complex needs of my husband, Jacque, when he had surgery 2 years ago. Following diagnosis of metastatic thyroid cancer, a large lower thoracic spinal cord tumor (which put pressure on the spinal nerves, causing leg weakness and bladder malfunction) and the thyroid gland were removed surgically, and steel rods were implanted almost the entire length of the spine. After 30 days in the hospital for diagnosis, surgery, and recovery, Jacque came home—unable to do more than move from the bed to a chair, and with a catheter in his bladder that was attached to a drainage bag.

Before he came home, I got a hospital bed with electric controls, a bedside commode, and a bedside table. I cleared out the family room furniture, got a friend to put the television up on a table (so it could be seen from the hospital bed), and thought I was all ready to give my husband expert care. The first challenge came when he got up in a chair to eat his dinner—we had no chairs with a high enough seat or a straight enough back to allow use of the bedside table. I ran up and down stairs to look at chairs, and finally decided the antique armchair in the living room would work, and it did. Now another problem—where to hang the catheter drainage bag? And how best to move so it didn't pull when he moved? And remember to empty the bag before he gets up!

I fixed a wonderful homecoming meal for this man I love, and he could only eat a few bites. Now back to bed and a new problem. He got out of the bed and into the chair just fine, but now he can't get out of the chair and into the bed because his legs are still so weak. What did I do wrong—it worked in the hospital. It took me 2 days to realize that I forgot to lower the bed height so Jacque wouldn't have to push up so hard to get his bottom on the bed.

Then, after finally literally hauling him back in bed, I realized that I did not know how to move him up in bed. The physical therapist had taught him how to get up in a chair, but not how to move himself up in bed (they always did it for him in the hospital). This is a 250-lb man we are talking about. I could turn him from side to side, but I couldn't physically move him up in bed and he couldn't stay where he was. After a lot of trials, we figured out that he could wiggle one side of his body at a time and slowly inch up in bed. Now, he was exhausted and in pain, and I felt totally incompetent. Thank goodness, the home health care nurse is coming to visit tomorrow.

If I felt this way, how must family members feel who know nothing about caring for someone who is sick or in pain? I have such respect for all those family members who provide such wonderful care and for the nurses who provide home care that calms the fears and answers the questions.

—Priscilla LeMone

Safety Considerations

As a nurse making the first home visit, you should evaluate safety issues beforehand and once in the home; this includes the safety of the patient and of family and professional caregivers (Marrelli & Rennell, 2020). Once you arrive in the patient's home, you will want to do a home safety assessment since hazards in the home are a major contributor to falls, poisonings, violence, fire, and other accidents. A fall resulting in a fractured hip, for example, is often the beginning of serious debilitation in a person with dementia who until then was otherwise healthy. Chapter 28 offers a detailed home safety checklist, which you can adapt to any home setting.

QSEN SAFETY

It is essential for nurses making home visits to cultivate the knowledge, skills, and attitudes that will enable them to minimize the risk of harm to patients and providers through both system effectiveness and individual performance.

Try to assess the safety of the neighborhood where the patient lives before your first visit. You may need to arrange the visit at a time when it is safe to be in the area, and you should always know the exact destination before arriving for the visit. In some unsafe areas, police or security officers may accompany nurses. Make sure your car is in good working order, and call ahead to let the patient know when to expect you. You should only carry a small amount of money, and you should not bring medications with you. Never leave electronics, a purse or wallet, cell phone, laptop, or other valuables out in the open. Other guidelines for safety include carrying a cell phone programmed with emergency numbers, making sure that someone from the facility knows your itinerary, and being continuously alert to the environment (Elliot, 2014). In rare situations where your best efforts to address unsafe environments are unsuccessful (patient who is receiving oxygen therapy persists in smoking, a family member is verbally abusive and threatening), be sure to seek guidance from you supervisor and know your facility protocols for refusing to put yourself in a hazardous situation. It is wise to review the *NIOSH hazard review: Occupational hazards in home healthcare* before starting home visits (https://www.cdc.gov/niosh/docs/2010-125/pdfs/2010-125.pdf?id=10.26616/NIOSHPUB2010125).

Infection Prevention

Trying to keep homebound patients, their family caregivers, and the community infection free is a central responsibility for home health nurses. Cleanliness in the home and handwashing are key to infection prevention. If you remember how challenging it was for you to master the principles of asepsis and infection control described in Chapter 25, you will be able to empathize with family caregivers who need to learn complicated procedures and how to handle wastes. Hand hygiene, personal protective equipment, and environmental cleaning are critical to breaking the chain of transmission in the home. Handwashing with soap and water or an alcohol-based handrub is the most important measure for preventing transmission. Teach family caregivers how to effectively wash their hands:

Before:

- Direct contact with a patient
- Performing invasive procedures
- Handling dressings or touching open wounds
- Preparing and administering medications
- Feeding a patient

After:

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

- Contact with blood, body fluids, broken skin or mucous membranes
- Contact with items known or considered to be contaminated
- Removal of gloves
- Use of toilet or wiping nose

Between:

- Performing procedures on the same patient in which soiling of the hands is likely (Embil et al., 2009).

The CDC offers numerous resources to stop the spread of germs at home, work, and school.

Box 12-8 **Eligibility Requirements for Medicare Reimbursement for Home Health Care Services**

All people with Medicare Part A and/or Part B who meet all of these conditions are covered:

- You must be under the care of a doctor, and you must be getting services under a care plan established and reviewed regularly by a doctor.
- You must need, and a doctor must certify that you need, one or more of these:
  - Intermittent skilled nursing care (other than just drawing blood)
  - Physical therapy, speech-language pathology, or continued occupational therapy services. These services are covered only when the services are specific, safe, and an effective treatment for your condition. The amount, frequency, and time period of the services need to be reasonable, and they need to be complex or only qualified therapists can do them safely and effectively. To be eligible, either: (1) your condition must be expected to improve in a reasonable and generally predictable period of time, or (2) you need a skilled therapist to safely and effectively make a maintenance program for your condition, or (3) you need a skilled therapist to safely and effectively do maintenance therapy for your condition
- The home health facility caring for you must be Medicare certified.
- You must be homebound, and a doctor must certify that you're homebound.

You're not eligible for the home health benefit if you need more than part-time or "intermittent" skilled nursing care.

You may leave home for medical treatment or short, infrequent absences for nonmedical reasons, like attending religious services. You can still get home health care if you attend adult day care.

Reimbursement Sources

A reimbursement source pays for home health care services. Although Medicare is the largest single source of reimbursement, services are also reimbursed by Medicaid, private insurance, patients or their families, and other public funding. The reimbursement source evaluates each care plan, and only interventions identified on the plan are approved for reimbursement.

Medicare pays the cost of the first 100 home visits following a hospital stay (Centers for Medicare & Medicaid Services, 2016). Medicare does not reimburse visits to support general health, health promotion, or socioeconomic needs. To be approved for Medicare reimbursement, the patient must meet the criteria listed in Box 12-8.

In addition, Medicare provides reimbursement only if the nurse teaches about a new or acute situation, assesses an acute change in the patient's condition, or performs a skilled procedure requiring the professional skill, knowledge, ability, and judgment of a licensed nurse. It is imperative to thoroughly document all nursing interventions with each home visit for reimbursement to occur.

Legal Considerations

Legal considerations in home care involve a variety of factors, including issues of privacy and confidentiality, the patient's access to health information, the patient's freedom from reasonable restraint, informed consent, and matters of negligence and malpractice. The same codes and standards that guide all other nurses also guide nurses providing care in the home. The ANA's *Home Health Nursing: Scope and Standards of Practice* (2014) is the basis for practice in the home. The standards address the nursing process, interdisciplinary collaboration, quality assurance, professional development, and research. Another source of guidance is the section on Patient Rights and Responsibilities in the National Association for Home Care & Hospice (NAHC) Code of Ethics. Home care facilities are required by federal law to address the concepts in the Bill of Rights with all home care patients in the initial visit. Box 12-9 provides a few examples from the Bill of Rights. Nurses can best avoid lawsuits by knowing standards of practice, providing care that is consistent with facility policies, and documenting all carefully and accurately.

Box 12-9 **Examples of Home Health Care Patient Rights**

Home health care patients have the right to:

- Be fully informed of all patient rights and responsibilities
- Appropriate and professional care relating to provider orders
- Choice of care providers
- Receive information necessary to give informed consent prior to the start of any procedure or treatment
- Refuse treatment within the confines of the law and to be informed of the consequences of their action
- Privacy
- Receive a timely response from the facility to their requests for service
- Reasonable continuity of care
- Be informed within reasonable time of anticipated termination of service or plans for transfer to another facility
- Voice grievances and suggest changes in service or staff without fear of restraint or discrimination

Source: These are part of a longer list of patient rights and responsibilities published by the National Association for Home Care & Hospice. *Code of ethics. Patient rights and responsibilities.* http://www.nahc.org/about/code-of-ethics

HOME VISITS

Home health care patients often feel frightened, in pain, and abandoned, and family members often feel nervous about their new roles as caregivers. The home health care nurse must keep these concerns and needs in mind when planning and carrying out care.

Pre-entry Phase of the Home Visit

In the referral process, the provider or discharge planner of a hospital contacts the home care facility and provides a brief medical history, along with indications for home health services. During this pre-entry phase, the referral nurse at the home care facility collects as much information as possible about the patient's diagnoses, surgical experience, socioeconomic status, and treatments ordered. This is called the pre-entry phase. Once assigned the case, the nurse reviews the information and calls the patient to schedule a visit. During this phone conversation, the nurse can determine whether the patient's caregiver can answer questions related to the patient's and family's needs and also learn about the patient's cognitive abilities, orientation, and caregiver status. This information is important to the nurse planning the first visit.

Concept Mastery Alert

In home health care services, a great deal is usually known about the patient prior to the first visit. The nurse begins the initial patient assessment by collecting patient data in the pre-entry phase.

Entry Phase of the Home Visit

The second phase of the visit is the entry phase. In the entry phase, the nurse develops rapport with the patient and family, makes assessments, determines health problems, establishes desired outcomes (along with the patient and family), plans and implements prescribed care, and provides teaching. The nurse must remember that they are a guest in the patient's home and are offering services that the patient may accept or reject. Important considerations include negotiating and honoring visit times, establishing a rapport with the patient and family, defining what nursing care will be provided, and teaching to promote independence in self-care.

The nurse must gain the trust of the patient and family, and must recognize and respect their values. Accepting the patient's living conditions is necessary, even when they differ from those of the nurse. The nurse must ask permission before using the patient's home for activities such as handwashing. The nurse might believe that the furniture in the patient's home or sick room needs to be rearranged to allow the use of equipment and to remove safety hazards, but the patient should give permission before any changes are made.

Nurses who provide home health care interventions do so based on an individualized care plan for each patient, based initially on identifying individualized health care needs. In identifying the patient's needs and determining the interventions, the nurse fulfills the roles discussed earlier in the chapter.

Identifying Needs and Determining Interventions

The ability to assess patients accurately is an important skill for home health care nurses. Most of the initial assessment takes place during the first home visit, although ongoing focused assessment occurs during subsequent visits. The nurse must be skilled not only in physical assessment but also in psychological, socioeconomic, environmental, spiritual, and cultural assessment. Skilled assessment allows the nurse to make appropriate diagnoses. In addition, the nurse must determine and provide culturally respectful care (see Chapter 5); although important for inpatients, this is even more important in the patient's home. Family caregivers must also be considered, taking into account the various roles that

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

each family member plays and how they contribute to the patient's health status. Specific interventions are based on the patient's needs, but controlling infection and teaching the patient and caregiver are part of all home visits.

Teaching the Patient and Caregivers

Because home health care is meant to be short term and intermittent, the nurse includes the family and friends in the teaching process so that they can learn how to care for the patient after the nurse's home care is no longer needed. The nurse designs and implements the teaching plan based on the patient's and caregiver's readiness to learn. It must be adapted to the patient's and caregiver's physical and emotional status, and it must be understandable and "doable."

Consider **Joey Marshall**, the infant discharged home after 7 months. Because of the complex technology associated with his care, and because his mother feels anxious and afraid, the nurse needs to provide the necessary teaching about his care, but in small sessions to avoid overwhelming the mother.

Teaching should identify both the positive outcomes of following instruction and the serious consequences of failing to do so. The nurse points out the major problem areas specific to care in the home, focusing on the information needed to keep the patient safe until the nurse's next home visit.

Documenting Care Given in the Home

Documenting care given in the home is mandated by regulatory and federal facilities (see Chapter 20). The nurse may document the visit on preprinted forms or checklists or may use a computer.

The documented care plan, the visit plan, and progress notes are routinely used by regulatory facilities and payer sources (e.g., private insurance or Medicare) to determine whether various state and federal regulations are being met and if payment is warranted. Figure 12-13 illustrates goals for a patient newly admitted to home hospice with related nursing measures and actions. The care plan establishes specific measurable goals and specifies a time frame for reaching the goals. The care plan accurately reflects the condition of the patient, the patient's functional limitations and safety needs, the need for skilled care, specific provider orders, anticipated progress, criteria for discharge, supplies needed, a visit schedule for all health care providers, and a list of support systems available.

The nurse writes (or types) progress notes to document each visit to the patient's home. These notes must accurately describe the patient's condition, the skilled care provided, the patient's response, the patient's progress toward discharge, and an ongoing plan for continued care. They also include the nurse's plan for the next visit. To meet reimbursement requirements, each progress note must indicate that the care provided requires the knowledge and skills of a professional nurse.

DEVELOPING CLINICAL REASONING AND CLINICAL JUDGMENT

. Interview a nurse employed in a hospital and a nurse employed by a home health care facility. How are their roles and responsibilities alike? How do they differ? Ask both what they believe about the fragmentation of care in their setting. How well are nurses working with their colleagues to coordinate care?
. Compare and contrast the needs of the following patients and their families:

- A 2-year-old admitted to an ambulatory surgery center for minor surgery
- A 34-year-old woman discharged home after treatment for a fractured arm in the ED
- A 50-year-old woman returning to a clinic to learn the results of her mammogram
- A 78-year-old man being transferred from the hospital to a long-term care facility

What care priorities are these patients and families likely to have? How can you best establish a partnership with these patients and families? How likely are today's health care providers to meet the holistic needs (physical, psychological, social, and spiritual) of these patients?

. Discuss with your fellow students what you would do in the following home health care situations:

- An 85-year-old patient cannot move by himself and refuses to eat. His 83-year-old wife tries to care for him, but she is under a great deal of stress and begins to cry when you enter their apartment.
- A 43-year-old woman is receiving home care after surgery to repair a herniated vertebral disc ("slipped disc"). When you arrive for the scheduled visit, you find that her speech is slurred, and she does not remember how much pain

medication she has taken.

- A 2-year-old has a malignant brain tumor. He is not expected to live more than 1 week and is receiving hospice care.

What knowledge, attitudes, and skills are required to successfully address these patients' needs?

. A 55-year-old man with end-stage lung cancer is discharged home with a referral to a visiting nurse facility. He is receiving oxygen therapy. When the first visiting nurse enters his home, she finds the patient smoking, oblivious to the dangers with the oxygen in the room. When the nurse explains her safety concerns, he states that he may as well just die now if he isn't able to smoke because smoking is the only pleasure he has left.

. How can continuity and care coordination be achieved for Jeff Hart, Laura Degas, and Joey Marshall? What community resources should competent community-based nurses be able to recommend? Are there any barriers to these families accessing these resources?

Visit Actions

- ☐ Mileage/Drive Time*
- ☐ Demographics
- ☐ Vital Signs*
- ☐ Physical Assessment*
- ☐ View/Edit POC
- ☐ Interventions/Goals*
- ☐ New Order
- ☐ Order Supplies
- ☐ Supplies Delivered
- ☐ Aide Care Plan

Goal Description:

Patient/Caregiver verbalizes understanding of anorexia/dehydration in terminal patient and caregiver demonstrates offering, but not forcing food/fluids to patient.

Pain will be managed at a level acceptable to the patient.

A nursing care plan will be established.

Patient/Caregiver will verbalize/demonstrate appropriate pain management.

Patient exhibits signs of symptom reduction or relief.

Medications will be managed appropriately as evidenced by steady symptom control.

Patient/Caregiver will verbalize/demonstrate compliance with medication regimen.

Patient/Caregiver will verbalize knowledge of signs and symptoms/ preventative measures/ response in the event of bleeding/hemorrhage.

Send to Physician YES

Read to Physician YES

Send to Facility NO

Nurse to assess medication response and instruct on schedule actions, purpose, side effects, compliance, and need to report side effects to staff.

Nurse to assess for bleeding/hemorrhage and take measures to control/manage.

Instruct on preventative measures/response.

1) Admit to hospice
2) HOV may accept orders from primary care physician/practitioner partners and/or on call group when needed
3) May add/adjust visit order frequency for the interdisciplinary team
4) Patient, primary caregiver, and/or facility staff may administer medications
5) Patient may transfer level of care and/or location as necessary and determined by team. Notify the attending practitioner of changes. If admitted to inpatient unit (IPU), may initiate IPU orders
6) May obtain chest x-ray or PPD (tuberculosis [TB] skin test) as indicated for TB screening
7) Follow wound care guidelines for red unbroken skin (stage 1) and/or minor wound care
8) Ventricular access device maintenance: follow Arizona home care policies for catheter type
9) May initiate O_2 at 2–4 L via NC continuously or PRN as indicated
10) Durable medical equipment (DME) as indicated for patient condition
11) May insert urinary catheter up to 18 Fr for relief of urinary retention or incontinence. May use lidocaine gel (2%) topical for discomfort during insertion. May replace for malfunction PRN
12) Urinary catheter care: irrigate with 30–50 cc sterile 0.9% NaCl PRN
13) May use facility bowel care regimen if applicable and if not, then use standard HOV home care bowel orders

FIGURE 12-13. Goals for a patient newly admitted to home hospice with related nursing measures and actions (*mandatory actions). (*Source:* Used with permission. Hospice of the Valley, Phoenix, AZ.)

PRACTICING FOR NCLEX

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

. A discharge nurse manager is preparing the plan for a patient returning home after receiving a kidney transplant. What actions will the nurse perform to ensure continuity of care? Select all that apply.

a. Conduct an admission health assessment
b. Evaluate the effectiveness of the current nursing care plan
c. Participate in transferring the patient to the postoperative care unit
d. Make referrals to appropriate facilities
e. Maintain records of patient satisfaction with services received
f. Assess the strengths and limitations of the patient and family

. A discharge nurse is evaluating patients and their families to determine the need referrals to other facilities after hospitalization. Which patients will the nurse recommend for these services? Select all that apply.

a. Older adult diagnosed with dementia in the hospital
b. Adult diagnosed with Parkinson disease
c. Adult woman receiving chemotherapy for breast cancer
d. Adolescent being discharged with a cast on his leg
e. New mother who delivered a healthy infant via a cesarean birth
f. Adult man diagnosed with end-stage cancer

. A home health nurse is scheduled to visit a patient recently discharged from the hospital with a new colostomy. During the entry phase of the home visit, what actions will the nurse perform? Select all that apply.

a. Collect information about the patient's diagnosis, surgery, and treatments
b. Call the patient to make initial contact and schedule a visit
c. Develop rapport with the patient and their family
d. Assess the patient to identify their needs
e. Assess the physical environment of the home
f. Evaluate safety issues including the neighborhood in which the patient lives

. A nurse and AP are planning to receive a patient who sustained a traumatic head injury in a motor vehicle accident. Which activity can the nurse safely delegate to the AP?

a. Collecting information for a health history
b. Performing a physical assessment
c. Contacting the health care provider for medical orders
d. Preparing the bed and collecting needed supplies

. A home care nurse is observing the patient's family member perform a wound irrigation and dressing change for a postoperative wound dehiscence containing purulent drainage. In which situation will the nurse provide additional education?

a. The family member places the old dressing in a separate bag at the bedside.
b. The patient takes an analgesic a half-hour prior to the dressing change.
c. The family member states they washed their hands an hour ago.
d. The patient returns to bed during the dressing change.

. A patient is being transferred from the intensive care unit (ICU) to a medical-surgical unit. What is the responsibility of the ICU nurse during the transfer of care?

a. Providing a verbal report to the nurse on the new unit
b. Giving a detailed written report to the unit secretary
c. Delegating the responsibility for providing information
d. Making a copy of the patient's medical record

. A nurse is reviewing the discharge plan with a patient who had major abdominal surgery. Which statement by the nurse is most appropriate?

a. "I'll bet you will be so glad to be home and sleep in your own bed."
b. "Tell me about your understanding of your recovery needs after discharge."
c. "Be sure to take your pain medications and change your dressing."
d. "You will just be fine! Please stop worrying."

. A nurse is caring for a patient who has been hospitalized for dehydration secondary to a urinary tract infection. The patient states, "I'm leaving. There are too many germs here, and I'll probably get sicker than when I came in." As this patient has capacity for decision making, which response is most consistent with the nurse's legal accountability?

a. "Only the primary health care provider can authorize your discharge from a hospital."

b. “Let me gather your belongings and prepare the discharge paperwork.”
c. “I will inform the health care provider that you want to leave and request a psychiatric consult.”
d. “Your choice carries risks for complications, so I must ask you to sign a release form.”

. A nurse is considering moving from the hospital setting to home health care. In speaking with other professionals, what qualities does the nurse find they should possess to be successful? Select all that apply.
a. Making accurate assessments
b. Researching new treatments for chronic diseases
c. Communicating effectively
d. Delegating tasks appropriately
e. Performing clinical skills effectively
f. Making independent decisions

. A nurse asks the AP to prepare the hospital room for a new ambulatory patient. Which aspect of the room will the nurse ask the AP to correct?
a. The bed linens are folded back.
b. A hospital gown is on the bed.
c. Equipment for taking vital signs is in the room.
d. The bed is in the highest position.

. A nurse on a medical-surgical unit is teaching a patient’s family about hospice care. How does the nurse best explain the focus of this care?
a. Hospice care focuses on symptom and pain relief.
b. Nutrition is provided orally or by tube to maintain intake.
c. Surgical procedures are performed when medically necessary.
d. Services are provided until the patient’s death.

. A visiting nurse is performing the initial assessment and plan for a patient who receives Medicare and was recently discharged from the acute care hospital. Before implementing the plan of care, what follow-up is required by the nurse?
a. Validating the patient’s consent for care
b. Obtaining the health care provider’s signature and approval
c. Determining how the patient will pay for services
d. Ensuring that a family member or friend can assist with implementation

. When transferring a patient from the operating room to the medical-surgical unit, a nurse uses the SBAR format for handoff communication. Place the components of the SBAR communication (Situation, Background, Assessment, and Recommendations) in their proper order.
a. This 20-year-old patient presented to the ER with right lower quadrant pain, fever, and an elevated WBC count.
b. The patient is postlaparoscopic appendectomy.
c. The patient may need pain medication in 30 minutes.
d. The patient is sleepy, but responsive; five small bandages on the abdomen are clean and dry.

ANSWERS WITH RATIONALES

. **b, d, f.** The primary roles of the discharge planner as patients move from acute to home care are evaluating the nursing plan for effectiveness of care, making referrals for patients, and assessing the strengths of patients and their families. The staff typically performs an admission health assessment and assists with patient transfers from the OR. In most facilities, maintaining records of patient satisfaction is the role of the public relations manager or office manager.

. **a, b, f.** The patients who are most likely to need a formal discharge plan or referral to another facility are those who are emotionally or mentally unstable (e.g., those with dementia), those who have recently diagnosed chronic disease (e.g., Parkinson disease), and those who have a terminal illness (e.g., end-stage cancer). Other candidates include patients who do not understand the treatment plan, are socially isolated, have had major surgery or illness, need a complex home care regimen, or lack financial services or referral sources.

. **c, d, e.** In the entry phase of the home visit, the nurse develops rapport with the patient and family, makes assessments, determines nursing diagnoses, establishes desired outcomes, plans and implements prescribed care, and provides teaching. In the pre-entry phase of the home visit, the nurse collects information about the patient’s diagnoses, surgical experience, socioeconomic status, and treatment orders. In the pre-entry phase, the nurse also gathers supplies needed, makes an initial phone contact with the patient to arrange for a visit, and assesses the patient’s neighborhood for safety issues.

. **d.** The nurse may delegate preparation of the bed and collection of needed supplies to assistive personnel but performs

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

the other activities listed.

. **c.** The nurse teaches the patient and family to effectively wash their hands before and after having direct contact with the patient, before performing invasive procedures, when handling dressing or touching open wounds, and when administering medications or feeding the patient. All other options are correct.

. **a.** The transferring (ICU) nurse gives a verbal report on the patient's condition and nursing care needs to the receiving nurse. This information should not be given to a unit secretary, nor can this be delegated to others. The medical record is transferred with the patient; a copy is not made for transfers within the agency.

. **b.** The purpose of discharge planning is to ensure for continuity of care for the patient and family needs. The nurse uses open-ended assessment questions to begin a planning session. Essential components of discharge planning include assessing the strengths and limitations of the patient, the family or support person, and the environment; implementing and coordinating the care plan; considering individual, family, and community resources; and evaluating the effectiveness of care. Answers a and c are examples of communication or interventions, which may be included after an assessment. The statement "You will just be fine! Please stop worrying." is a cliché and is avoided.

. **d.** The patient is legally free to leave the hospital against medical advice (AMA); however, patients who leave AMA must sign a form releasing the health care provider and hospital from legal responsibility for their health status. This signed form becomes part of the medical record.

. **a, c, e, f.** Nurses working in the community must have the knowledge and skills to make accurate assessments, work independently, communicate effectively, and perform clinical skills accurately. Community-based nurses may be researchers and occasionally delegate care, but these are not key qualities for this type of nursing.

. **d.** A properly prepared hospital room includes a bed in the lowest position for an ambulatory patient, an open bed with top linens folded back, routine and special equipment and supplies assembled, and the physical environment of the room adjusted.

. **a.** Hospice services include pain management, physician and nurse practitioner services, spiritual support, respite services, and bereavement counseling.

. **b.** The nurse assesses the patient eligible for home services and presents the plan to the health care provider for approval. This approval the plan allows for provision of care and reimbursement of services.

. **b, a, c, d.** The SBAR communication for this patient should be: The patient is post laparoscopic appendectomy. This 20-year-old patient presented to the ER with right lower quadrant pain, fever, and an elevated WBC count. The patient may need pain medication in 30 minutes. The patient is sleepy, but responsive; there are five small bandages on the abdomen that are clean and dry.

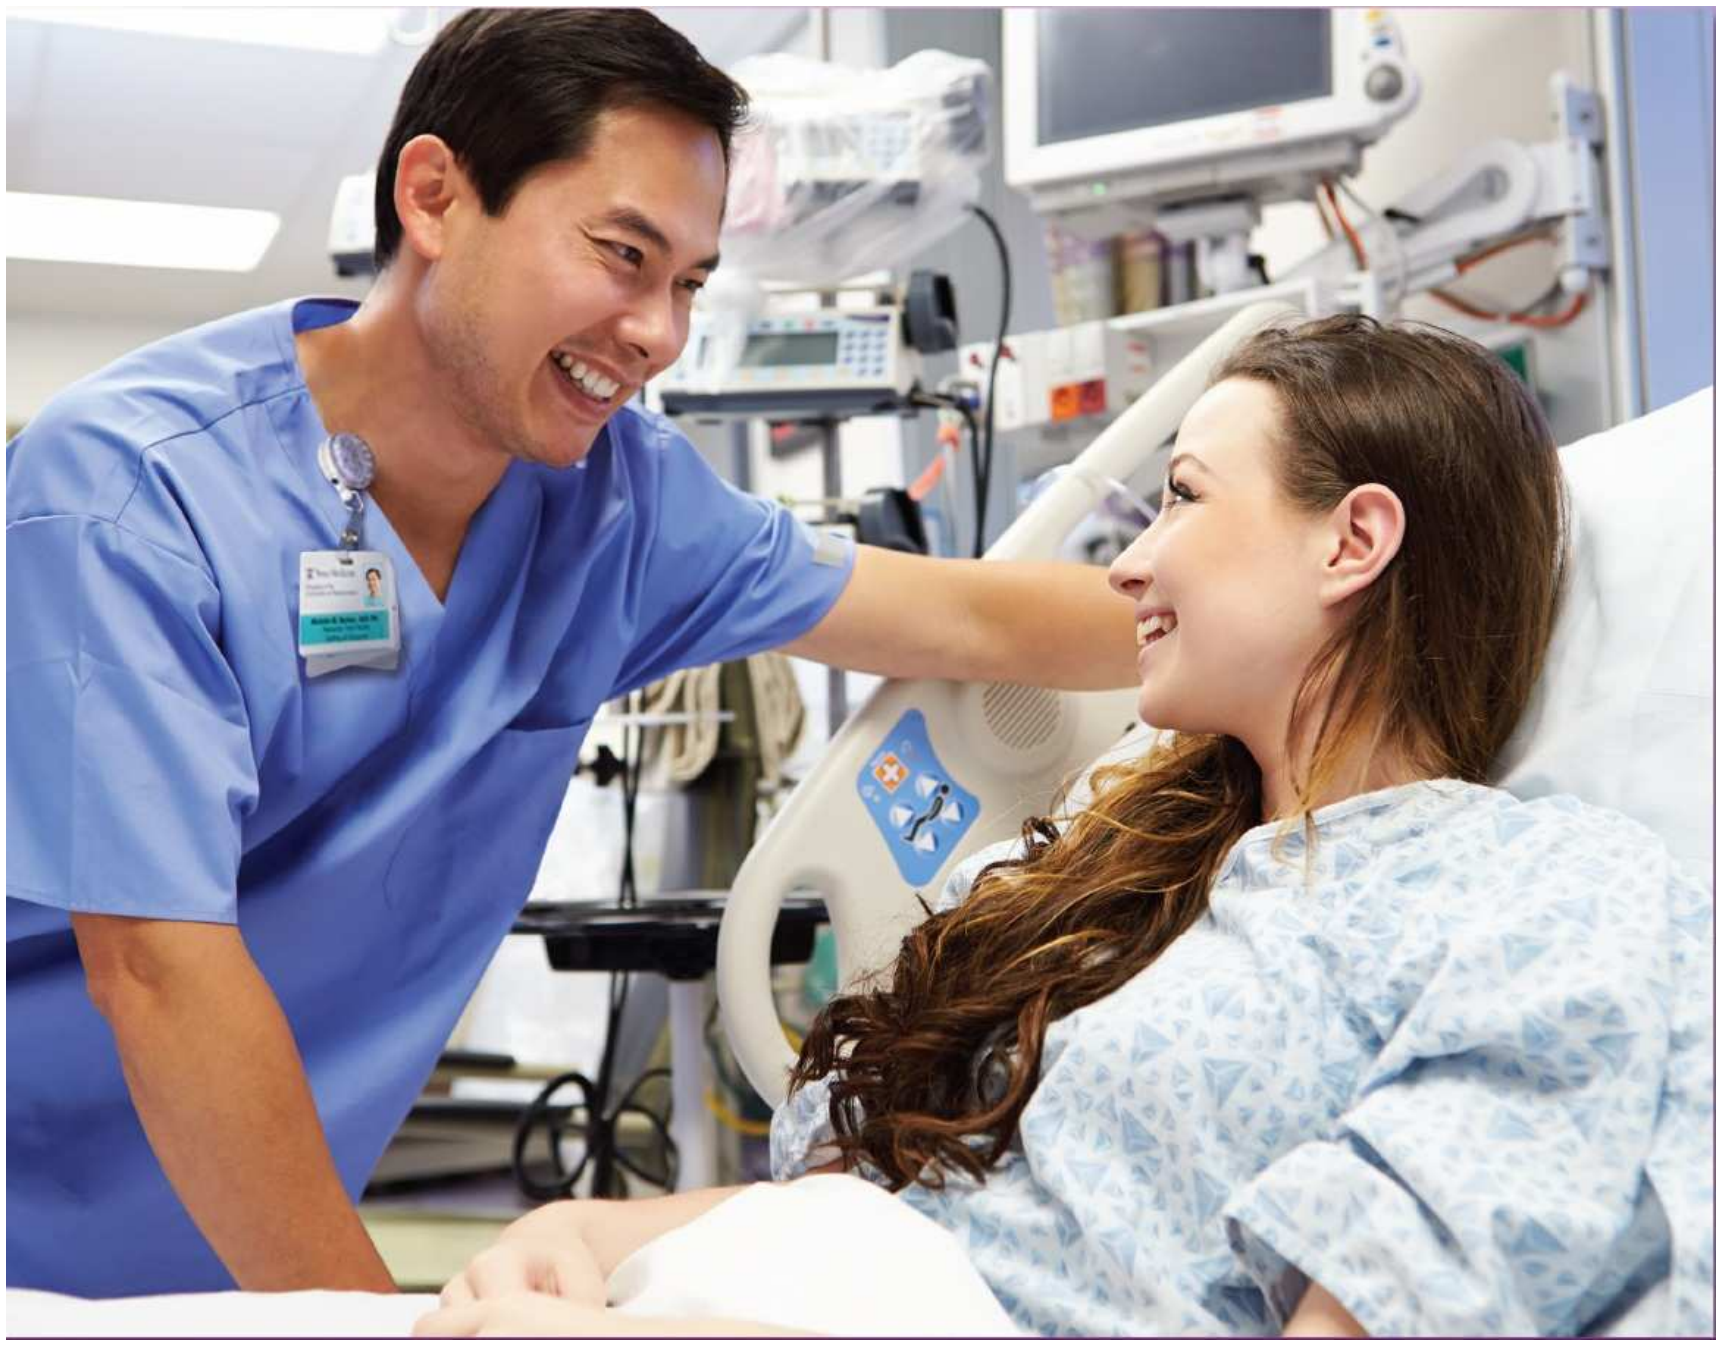
UNIT II Processes of Thoughtful, Person-Centered Practice

Unit III begins with an exploration of each element of thoughtful, person-centered practice. Chapter 13 invites you to reflect on your readiness for professional practice. Is your motivation love of humanity and the sincere desire to help people who need nursing care? Do you have the personal attributes, knowledge base, and competencies to begin safe practice? Are you committed to learn how to reason clinically, to make clinical judgments and decisions about treatment and care? This chapter introduces the three major clinical judgment models: Nursing Process (ADPIE), Tanner/Lasatar, and the National Council of State Boards of Nursing (NCSBN) Clinical Judgment Action Model. It also describes the blended and QSEN competencies nurses need to use the process for promoting patient well-being. Chapter 14, a brand-new chapter in this edition, demonstrates how the NCSBN Clinical Judgment Action Model informs and enhances professional practice. Chapters 15 to 19 explore each step of the nursing process (Assessing, Diagnosing/Problem Identification, Outcome Identification and Planning, Implementing, and Evaluating). Chapter 20 introduces you to the critical skill of documenting your nursing work and reporting to other members of the team. The unit concludes with Chapter 21, which focuses on informatics and technology.



The phases of clinical judgment models are not separate items but rather parts of a whole, used to identify patient problems and needs, establish priorities of care, maximize strengths, and resolve actual or potential alterations in human responses to health and illness, thereby promoting health to the highest level possible for each patient. The phases are iterative, which means they are interrelated and repetitive.

Assessment, the systematic and continuous collection and communication of data, allows analysis of data to identify patient problems and strengths. During outcome identification and planning, the nurse and patient mutually identify expected outcomes and agree on nursing interventions necessary to meet these outcomes. The nurse implements the plan of care, adapting it to each person, documenting nursing actions and patient responses. After implementation, the nurse and patient evaluate the effectiveness of the plan based on achievement of outcomes and determine if the plan should be continued, modified, or terminated.

The nursing process is nursing practice in action. Unit III provides the information necessary to begin to apply the nursing process. As blended competencies are learned and practiced, the process becomes an integral component of each nurse–patient interaction. The outcome is thoughtful, person-centered practice.

> **"… the nursing process is educative and therapeutic when nurse and patient can come to know and to respect each other, as persons who are alike, and yet different, as persons who share in the solution of problems."**
>
> Hildegard Peplau (1909–1999) *was an active participant in ANA and NLN and a leader in recognizing the significance of interpersonal relationships in psychiatric nursing. Her landmark book integrated theory into her model at a time when nursing theory was in its infancy.*

Blended Competencies, Clinical Reasoning, and Processes of Person-Centered Care

Charlotte Horvath

Charlotte is a single mother whose 5-year-old daughter will be discharged soon. Charlotte is to learn how to perform wound care for her daughter at home. However, she has missed every planned teaching session thus far.

Addie Warner

Addie is an older adult woman who has suffered a cerebrovascular accident (CVA). She is currently being cared for in a neurologic step-down unit. The patient frequently uses her call light and is called “demanding” by some staff.

Jermaine Byrd

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Jermaine is a 58-year-old man who has just returned to the medical-surgical unit after undergoing vascular surgery on the femoral artery. Orders include assessing the distal pulses to ensure adequate blood flow. However, the nurse assessing Jermaine is unable to palpate the posterior tibial pulse.

Learning Outcomes

After completing the chapter, you will be able to accomplish the following:

. Describe each element of thoughtful, person-centered practice: the nurse's personal attributes, knowledge base, and blended and QSEN competencies; clinical reasoning, judgment, and decision making; person-centered nursing process; and reflective practice leading to personal learning.
. Assess your capacity for competent, responsible, caring practice.
. Describe three models of caring.
. Contrast three approaches to problem solving.
. Use the clinical reasoning model.
. Compare three common clinical judgment models.
. Describe the historic evolution of the nursing process.
. Describe the nursing process and each of its five phases.
. List five characteristics of the nursing process.
. List three patient benefits and three nursing benefits of using the nursing process correctly.
. Identify personal strengths and weaknesses in light of nursing's essential knowledge, attitudes, and skills.
. Describe the steps in concept mapping care planning.
. Value reflective practice as an aid to self-improvement.

trial-and-error problem solving

Traditionally, nurses prided themselves on comforting those who were ill and executing with precision such tasks as dressing wounds, administering medications, and bathing, feeding, and ambulating patients. Physicians ordered many of these tasks, and few nurses in the past would have characterized their work as being independent, evidence based, or creative.

But as society and health care delivery change, so does nursing. Nurses now work with healthy and ill patients in both institutional and community settings. In addition to their role as caregivers, nurses fill specialized roles as care managers/coordinators, safety and quality officers, teachers, counselors, advocates, and researchers. Nurses are responsible for a unique dimension of health care: "the diagnosis and treatment of human responses to actual or potential health problems" (American Nurses Association [ANA], 2010). The most recent ANA definition of nursing is:

> Nursing integrates the art and science of caring and focuses on the protection, promotion, and optimization of health and human functioning; prevention of illness and injury; facilitation of healing; and alleviation of suffering through compassionate presence. Nursing is the diagnosis and treatment of human responses and advocacy in the care of individuals, families, groups, communities and populations in recognition of the connection of all humanity. (2021, p. 1)

In this capacity, nurses are knowledgeable, competent, and independent professionals who work collaboratively with other health care professionals to design and deliver thoughtful, person-centered care. As the role of nursing changed, definitions of nursing evolved to acknowledge essential features of professional nursing:

- Provision of a caring relationship that facilitates health and healing
- Attention to the range of human experiences and responses to health and illness within the patient's physical and social environments
- Integration of assessment data with knowledge gained from an appreciation of the patient's or group's subjective experience
- Application of scientific knowledge to the processes of diagnosis and treatment through the use of judgment and critical thinking
- Advancement of professional nursing knowledge through scholarly inquiry
- Influence on social and public policy to promote social justice
- Assurance of safe, quality, and evidence-based practice (ANA, 2010)

Who nurses choose to be every time they show up for practice literally has the power to influence and in some cases to determine how people are born, live, age, suffer, and die. For this reason, this text promotes thoughtful, person-centered practice. In this chapter, you will learn what it takes to be a competent, responsible, and compassionately caring professional nurse. Committed nurses earn the public's trust every day.

THOUGHTFUL PRACTICE

Thoughtful practice is nursing practice that is considerate and compassionate. A thoughtful nurse always keeps the person at the center of caregiving in order to promote the humanity, dignity, and well-being of the patient. Thoughtful nurses value their own integrity and development, reflecting on each day's practice to better understand and learn from each day's challenges. They seek to establish powerful partnerships with patients and to deliver care through processes that are holistic and tailored to meet the individual needs of patients. Thoughtful nurses base care decisions on sound clinical reasoning and judgments that they evaluate and review through reflective practice, so that they continually learn from practice for the benefit of future patients (Hill et al., 2017, p. 240).

QSEN Reflective Practice: Cultivating QSEN Competencies

CHALLENGE TO ETHICAL AND LEGAL SKILLS

Recently, I spent time working as a pediatric nurse technician. My job was to provide basic care to patients, such as giving bed baths, assisting with meals, and changing linens. One of the nicest parts of my job was that I was able to spend more time than most nurses are able to, talking with my patients and getting to know them, and hopefully making a positive difference in their days. One day I was assigned to float to the neurologic step-down unit. Here, I met Addie Warner, an older woman who had suffered a cerebrovascular accident (CVA). Because of what happened that day, I became responsible for her care for the rest of the day.

When I arrived on the unit that morning, a nurse told me what a "pain" Mrs. Warner was, describing how she kept demanding that the nurse come into her room and help her with this or that. They told me I

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

should “ignore her,” and they told me that I didn’t need to listen to her. I was immediately appalled. I witnessed yet another nurse stand outside her door and condescendingly tell her in an annoyed voice, “I’ll be with you when I have time.” As I passed her room, Ms. Warner yelled out for attention.

Thinking Outside the Box: Possible Courses of Action

- Listen to all the nurses out of personal ignorance, out of fear for being reprimanded by them, or out of selfishness, and continue to ignore this patient and her needs just like everyone else was doing.
- Ask one of the nurses to go into the room with me to determine what the patient’s needs were and to help me meet them, despite the nurses’ obvious dislike of the patient and obvious lack of desire to help her.
- Go into the patient’s room by myself, assess her needs for the simple purpose of relaying them to the nurse, and then not do anything to meet any of her needs myself.
- Enter the patient’s room by myself, assess her needs, assure her that I would try to help her meet her needs once the nurse became available, and then drop the ball in the end, not helping her much myself or with the nurse.
- Go into her room by myself, assess her needs, assure her that I would help her meet her needs, and take the steps to meet them later in the shift when I had more time.
- Proceed into her room by myself, assess her needs, assure her that I would help her meet them, and take the steps to meet them immediately and throughout the whole shift.
- Ignore the patient, stating that meeting her needs was not my job, but encourage the nurses to go into the room to assess and meet her needs.

Evaluating a Good Outcome: How Do I Define Success?

- The patient’s needs are assessed and met by the most compassionate and most qualified professional possible.
- The patient feels heard and respected.
- I feel respected, feeling that I used my professional patient-care skills to the best of my ability to facilitate resolution of the patient’s situation.
- The patient’s inherent dignity, worth, and uniqueness is respected by everyone who comes into contact with her.
- The patient remains the primary commitment for me and the nurses.
- The patient feels that she is the primary commitment for the nurse and me.
- The health, safety, and rights of the patient are promoted, advocated for, and protected.
- The integrity of my patient, myself, and my fellow nurses is preserved.

Personal Learning: Here’s to the Future!

Immediately upon starting my shift, I went into Ms. Warner’s room to see what the problem was. She told me, in tears, that she’s had to go to the bathroom for the past 2 hours, and that no one would help her. As a result, she ended up urinating on herself in bed. I immediately helped her out of bed into a chair, gave her soap and towels to start washing herself, and set about changing her linens. All the while, I listened to her talk about how humiliated and upset she was about having been forced to “wet the bed.” She also was upset that she’d ruined the only pair of underwear she had with her in the hospital. So, I washed the underwear in the sink for her. I asked her questions about what had happened that morning and validated her feelings. I helped her finish bathing, set her up to be sitting comfortably in the chair, and got her lunch tray, which I then set up for her. Although, for the most part, she could feed herself, her CVA had left her with some residual weakness, necessitating some help with opening containers, cutting foods, and placing items within her reach on the tray. She also wanted me to bring her the phone and help her dial, which I did. I let her eat and talk on the phone alone, promising I would come back to check on her soon.

Throughout the rest of the shift, I peeked my head into her room every half hour or so, eventually helping her back into her bed after she was comfortable, fed, and less upset. Probably the most important thing I did for her, besides resolving the wet bed situation, was to listen to her as she purged her feelings. I validated her feelings and did everything in my power to make sure that she experienced no further episodes of disrespect. Unfortunately, while the patient’s needs were met by the most compassionate professional possible (me), they were not met by the most qualified professional possible (the nurse). I believe that the patient did feel heard and respected after our interactions. However, she stated that she felt ignored after her interactions with the nurses and health care providers.

I felt that my actions were respected because none of the nurses gave me a difficult time or made fun of me for taking the extra time to soothe this patient. I did feel that I provided professional patient care to this patient in the best manner I knew. I respected her inherent dignity, worth, and uniqueness, and I

believe that the patient felt my primary commitment was to her. Unfortunately, this only highlighted the fact that no one else's primary commitment had been to her. I certainly promoted, advocated for, and strove to protect this patient's health, safety, and rights. However, it seemed that the nurses went out of their way not to do that for this patient.

Tracey Sara Miller, Georgetown University

QSEN SELF-REFLECTION ON QUALITY AND SAFETY COMPETENCIES DEVELOPING KNOWLEDGE, SKILLS, AND ATTITUDES FOR CONTINUOUS IMPROVEMENT

How do you think you would respond in a similar situation? Why? What does this tell you about yourself and about the adequacy of your skills for professional practice? What *knowledge, attitudes,* and *skills* do you need to develop to continuously improve the quality and safety of care for patients like Ms. Warner?

Person-Centered Care: Why do you believe that the nursing staff was so critical of this patient? What was it about the student's attitudes and responses to Ms. Warner that created such a successful partnership?

Teamwork and Collaboration: Do you think that the nursing student should have approached the nursing staff about what she found? How might a student or professional nurse effectively change negative staff behavior that is disrespectful of a patient's inherent dignity?

Safety/Evidence-Based Practice: What safety challenges resulted from the nursing staff's indifference and condescension, and how did the student correct these? What might the nursing research suggest as best practice in similar situations?

Informatics: Can you identify the essential information that must be available in Ms. Warner's electronic record to support safe patient care and coordination of care? Can you think of other ways to respond to or approach the situation?

Before reading further, take a minute to read the Reflective Practice display, review the concepts in Box 13-1, and consider the essential elements of thoughtful, person-centered care shown in Figure 13-1 on page 346.

Box 13-1 **Thoughtful, Person-Centered Practice**

Person

Each person is unique and has their own set of beliefs, values, memories, hopes, and history. People are holistic beings with emotional, physical, social, and spiritual dimensions and needs that all meld together to create the whole individual person. The fact that a person has a disease is only one aspect of the whole in the same way as having red hair is only one aspect of the whole person. Therefore, each person's health journey and personal care are individual. Clinical care is an interaction between the carer and the cared for. Each of the people within this relationship is unique, so the respect and valuing of the person applies to both. Relationships based on this principle can become therapeutic.

Professional Nurse

Professional nursing requires cultivated personal attributes, mastery of the science of nursing, and reflective clinical experience in which nurses develop the blended competencies and QSEN competencies that promote thoughtful and effective person-centered practice.

Reflective Practice Leading to Personal Learning

Reflective practice occurs when the carer has a profound awareness of self; awareness of one's own biases, prejudgments, prejudices, and assumptions; and understands how these may affect the therapeutic relationship. This awareness is developed through the process of reflection, thinking back on what has occurred for the purpose of learning in order to improve.

Clinical Reasoning, Judgment, and Decision Making

Clinical reasoning is the process for analyzing a situation, making a judgment, deciding on possible alternative reasons, and choosing an action to be taken. It is built on a foundation of knowledge, experience, and the personal attributes of the person doing the reasoning. Critical thinking is fundamental in the process of clinical reasoning. Care can become ritualistic and depersonalized when nurses fail in clinical reasoning and judgment.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Person-Centered Nursing Process

The nursing process describes the way in which care is organized through a series of actions undertaken in response to the individual needs of the patient. The components of the nursing process are assessing, diagnosing/problem identification, planning, implementing, and evaluating.

Nurse's Action in Response to Individual Clinical Need

The healing action that occurs in response to individual need completes the cycle of thoughtful practice when it is considered, personalized, appropriate, valued, and effective.

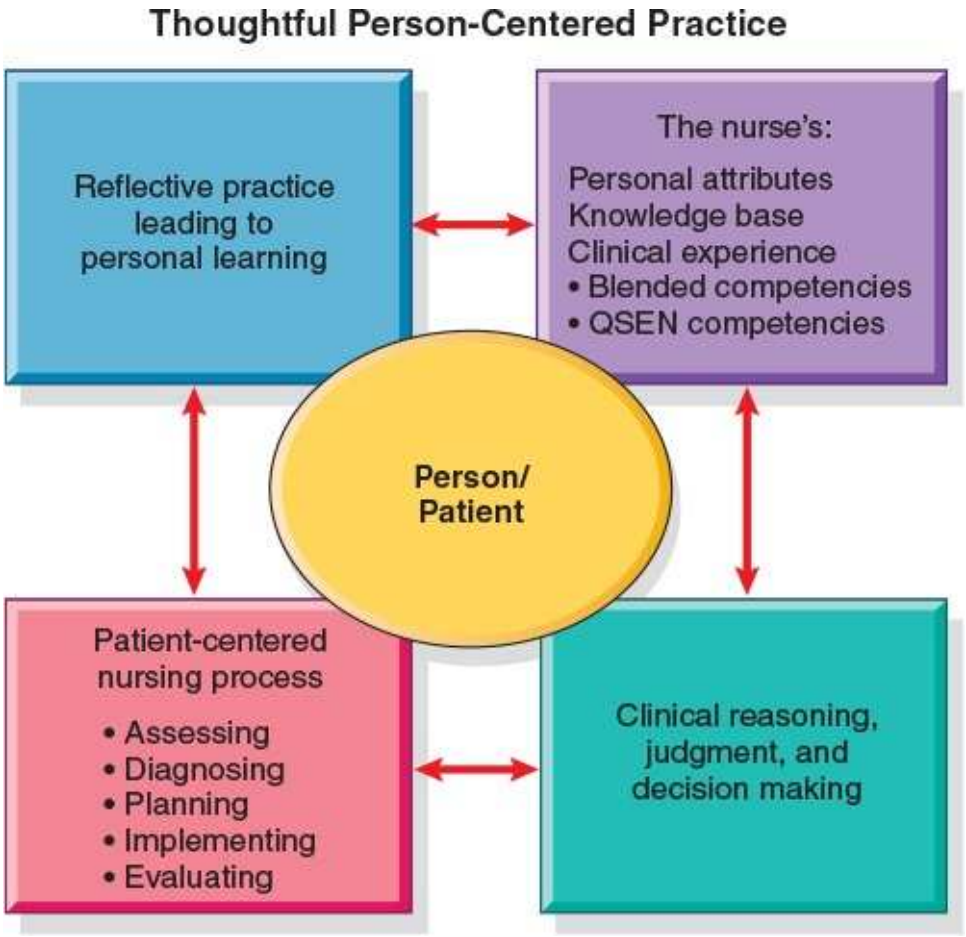

FIGURE 13-1. The components of thoughtful practice are all interrelated and function together to create thoughtful, person-centered care. (*Source:* Adapted from Hill, R., Hall, H., & Glew P. [2017]. *Fundamentals of nursing and midwifery: A person-centered approach to care* [3rd ed.]. Wolters Kluwer/Lippincott Williams & Wilkins. p. 240.)

THOUGHTFUL, PERSON-CENTERED PRACTICE

If you are new to health care, you probably can't imagine what health care would be like if it wasn't person centered. Sadly, U.S. health care in the 20th century focused more often on disease and on generating revenues than on patients. Despite major efforts to refocus the delivery of health care based on the needs of the patient, we are in danger of failing again. Physician Abraham Verghese (2011) coined the term *iPatient:*

> I've gotten into some trouble in Silicon Valley for saying that the patient in the bed has almost become an icon for the real patient who is in the computer. I've actually coined a term for that entity in the computer. I call it the *iPatient.* The iPatient is getting wonderful care all across America. The real patient often wonders, where is everyone? When are they going to come by and explain things to me? Who's in charge? There's a real disjunction between the patient's perception and our own perceptions … of the best medical care.

Nurses have always been on the frontlines of keeping care delivery focused on the needs of real patients in real time. But today's demanding work environments are forcing some nurses to focus more on accomplishing a set of tasks than on helping patients. From the very beginning of your professional practice, remember that nursing is about creating therapeutic relationships with actual patients, about making health care work for all who need it, especially the most vulnerable. Being a good nurse isn't just a matter of being "busy" doing "tasks"—it is about being and making the critical difference for patients and families with health care needs. Reflect for a moment on how you will respond when another nurse informs you that your patient is requesting medication for pain. How will your response differ if you have a *person* versus a *task* orientation? Hint: The nurse with a task orientation merely wants to safely administer and document the prescribed medication. The nurse with a person orientation uses every clinical encounter to assess how the person is doing and to communicate respect, compassion, and care.

The idea of **person-centered care** emerged about 30 years ago as a return to the holistic roots of health care. Promoters of this model of care included the Picker Institute, the Planetree membership network, and the 2001 Institute of Medicine's seminal report *Crossing the Quality Chasm.* (The Institute of Medicine has since been renamed the

National Academy of Sciences, Engineering, and Medicine.) With the introduction of the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) patient experience of care survey, there now exists a standardized tool to evaluate the way care is provided from the patient's perspective. Although there are different definitions of person-centered care, the 10 vital person-centered care principles listed in Box 13-2 offer a comprehensive illustration.

Theories of Caring

Nurses who practice thoughtful, person-centered care are committed to developing caring professional relationships based on respect and mutual trust. This holistic approach, which is consistent with theories based on human caring, seeks to promote humanism, health, and quality of living. Caring is viewed as universal and is practiced through interpersonal relationships. When the relationship between the caregiver and the person who is being cared for is focused on promoting or restoring the health and well-being of the person being cared for in the relationship or facilitating their dying with respect and comfort, it becomes a **therapeutic relationship** (Hill et al., 2017). Dossey and Dossey (1998) write:

> Our majestic predecessors in nursing, such as Florence Nightingale, spoke boldly about the need to honor the psychological and spiritual aspects of our patients. For her and many others, it was unthinkable to consider sick humans as mere bodies who could be treated in isolation from their minds and spirits. In Nightingale's holistic approach, the role of love and empathy was considered paramount.... But with the rise of scientific, materialistic medicine in the nineteenth and twentieth centuries, these lessons in love … were set aside and virtually lost.... In study after study, social contact, the richness of one's interactions with others, is correlated with positive health outcomes.... We're being asked to integrate a holistic approach and extend love, compassion, and empathy" (pp. 35–38).

Box 13-2 Reflective Practice: Thoughtful, Person-Centered Practice

1. All team members are considered caregivers.	• Identify the team members you worked with while implementing the plan of care. Everyone in the workforce from housekeeping staff to the CEO is part of the patient's care team. • Next to each describe what they contributed to person-centered care for your patient. • Star or highlight those with whom you had meaningful conversations and briefly describe what you learned.
2. Care is based on continuous healing relationships.	• Describe what you did to make your interactions with the patient/family qualify as a healing relationship versus a mere business transaction or provision of a service. • This principle reinforces a focus on the continuum of care. In what ways did your care anticipate and prepare your patient and family for the days ahead?
3. Care is customized and reflects patient needs, values, and choices.	• Describe what you learned about this patient/family as unique individuals (strengths, needs, values, and preferences) that allowed you to creatively individualize the care plan. • What strategies did you use to elicit the patient's needs, values, and choices? • In what specific ways is your care plan different from any standardized care plan?
4. Knowledge and information are freely shared between and among patients, care partners, health care providers, and caregivers.	• Describe one way you shared information with the patient/family and one way you shared information with the health care team that enhanced the partnership and the care plan. • What did you learn from other members of the team that enhanced your ability to care for this patient/family?
5. Care is provided in a healing environment of comfort, peace, and support.	• When we think of healing environment we usually think of music, healing gardens, soothing colors. Assess your patient's healing environment and describe what you did to facilitate the creation of such an environment. How can you adapt these principles in critical care settings, emergency

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

	rooms, clinics, etc.? • In what ways are you able to address variables that negatively influence healing: Poverty, noise, time pressures, etc. • What percentage of the care plan and *your* care plan addresses patient needs other than physiologic needs? • To what degree are the psycho-social-spiritual needs of the patients identified and addressed? To what degree do they appear in your care plan? • Describe the measures you used to promote the patient's/family's comfort and peace and to provide support.
6. Families and friends of the patient are considered an essential part of the care team.	• Has the patient identified family members or others they wish to be part of the care team? If the patient is not able to articulate preferences, is there a legally valid surrogate making decisions? In what ways have you communicated with these people and provided the information and support they need to help the patient?
7. Patient safety is a visible priority.	• What is the institutional commitment to safety measures such as hand hygiene and other protocols to prevent hospital-acquired infections, medication and other errors, falls, etc.? • In what ways is this particular patient at risk for safety concerns, falls, infection, violence, etc. and what have you done to address these risks?
8. Transparency is the rule in the care of the patient.	• True person-centered care requires transparency between providers and patients and among providers. Patients or their designees need information so they can make informed decisions. Does your patient have the information they need to make informed decisions? If not, in what ways are you addressing this?
9. All caregivers cooperate with one another through a common focus on the best interests and personal goals of the patient.	• In what ways are clinical decisions or institutional policies motivated by goals other than the best interests and personal goals of the patient and how is this constraining the care plan? What have you done to address these variables? • What institutional resources exist to help you address these variables?
10. The patient is the source of control for their care.	• Assess the degree to which your patient or their designee is the source of control for the care plan. • What factors are constraining this and what are you doing to address these factors?

Source: Principles from Rodak, S. (2012). *10 Guiding Principles for Patient-Centered Care*. https://www.beckershospitalreview.com/quality/10-guiding-principles-for-patient-centered-care.html. Reprinted with permission from Becker's Hospital Review.

Numerous nurse theorists have struggled to describe the caring central to the work of nursing. Travelbee (1971), an early nurse theorist, developed the Human-to-Human Relationship Model, which defined nursing as an interpersonal process whereby the professional nurse practitioner assists an individual, family, or community to prevent or cope with the experience of illness and suffering and, if necessary, to find meaning in these experiences. Benner and Wrubel (1989) wrote that caring is a basic way of being in the world, and that caring is central to human expertise, curing, and healing. "Nursing is viewed as a caring practice whose science is guided by the moral art and ethics of care and responsibility…. Nurses provide care for people in the midst of health, pain, loss, fear, disfigurement, death, grieving, challenge, growth, birth, and transition on an intimate front-line basis. Expert nurses call this the *privileged place of nursing*" (p. xi). Watson's (2008) theory of transpersonal caring begins with the conviction that humans are to be valued, cared for, respected, nurtured, understood, and assisted. She believes that caring can be demonstrated and practiced, and that nurses should create caring environments in which patients are accepted as they are and are invited to grow and realize their full potential. She reminds nurses that this model is transformative in that the nurse–patient relationship influences both the nurse and the patient for better or for worse. Finally, Swanson (1991) identified five caring processes and defined caring as "a nurturing way of relating to a valued other toward whom one feels a personal sense of

commitment and responsibility" (p. 165).

There is no universally accepted definition of caring. You should become familiar with the care models described in Table 13-1 and see if you agree with the convictions held by nurse members of the International Association of Human Caring (IAHC). Members of the IAHC believe:

- **Caring** is the human mode of being.
- Caring is the essence of nursing and the moral imperative that guides nursing praxis (education, practice, and research).
- Caring is both spiritual and human consciousness that connects and transforms everything in the universe.
- Caring in nursing is action and competencies that aim toward the good and welfare of others.
- Caring in nursing is a special way of being, knowing, and doing with the goal of protection, enhancement, and preservation of human dignity.
- Care is culturally diverse and universal and provides the broadest and most important means to study and explain nursing knowledge and nursing care practices (www.humancaring.org).

Before reading further, reflect on how these convictions will influence your future practice. If you agree that caring is essential to being human and is the way nurses promote healing, what are your personal strengths and growth opportunities for caring? How can you plan to focus your attention on human caring as you struggle to master tasks such as safely transferring patients, assisting with bathing, or administering medications? How likely are the recipients of your care to describe you as a competent, compassionate, caring nurse? In what ways might nurses relate to patients who may evoke negative feelings? How will you prevent this in your practice? You can read more about care ethics in Chapter 6 and about how to become a healing presence in Chapter 47.

Table 13-1 **Comparison of Benner's *The Helping Role of the Nurse* with Swanson's *Caring Process* and Watson's *Carative Factors***

BENNER: THE HELPING ROLE OF THE NURSES	SWANSON'S CARING PROCESS	WATSON'S CARATIVE FACTORS
• Creating a climate for establishing a commitment to healing • Providing comfort measures and preserving personhood in the face of pain and extreme breakdown • Presencing • Maximizing the patient's participation and control in the patient's recovery • Interpreting kinds of pain and selecting appropriate strategies for pain management and control • Providing comfort and communication through touch • Providing emotional and informational support to patients and families • Guiding patients through emotional and developmental changes	• Knowing: avoiding assumptions, centering on the one cared for, assessing thoroughly, seeking cues, engaging the self of both • Being with: being there, conveying ability, sharing feelings, not burdening • Doing for: comforting, anticipating, performing competently/skillfully, protecting, preserving dignity • Enabling: informing/explaining, supporting/allowing, focusing, generating alternatives/thinking it through, validating/giving feedback • Maintaining belief: believing in/holding in esteem, maintaining a hope-filled attitude, offering realistic optimism, "going the distance"	• Humanistic altruistic system of values • Instillation of faith/hope • Sensitivity to self and others • Helping/trusting human care relationship • Expressing positive and negative feelings • Creating problem-solving caring process • Transpersonal teaching/learning • Supportive, protective, and/or corrective mental, physical, societal, and spiritual environment • Human needs assistance • Existential–phenomenologic–spiritual forces

PROFESSIONAL NURSE

Nurses committed to thoughtful, person-centered practice are careful to assess whether they possess the prerequisite personal attributes along with learned knowledge, blended competencies, and QSEN competencies.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Personal Attributes

Not everyone "has what it takes" to be a professional nurse. As you read the following list of attributes, reflect on how well they characterize you at this stage of your human and professional development.

Open-mindedness. This may also be termed *humility*. Are you open to learn what your patients, families, and colleagues have to teach you?

A profound sense of the value of the person. Do you believe that everyone, literally everyone, matters? Can you think of anyone who deserves less than your best care effort? Are you willing to go to bat for the most vulnerable in our midst? Are you committed to learning how to advocate for those not well served by today's health care system?

Self-awareness and knowledge of your own beliefs and values. Do you know what you believe, why you believe it, and the consequences of your beliefs? Are you sensitive to how your beliefs and values influence your professional relationships?

A sense of personal responsibility for your actions. At the end of the day, will people (your patients and team) be better because of their experiences with you? Are you committed to using your personal expertise, time, and power to coordinate all the care patients and families need?

Motivation to do what you do to the best of your ability because you care about the well-being of those entrusted to your care. Does love get you up and motivate your study and practice? Do you want to be your personal best for those who will count on you? In what ways does your practice (and life) reflect a love of humanity?

Leadership skills. Have you tried to use your influence to help others attain valued goals? Are you committed to using your leadership strengths with patients, families, and colleagues to achieve valued health goals? Learn more about developing your leadership skills in Chapter 10.

Bravery to question the "system." When the plan of care isn't working for a patient or your work environment is interfering with your ability to give good care, are you willing to challenge the status quo, and can you do this effectively? Denise Thornby, previous president of the American Association of Critical Care Nurses, was famous for challenging nurses to "make waves" when change was needed—even when this demanded personal courage. She reminded all of us that the day we don't wake up we will have already created our legacy:

Every day, every moment, you make choices on how to act or respond. Through these acts, you have the power to positively influence. As John Quincy Adams sagely said, 'The influence of each human being on others in this life is a kind of immortality.' So, I ask you: What will be your act of courage? How will you influence your environment? What will be your legacy? When the day arrives that you are no longer able to show up for practice, what do you want colleagues to say about you? What will be *your* legacy?

Knowledge Base

In order to reason through a clinical situation, you must be able to draw upon a body of nursing knowledge that comes from the sources of knowledge described in Chapter 2. Added to this must be research evidence. Box 13-4 outlines the knowledge required for competent clinical reasoning and judgment in nursing. The specific knowledge required in a given care interaction depends on the actual clinical situation. For example, if the situation calls for reasoning about the manifestation of a clinical problem, the nurse will need to understand the disease or condition, its epidemiology, the mechanisms of its pathophysiology, its physical and psychological manifestations, signs and symptoms, and the probabilities of its progression or outcome.

Think back to the nurse who could not locate **Jermaine's** tibial pulse. The nurse needs to know the complications of vascular surgery on the femoral artery and the significance of not being able to palpate the tibial pulse.

If the clinical situation involves a problematic hospital discharge of a patient with disabilities, for example, the nurse's knowledge base must include knowledge of support services available in the local community or knowledge of how and when to contact other team members with this expertise. These knowledge requirements are essential for the

development of clinical reasoning and judgment, discussed later in this chapter.

Blended Competencies

Nurses aim to design and manage each patient's care scientifically, holistically, and creatively. To do this successfully, nurses need many cognitive, technical, interpersonal, and ethical/legal competencies, along with the willingness to use them creatively and critically when working with patients to promote or restore health, to prevent disease or illness, and to facilitate coping with altered functioning. Understanding the importance of these competencies helps you work consciously to develop them while beginning to master the nursing process. Cognitive and technical competencies equip nurses to manage clinical problems stemming from the patient's changing health or illness state. Interpersonal and ethical skills are essential, moreover, for nurses concerned about the patient's broader well-being.

This text uses the term **blended competencies** because, in most instances, nursing actions require all four competencies. A nurse who sets out to suction a patient, for example, must understand the evidence that supports this action, be skilled in handling the required equipment, use the encounter to promote the patient's sense of well-being, and practice in an ethically and legally defensible manner. Few nurses excel naturally in all four of these competencies, and even experienced nurses continue working on becoming more proficient in the knowledge, attitudes, and skills that lead to excellence. These competencies were first introduced and defined in Chapter 1. Box 13-3 will help you to assess your proficiency in these competencies.

Box 13-3 Take the Challenge

Read the following professional behaviors, and circle the number that best reflects the proficiency you now have in each of these essential nursing competencies.

1 = no skills
2 = somewhat skilled
3 = moderately skilled
4 = well skilled
5 = excellent skills

Cognitive Competencies

1	2	3	4	5	• Offer a scientific rationale for the plan of care.
1	2	3	4	5	• Select those nursing interventions that are most likely to yield desired outcomes.
1	2	3	4	5	• Use clinical reasoning and judgment to problem solve creatively.

Technical Competencies

1	2	3	4	5	• Use technical equipment with sufficient competence and ease to achieve goal with a minimum of distress to involved participants.
1	2	3	4	5	• Creatively adapt equipment and technical procedures to the needs of particular patients in diverse circumstances.

Interpersonal Competencies

1	2	3	4	5	• Creative use of looks, speech, and touch to communicate respect and to enhance sense of worth
1	2	3	4	5	• Skilled use of compassionate presence and conversation to demonstrate empathy and to obtain sufficient knowledge about the patient to personalize care and serve as an effective advocate
1	2	3	4	5	• Responsible, competent attentiveness to the holistic needs of patients such that trust is built and patients experience comfort of security
1	2	3	4	5	• Value mutual enrichment of both participants in the nurse–patient relationship

Ethical/Legal Competencies

1	2	3	4	5	• Self-motivated to act in ways that advance the interests of patients (consistently trustworthy)
1	2	3	4	5	• Accountable for practice to self, patients served, the caregiving team, and society
1	2	3	4	5	• Consistently serve as effective patient advocate
1	2	3	4	5	• Skilled in mediating ethical conflict among the patient, significant others, health care team, and other interested parties
1	2	3	4	5	• Practice nursing faithful to the tenets of professional codes of ethics
1	2	3	4	5	• Use legal safeguards that reduce the risk of litigation

Developing Cognitive Competencies

Cognitively skilled nurses are critical thinkers. **Critical thinking** is defined as "a systematic way to form and shape one's thinking. It functions purposefully and exactingly. It is thought that is disciplined, comprehensive, based on intellectual standards, and, as a result, well-reasoned" (Paul, 1993, p. 20).

DEVELOPING THE METHOD OF CRITICAL THINKING

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

To develop the critical thinking skills essential to quality nursing practice, nurses find it helpful when posed with a challenge to work methodically through a set of five types of considerations: the purpose of thinking, adequacy of knowledge, potential problems, helpful resources, and critique of judgment/decision.

Purpose of Thinking

The first step when thinking critically about a situation is to identify the purpose or goal of your thinking. This helps to discipline your thinking by directing your thoughts toward the goal. The purpose of critical thinking might be to make a judgment about a particular patient or situation or to make a decision about how best to intervene.

Adequacy of Knowledge

At the outset of critical thinking, you need to judge whether the knowledge you have is accurate, complete, factual, timely, and relevant. If you reason with false information or a lack of important data, it is impossible to draw a sound conclusion. You also want to be sure that you understand all the details relevant to the issue. What is at stake? How much time do you have to make a decision? How much room is there for error?

Consider **Addie Warner**, the patient described as "demanding" by some staff. Rather than accept that description, the nurse answers the patient's call light, thereby obtaining information from which to make an informed decision.

Potential Problems

As you become skilled in critical thinking, you will learn to "flag" and remedy pitfalls to sound reasoning. Common problems include working with untested or faulty assumptions, accepting an unproven claim or line of argument, allowing bias to color your thinking, and reasoning illogically, such as making a generalization on the basis of a single experience or case or allowing emotion to rule reason. The more familiar you are with these common blocks to critical thinking, the easier it is to detect them in your own thinking.

Helpful Resources

Wise professionals are quick to recognize their limits and seek help to remedy their deficiencies. Experienced clinicians know that learning is continuous and expect their practice to involve challenges that demand new knowledge. Critical thinkers know what help they need to assist their reasoning and what resources to tap. Key resources include experienced clinicians, texts and journals, institutional policies and procedures, and professional groups and writings.

Critique of Judgment/Decision

Ultimately, you must identify alternative judgments or decisions, weigh the merits of each, and reach a conclusion. It helps to try to predict the consequences of your major options before concluding your reasoning. You will also want to evaluate the alternative you selected as your decision begins to influence your actions.

After using this method to work through an intellectually challenging situation, critique your use of the method in light of the **standards for critical thinking**: clear, precise, specific, accurate, relevant, plausible, consistent, logical, deep, broad, complete, significant, adequate (for the purpose), and fair.

Focused Critical Thinking Guides

Focused Critical Thinking Guide 13-1 (on page 352) illustrates the use of these five considerations to facilitate critical thinking about a care dilemma experienced by a nursing student. The merits of thinking critically about which of the options is most likely to meet that patient's needs are easily seen. Because nurses are accountable for the well-being of their patients, sloppy reasoning is both dangerous and inexcusable—even for someone new to nursing and clinical practice. Other Focused Critical Thinking Guides are found throughout the book.

DEVELOPING THE PERSONAL ATTRIBUTES TO THINK CRITICALLY

Reasoning has a logical or cognitive (thinking) component as well as an emotional or affective (feeling) component, both of which are affected by the personal attributes of the thinker. Critical thinking is also affected by a person's beliefs and values. Nurses must be independent thinkers—that is, they must be careful not to allow the status quo or a persuasive person to control their thinking.

Remember **Addie Warner**, the older woman who was considered demanding by some staff? The student describing her experience with Mrs. Warner in the Reflective Practice box demonstrated independent thinking by not accepting staff members' emotional description of the patient. Rather, the student confronted the situation, obtained information, and then acted based on this information.

When confronted with an intellectual challenge, such as "Why does this patient resist change?" the nurse should proceed cautiously, consulting with the patient and respected colleagues and reviewing the literature. Only then can the nurse reach a true clinical judgment. Compare this with a nurse who makes a snap judgment that a patient is "unreasonable" based only on hearing the comments of another nurse—even if that nurse is the nurse manager.

Recall **Charlotte Horvath**, the single mother needing wound care teaching. A nurse who is not an independent thinker might quickly assume that Ms. Horvath just wasn't interested in caring for her child at home. But a nurse who is an independent thinker would investigate the situation further before making a decision. Contrast these approaches:

"A good mother who loves her child would find a way to come to a teaching session." [implies judgment]
"Can you tell me what is making it difficult for you to come to a teaching session?"

Alfaro-LeFevre (2002–2020) has carefully developed a list of **critical-thinking indicators** (CTIs), which are evidence-based descriptions of behaviors that demonstrate the knowledge, characteristics, and skills that promote critical thinking in clinical practice (Boxes 13-4 on page 353 and 13-5 on page 354). If you are serious about developing the critical thinking skills needed for professional practice, now would be a good time to sit down with several people who know you well to see which critical thinking characteristics you possess and which need work. One way to do this is to ask these questions about each characteristic in Box 13-5:

. Ask the people who know you well: "On a scale of 1 to 7 (with 1 being almost never and 7 always), to what degree do I demonstrate this characteristic that promotes critical thinking?"
. Think of examples of times when you demonstrated and failed to demonstrate these characteristics. Ask yourself: "What were the consequences in these situations?"

13-1 Focused Critical-Thinking Guide

MAINSTREAM VERSUS ALTERNATIVE MEDICINE

You are a nursing student. Your friend, Amy Chang, confides to you that she is very worried about her grandmother. When you meet Mrs. Chang, she demonstrates many of the assessment findings related to heart failure. Although her family has entreated her to seek medical attention, Mrs. Chang insists on relying on herbal teas and traditional Chinese remedies. Now 88 years old, Mrs. Chang came to America from mainland China when she was 14. Although she raised a family that is now thoroughly "Americanized," Mrs. Chang has resisted embracing her new culture and now wants nothing to do with "American medicine." Amy, who is also a nursing student, loves her grandmother dearly and is frustrated by her stubborn refusal to see an internist. Both of you have reason to believe that she could be

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

helped by medical attention. What do you do?

1. Identify goal of thinking

Clarify your thinking about alternative medicine so that you can decide how you ought to respond to Mrs. Chang's worsening physical condition.

2. Assess adequacy of knowledge

Pertinent circumstances: Although you have strong reason to believe that Mrs. Chang is suffering from congestive heart failure, she has not been medically diagnosed, and you lack definitive knowledge about her medical condition and the likelihood that she would respond to treatment. You do know that she places a high value on traditional Chinese culture and strongly believes that if she is to be healed, the healing will result from herbal teas and traditional Chinese remedies. She has no confidence in American medicine. Her family describes her as being extremely strong willed and very lovable. You do not know if she has the benefit of seeing a competent practitioner of Chinese medicine.

Prerequisite knowledge: To decide how you should respond in this situation, you need to know that mainstream American medicine is not the only beneficial system of medicine. It would be helpful for you and Mrs. Chang's family to learn more about Chinese medicine and the probability of its benefiting her (as well as the possibility of its harming her) in her present condition. You will also need to learn more about what is essential to Mrs. Chang's well-being. How much value does she place on physical health? How important is it for her to live (and possibly die) within the familiar and comforting boundaries of her culture? You will want to assess what teaching, counseling, and support Mrs. Chang needs to reach an informed and voluntary decision that is right for her.

Room for error: Because Mrs. Chang's life may literally be at stake, there is not much room for error in the manner you and her family choose to respond. Even if her condition is not life threatening, her sense of well-being may be severely threatened if she feels forced to pursue treatment that is alien and frightening.

Time constraints: Although you are uncertain about the seriousness of her condition, you understand that the sooner Mrs. Chang receives effective therapy, the better. Unless her condition suddenly deteriorates, this is not a decision that needs to be made within the next 24 hours.

3. Address potential problems

The most serious obstacle to critical thinking in this situation would be an inability to weigh the respective merits of alternative healing systems. Cultural bias may result in the untested assumption that American medicine is necessarily superior to all other systems of healing and that it would be morally wrong to support a choice of anything else. The love of Mrs. Chang's family and their desire to do everything possible to keep her well may interfere with their ability to allow her the freedom to make the choice that is right for her.

4. Consult helpful resources

Your first challenge will be to learn more about traditional Chinese medicine by consulting with local authorities and available literature. The National Institutes of Health have now established an Office of Alternative Medicine, which may provide helpful information and which is easily accessed through their website. Your most important resource may be Mrs. Chang herself; it will be important to try to learn from her as much as you can about what she values and what her goals are at this point in her life. You will also want to be sure that Mrs. Chang has the benefits of a competent practitioner of Chinese medicine.

5. Critique judgment/decision

After getting to know Mrs. Chang better, you realize that she is firmly committed to her ways and adamant about not going to an American doctor or into a hospital at this point of her life. Thus, you (with her family) have several options: to force her to see an internist against her will, possibly deceiving her to get her to the internist's office, or to support her choice to rely on familiar remedies, which may or may not successfully resolve her problems. The first alternative may save her life, and her family can see no other choice. You realize that by making this choice, the family is imposing its values on Mrs. Chang and violating her autonomy, her right to determine the course of her life. You decide to support her and to try to explain to her family the importance of doing this. You understand that if her condition is serious and her traditional remedies prove ineffective, her death may be hastened, but she accepts this consequence and prefers it to embracing an alien and frightening culture. An alternative strategy that might result in a win–win result would be to find an American Chinese physician who practices both Chinese and American medicine. If Mrs. Chang could be persuaded to visit this practitioner, she would experience the best of both medical traditions.

Box 13-4 **Knowledge and Intellectual Skills Critical-Thinking Indicators (CTIs)**

Knowledge

Requirements vary, depending on the context (e.g., specialty practice).

Relates Knowledge of

- Nursing and medical terminology
- Nursing versus medical and other models, roles, and responsibilities
- Scope of nursing practice (qualifications; applicable standards, laws, and rules and regulations)
- Related anatomy, physiology, and pathophysiology
- Spiritual, social, and cultural concepts
- Normal and abnormal growth and development (pediatric, adult, and gerontologic implications)
- Normal and abnormal function (bio-psycho-social-cultural-spiritual)
- Factors affecting normal function (bio-psycho-social-cultural-spiritual)
- Nutrition and pharmacology principles
- Behavioral health and disease management
- Signs and symptoms of common problems and complications
- Nursing process, nursing theories, research, and evidence-based practice
- Reasons behind policies, procedures, and interventions; diagnostic studies implications
- Ethical and legal principles
- Risk management and infection control
- Safety standards, healthy workplace standards, and principles of learning and safety cultures
- Inter-relationship of health care disciplines and systems
- Reliable information resources

Demonstrates

- Focused nursing assessment skills (e.g., breath sounds or IV site assessment)
- Mathematical problem solving for drug calculations
- Related technical skills (e.g., n/g tube or other equipment management)

Clarifies

- Personal biases, values, beliefs, needs
- How own culture, thinking, personality, and learning style preferences differ from others'
- Level of commitment to organizational mission and values

Intellectual Skills/Competencies

Demonstrates Nursing Process and Decision-Making Skills

- Communicates effectively orally and in writing
- Identifies practice scope: applies standards, principles, laws, and ethics codes
- Makes safety and infection control a priority; prevents and deals with mistakes constructively
- Includes patient, family, and key stakeholders in decision making; teaches patient, self, and others
- Identifies purpose and focus of assessment
- Assesses systematically and comprehensively
- Distinguishes normal from abnormal; identifies risks for abnormal
- Distinguishes relevant from irrelevant; clusters relevant data together
- Identifies assumptions and inconsistencies; checks accuracy and reliability (validates data)
- Recognizes missing information; gains more data as needed.
- Concludes what's known and unknown; draws reasonable conclusions—gives evidence to support them
- Identifies both problems and their underlying cause(s) and related factors; includes patient and family perspectives
- Recognizes changes in patient status; takes appropriate action
- Considers multiple ideas, explanations, and solutions
- Determines individualized outcomes and uses them to plan and give care
- Manages risks, predicts complications
- Weighs risks and benefits; anticipates consequences and implications—individualizes interventions accordingly
- Sets priorities and makes decisions in a timely way
- Reassesses to monitor outcomes (responses)
- Promotes health, function, comfort, and well-being
- Identifies ethical issues and takes appropriate action
- Uses human and information resources; detects bias

Additional Related Skills

- Advocates for patients, self, and others
- Engages and empowers patients, families, peers, and coworkers

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

- Fosters positive interpersonal relationships; addresses conflicts fairly; promotes healthy workplace and learning cultures
- Promotes teamwork (focuses on common goals, respects diversity; encourages others to contribute in their own way)
- Facilitates and navigates change
- Organizes and manages time and environment
- Gives and takes constructive criticism
- Delegates appropriately (matches patient needs with worker competencies; determines worker learning needs, supervises and teaches as indicated; monitors results personally)
- Leads, inspires, and helps others move toward common goals
- Demonstrates systems thinking (shows awareness of relationships existing within and across health care systems)

Source: Reprinted with permission from Alfaro-LeFevre, R. (2002–2020). *Critical thinking indicators (CTIs)*. www.AlfaroTeachSmart.com.

It can be helpful to see if you and others you invite to evaluate your characteristics reach the same conclusions about your strengths and areas for improvement.

Another way to use this list is to try to determine as a class which characteristics in Box 13-5 accurately describe your class! Alternatively, you can compare groups. For example, as a rule, which characteristics do nurses as a group and other health care providers as a group demonstrate?

As you begin clinical practice, you can also use the lists in Box 13-4 to critique your competence for professional practice.

Box 13-5 Personal Critical-Thinking Indicators (CTIs)

PERSONAL CTIs are brief descriptions of behaviors, attitudes, and characteristics often seen in critical thinkers. These are the behaviors that promote development of critical thinking habits. The below is the ideal—no one's perfect. Characteristics vary depending on circumstances such as comfort and familiarity with the people and situations at hand. What matters is *patterns* of behavior over time (is the behavior usually evident?). If you're a critical thinker, you probably can pick some characteristics you'd like to improve (critical thinkers are innately focused on improvement).

- **Self-aware:** Identifies own learning, personality, and communication style preferences; clarifies biases, strengths, and limitations; acknowledges when thinking may be influenced by emotions or self-interest.
- **Genuine/authentic:** Shows true self; demonstrates behaviors that indicate stated values.
- **Effective communicator:** Listens well (shows deep understanding of others' thoughts, feelings, and circumstances); speaks and writes with clarity (gets key points across to others).
- **Curious and inquisitive:** Asks questions; looks for reasons, explanations, and meaning; seeks new information to broaden understanding.
- **Alert to context:** Looks for changes in circumstances that warrant a need to modify approaches; investigates thoroughly when situations warrant precise, in depth thinking.
- **Reflective and self-corrective:** Carefully considers meaning of data and interpersonal interactions, asks for feedback; corrects own thinking, alert to potential errors by self and others, finds ways to avoid future mistakes.
- **Analytical and insightful:** Identifies relationships; expresses deep understanding.
- **Logical and intuitive:** Draws reasonable conclusions (if this is so, then it follows that because…); uses intuition as a guide; acts on intuition only with knowledge of risks involved.
- **Confident and resilient:** Expresses faith in ability to reason and learn; overcomes problems and disappointments.
- **Honest and upright:** Looks for the truth, even if it sheds unwanted light; demonstrates integrity (adheres to moral and ethical standards; admits flaws in thinking).
- **Autonomous/responsible:** Self-directed, self-disciplined, and accepts accountability.
- **Careful and prudent:** Seeks help as needed; suspends or revises judgment as indicated by new or incomplete data.
- **Open and fair-minded:** Shows tolerance for different viewpoints; questions how own viewpoints are influencing thinking.
- **Sensitive to diversity:** Expresses appreciation of human differences related to values, culture, personality, or learning style preferences; adapts to preferences when feasible.
- **Creative:** Offers alternative solutions and approaches; comes up with useful ideas.
- **Realistic and practical:** Admits when things aren't feasible; looks for useful solutions.
- **Proactive:** Anticipates consequences, plans ahead, acts on opportunities.

- **Courageous:** Stands up for beliefs, advocates for others, doesn't hide from challenges
- **Patient and persistent:** Waits for right moment; perseveres to achieve best results.
- **Flexible:** Changes approaches as needed to get the best results.
- **Health-oriented:** Promotes a healthy lifestyle; uses healthy behaviors to manage stress.
- **Improvement-oriented (self, patients, systems): Self**—identifies learning needs; finds ways to overcome limitations, seeks out new knowledge. **Patients**—promotes health; maximizes function, comfort, and convenience. **Systems**—identifies risks and problems with health care systems; promotes safety, quality, satisfaction, and cost containment.

Developing Technical Competencies

Some people are naturally "good with their hands" and quickly master intricate procedures that involve working with technical equipment. Others have to practice procedures many times before they feel competent handling the equipment and performing clinical activities independently. Whatever your natural level of technical skill, developing the following habits can help you master the manual skills essential in the nursing process:

- When a procedure demands manual dexterity or a complex series of steps, practice the necessary skill until you feel confident in your ability before attempting to perform it with a patient. Simulation exercises are a great help in developing both your competence and confidence.
- Take time to familiarize yourself with new equipment before using it in a clinical procedure. Understand how it works and what supplies are needed to ensure optimal functioning. If possible, anticipate problems and know how to remedy them.
- Identify nurses who are technical experts and ask them to share their secrets. Many experienced clinicians have developed quality, time-saving techniques they are willing to share.
- Never be ashamed to ask for help when feeling unsure of how to perform a procedure or manage equipment. Don't overlook the patient or family caregiver as a source of helpful hints for care they routinely provide. Never forget that the patient's well-being—and sometimes the patient's life—depend on your technical competence.

Many nursing procedures are described in the clinical chapters in this text. Performance checklists break each procedure down into its component parts, allowing you to evaluate your performance of each step of the procedure. This type of self-testing enables you to quickly identify and remedy any deficiencies in technical skills.

Developing Interpersonal Competencies

Interpersonal skills are essential to thoughtful, person-centered practice. Interpersonal caring involves promoting the dignity and respect of patients as people and establishing a caring relationship. As a result, both the nurse and patient experience mutual enrichment.

QSEN PATIENT-CENTERED CARE

Beginning with your first clinical encounters, learn to value seeing health care situations "through the patient's eyes." You will want to willingly support patient-centered care for individuals and groups whose values differ from your own.

PROMOTING HUMAN DIGNITY AND RESPECT

If you are committed to respecting patients' human dignity, you will find it helpful to reflect on these questions:

- What obligates me to respect patients' human dignity? Why should I respect all patients equally? Are some patients more deserving of respect than others? Can a patient ever forfeit the right to be respected?
- What does it mean to respect the dignity of patients? What are five concrete ways I can demonstrate respect?
- What are my strengths and deficiencies when it comes to respecting patients?
- In what ways (if any) must I change to be faithful to the duty of respecting the dignity of each patient, family member, and colleague?
- What patients most challenge my ability to give care respectfully? How do I respond to this challenge? What does this teach me for the future?

Nurses often underestimate their power to help a patient heal simply through their respectful and caring presence. Each time a nurse walks into a room, the nurse communicates one of two messages: (1) "You are a job to be done—you mean nothing to me" or (2) "You are a person of worth, and I care about you." Even a 60-second nurse–patient interaction can enhance or jeopardize human well-being. Therefore, nurses must be sensitive about what their looks, speech, and touch communicate to patients and colleagues. The more vulnerable the patient and the more threatened the patient's sense of self, the more powerful effect the nurse's message has on the person's sense of worth and well-being.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Consider **Addie Warner**, the patient described in the Reflective Practice display. Imagine the message that she received from staff who consider her difficult when she used her call light to ask for help. Most likely, the message conveyed was negative. Compare this to the message communicated by the nursing student who helped get her out of bed and get washed: a more positive message supporting the patient's self-worth.

The learning activity in Box 13-6 (on page 356) was developed for nurses caring for older adults in a long-term care facility. To help develop interpersonal skills, try these activities with a friend. Take turns being both the nurse and the older adult and talk about how different types of nursing presence makes you feel.

ESTABLISHING CARING RELATIONSHIPS

Increasingly, nurses report that new systems of care and the demand to work "harder, faster, and smarter" to keep up in today's competitive health care arena are making traditional nurse–patient relationships difficult to attain. Note that when the ANA revised the definition of nursing in *Nursing: Scope and Standards of Practice*, it highlighted nurse caring:

> This revised definition presents a reordering of the content from the 2015 version, including the art and science of caring, replacing abilities with human functioning, and incorporating references to compassionate presence and recognition of the connection of all humanity. Such refinements reflect an evolution of thinking over the past five years and present enhancements intended to lead into the future (2021, p. 1).

As you begin your nursing practice, ask yourself what priority you assign to caring. Nurses who accept that there can be no excellence in nursing in the absence of this relationship commit themselves to finding creative means to establish compassionately caring relationships. Obviously, many variables influence the quality of relationships that are possible, not the least of which is how sick the patient is and the patient's length of stay. Helpful reflection questions include the following:

- Do I know my patients well enough to promote anything more than their physical well-being?
- If asked to describe a patient, would I be able to report on anything other than the patient's physical condition?
- Is the care I routinely provide really holistic, individualized, prioritized according to medical need and the patient's valued interests and goals, and continuous? Do my care plans reflect this?
- What does the content of the patient report and nursing documentation communicate about nursing priorities in my practice setting?
- What are my strengths and deficiencies in creating caring relationships?
- In what ways (if any) must I change/grow to establish better caring relationships?

Nurses committed to caring relationships routinely use opportunities for conversation to communicate genuine interest in who the patient is and what the patient is experiencing to provide meaningful nursing assistance. For example, rather than just chatting aimlessly with a talkative patient, a nurse skilled in developing caring relationships will direct the conversation. Here are some leading statements or questions that are often successful in eliciting useful information from older adults:

- "Tell me something about your life at home. What do you miss most now that you are here?"
- "What family members and friends do you see most often? Who do you think knows you best and would you trust to speak for you if you were ever unable to speak for yourself?"
- "Most of us have some goal or dream that keeps us going. It might be owning our own home, seeing some relationship patched up, or being able to celebrate the birth of a grandchild. What is your dream?"
- "When you've had troubles in the past, what did you draw on for strength? What keeps you going?"
- "It looks like you've got a lot of time for thinking these days … would you like to share what's been on your mind?"
- "It looks like we'll be spending some time together … what would you like to do with this time? How may I help you?"
- "What would you like us to know that will help us to better meet your needs?"
- "Hospitals can be scary places [Alternatively, "illness can be scary," "bringing a loved one home from the hospital and shouldering the burden of caregiving alone can be scary"] … how can I help you?"

Box 13-6 **Developing Interpersonal Skills**

Human Dignity: How Who I Am as a Caregiver Affects Others

Description

The purpose of this exercise is to explore the notion of "therapeutic use of self." You will be challenged to reflect on the effect your looks, speech, and touch have on other people. Role-play and guided discovery will be used to enable you to experience the affirming and negating influences of different means of human relating.

Objectives

Upon conclusion of this exercise, you will be able to:

1. Demonstrate how looks, words, and touch can be used to harm or benefit others.
2. Describe how the way you approach others enhances or diminishes their well-being.
3. Identify one care behavior you plan to modify to improve your nursing practice.

Learning Activities

Invite an experienced nurse to demonstrate how looks, words, and touch can be used to communicate two different messages to others: "You are a job to be done—you mean nothing to me" and "You are precious, and I care about you." After the demonstration, team up with another student, and experience giving and receiving these messages. Share the feelings that you both experienced. After these preliminary exercises, role-play the following suggested nursing situations (or others of your choosing), and once again process the experience. Talk about the relevance of this experience to human interaction in general, and conclude the exercise by writing a goal for your practice.

Worksheet

A. Practice looking at a colleague two different ways:
   1. "You are a job to be done—you mean nothing to me."
   2. "You are precious, and I care about you."

B. Practice speaking to a colleague in two different ways:
   1. Indifferent: "Your patient, your light."
   2. Helpful: "I think Mrs. Jones's light is on again. Do you need help?"

C. Practice touching a colleague in two different ways:
   1. Indifferent: Pick up your colleague's wrist and feel for a pulse.
   2. Using warm lotion, massage your colleague's hands.

D. Talk about how each of these looks, words, and touches made you feel. Talk about how you think they make patients feel.

E. Role-play each of the following situations in two different ways, trying to incorporate looks, words, and touches that communicate:

First time:	You are a job to be done—you mean nothing to me.
Second time:	You are precious, and I care about you.

   1. Student feels overwhelmed by patient care assignment and approaches clinical instructor to discuss her options.
   2. Student walks into patient's room to begin morning care.
   3. Student assists older adult to stand and ambulate around room.
   4. Student brings medication to patient.
   5. Student approaches another student and asks for help changing the bed linens of an obese patient who is on complete bed rest.

F. Name one thing you have decided to try to do differently when you take care of your patients as a result of this session.

G. Does what you experienced today have any implications for who you are when you are not nursing?

Nurses who are sensitive to the well-being of their patients can find many ways to communicate caring. Happily, most caring is mutually enriching, and nurses who care find themselves reenergized for the more demanding aspects of their practice. Read one patient's account of the importance to her of a nurse's caring in the accompanying Through the Eyes of a Patient display.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

PREPARING YOUR ATTENTION AND INTENTION FOR EACH CLINICAL ENCOUNTER

A physician colleague who became a chaplain shared with me that he now appreciates that the most important thing he brings to each bedside encounter is himself, and how his presence comforts and heals. Before visiting a patient, he stops to prepare two things in order to create greater connection and meaning: his *attention* and *intention*. You may find his practice of using the experience of handwashing helpful.

> There are many ways different people prepare their attention and intention. I have developed a simple ritual for myself. Before I enter my patient's room, I stop. While washing (or gelling) my hands, I prepare my attention. I bring my awareness to my feet on the ground, then to my breath, and to the flow of water (or gel) over my hands, as if they are washing aside (evaporating away) my preoccupations, leaving only my best intentions. I make a blessing before I dry my hands (or as my hands are drying): I lift up my hands. May I be of service? Then I take a full breath and remind myself: "What matters for you, my patient, is what matters for me. May I meet you in your world as it is for you and accompany you from there. Whatever time I have with you, may I be fully present. May I serve you with all of my life experience as well as my expertise. May I listen fully with a generous heart, without judgment, and without having to fix what cannot be fixed. May my presence allow you to connect with your source of comfort, strength, and guidance as it is for you. May I be well used" (Feldstein, 2011).

Through the Eyes of a Patient

I recently spent 2 months in a university teaching hospital while doctors tried to find a way to regulate my heartbeats. Many of the days were filled with tests, some of which were frightening. I was given many drugs—most of which turned out not to be helpful. I was a 2-hour car ride away from my home, family, and friends—which meant there wasn't always a familiar face at my bedside.

I quickly learned I could judge what kind of day I was going to have as soon as I saw my nurse each morning. All of them brought my medicines and helped with the treatment plan. With some nurses, however, I also experienced the comfort and security of knowing that my expressed needs would be promptly and respectfully tended to. If I needed help getting up to the bathroom or asked for something for pain, I could count on help coming quickly. And finally there were those few with whom I knew I was going to have a great day because they would "make it happen" no matter how sick I was feeling. These were the nurses who offered a hug with their medicines, who had a moment to sit and listen, who teased about the "fashion statements" I was making with my nightgowns, and who "walked me through" new tests so that at least I felt better prepared to face the unknown. Most often, it wasn't what they did but how they did it.

I wish all nurses understood the power they have to influence a patient's basic sense of well-being. A hospital can be a pretty scary, lonely place. Nurses can make all the difference! Will you?

—Mildred Taylor, Pottsville, PA

ENJOYING THE REWARDS OF MUTUAL EXCHANGE

In any helping profession, but especially in nursing, countless opportunities exist to interact with others. Those committed to interpersonal caring enrich everyday interactions by investing them with something of themselves and, in return, receiving something from the other (Fig. 13-2). Think of your last encounter with a patient. Whether you were administering a medication, checking vital signs, or preparing the patient for discharge, you had the choice of merely accomplishing the given task or accomplishing the task while simultaneously communicating a personal gift of support, caring, strength, and peacefulness. Frequently overlooked, these interpersonal gifts might contribute to a patient's healing as significantly as medical interventions. Rather than deplete their giver, these interpersonal gifts invite similar gifts from the recipient, which in return enrich the caregiver. Nothing causes burnout faster than a practice that is reduced to the performance of multiple tasks stripped of their human significance. When a patient is given care in a way that "makes a difference" in terms of their well-being, the patient's gratitude, even when unspoken, helps renew the nurse's energy.

Too seldom do we stop our busy practices long enough to reflect on how who we are that day is influencing the well-being of those receiving our care. It is helpful to question:

- How conscious am I of how my mood influences the well-being of others?
- Have I ever consciously tried to transmit strength, peace, support, or joy to another? What were the results?
- Am I aware of any situation in which my fatigue, anxiety, frustration, or negativity was communicated to a patient in a manner that negatively influenced the patient's well-being?
- Am I conscious of ways in which patients enrich me personally or enrich my practice?
- In what ways is my practice different when I am attuned to the interpersonal dimensions of nurse–patient interactions?
- In what ways must my practice change if I am to facilitate healing in every patient encounter?

FIGURE 13-2. Interpersonal caring enriches the lives of everyone participating, providing a mutual exchange of giving and receiving.

Developing Ethical and Legal Competencies

Nurses who prize their role in securing patient well-being are sensitive to the ethical and legal implications of nursing practice. Chapters 6 and 7 describe essential components of ethical and legal competence for nurses. Although it can take years to master effective patient advocacy skills and to become proficient in mediating ethical conflict, even beginning nurses are responsible for certain basic ethical skills. For example, one of the greatest challenges nursing students face is balancing the competing demands of home life, school, and the hospital or practice setting.

Nurse Self-Care Alert

Learning to be true to yourself, to the patients for whom you are responsible, to the caregiving team, and to the profession and society is an ongoing struggle for nurses. At no time was this struggle more acute than during the COVID-19 pandemic.

Examining your sense of accountability is crucial as you assume professional responsibilities.

Nurses committed to interpersonal caring hold themselves accountable for the human well-being of patients entrusted to their care. Being accountable means being attentive and responsive to the health care needs of individual patients. It means that your concern for the patient transcends whatever happens during your shift, and that you ensure continuity of care when you leave a patient. In today's system of increasingly fragmented care, patients often find themselves unable to point to any single caregiver who knows their overall situation and is capable and willing to coordinate the efforts of the health care team. Being responsive and responsible earns a patient's trust that "all will be well" as health care needs are addressed. Nurses committed to responsible, compassionate caring reflect on the following:

- To what extent does my commitment to securing the human well-being of those in my care dictate my work priorities?
- How comfortable am I voicing unmet patient needs to other members of the health care team? Is meeting the patient's needs more important to me than remaining in my comfort zone? Am I an effective advocate?
- Do other caregivers listen when I present patient concerns because of my successful record of patient advocacy?
- What system variables (e.g., nurse–patient ratios, skill mix, availability of resources) need to change for us to better meet the human needs of our patients?
- Have I read ANA's *Code of Ethics for Nurses with Interpretive Statements* (2015), and am I ready to meet nursing's ethical obligations?
- In what ways must I change for my patients to be able to count on me to respond in a responsible way to their needs?

Nurses who are sensitive to the legal dimensions of practice are careful to develop a strong sense of both ethical and legal accountability. Competent practice is a nurse's best legal safeguard. Nurses seeking to develop legal competence may find it helpful to ask these questions:

- Do I know the legal boundaries of my practice? Have I read my state nurse practice act?
- Am I familiar with ANA's *Nursing: Scope and Standards of Practice* (2021)?
- Am I familiar with pertinent institutional procedures and policies?
- Do I "own" my personal strengths and weaknesses and seek assistance as needed?
- Am I careful never to accept responsibility for an assignment for which I am unprepared?
- Am I knowledgeable about, and respectful of, patient rights?
- Does my documentation provide a legally defensible account of my practice?

When working to develop ethical and legal accountability, nurses must recognize that both deficiencies and excesses of responsible caring are problematic. Although it is reasonable to hold oneself accountable for promoting the human well-being of patients, nurses can err by setting unrealistic standards of responsiveness and responsibility for themselves.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Prudence is always necessary to balance responsible self-care with care of others. Inexperienced nurses may feel totally responsible for effecting patient outcomes beyond their control and may become frustrated and sad when unable to produce the desired outcome. Conversations with other nurses about what is reasonable to hold ourselves and others accountable for are always helpful.

QSEN Competencies

The overall goal of the **QSEN (Quality and Safety Education for Nurses)** project is to meet the challenge of preparing future nurses who will have the knowledge, skills, and attitudes (KSAs) necessary to continuously improve the quality and safety of the health care systems within which they work.

Using the Institute of Medicine (now the National Academy of Sciences, Engineering, and Medicine) competencies, QSEN faculty and a National Advisory Board defined quality and safety competencies for nursing and proposed targets for the KSAs to be developed in nursing pre-licensure programs for each competency. See the QSEN website (www.qsen.org) and Box 13-7 for a description of these competencies. To highlight the importance of these competencies, each chapter in this text has a feature entitled *Reflective Practice: Developing QSEN Competencies*. These special features are written by nursing students and will help you to assess your developing mastery of these competencies.

Clinical Reasoning, Decision Making, and Clinical Judgment

The terms *critical thinking, clinical reasoning,* and *clinical judgment* are often used interchangeably. Alfaro-LeFevre (2020, p. 7) offers these helpful distinctions:

- Critical thinking—a broad term—includes reasoning *both* inside and outside the clinical setting.
- **Clinical reasoning** and **decision making**—specific terms—refer to the process you use to think about patient problems in the clinical setting—for example, deciding how to prevent and manage mobility issues. For reasoning about other clinical issues (e.g., teamwork, collaboration, and streamlining workflow), nurses usually use critical thinking.
- **Clinical judgment** refers to the result (outcome) of critical thinking, clinical reasoning, and decision-making—the conclusion, decision, or opinion you make after analyzing information (Fig. 13-3).

Box 13-7 **New Fundamentals in Nursing: Introducing Beginning Quality and Safety Education for Nurses (QSEN) Competencies**

Patient-Centered Care

The traditional concept involves listening to the patient and demonstrating respect and compassion. The QSEN competency emphasizes recognition of the patient or designee as the source of control and full partner in providing compassionate and coordinated care based on respect for patients' preferences, values, and needs. The KSAs include:

- K—Integrate understanding of multiple dimensions of person-centered care: patient, family, and community preferences and values; coordination and integration of care; information, communication, and education; physical comfort and emotional support; involvement of family and friends; and transition and continuity.
- S—Elicit patient values, preferences, and expressed needs as part of the clinical interview, implementation of care plan, and evaluation of care.
- A—Value seeing health care situations "through patients' eyes."

Teamwork and Collaboration

The traditional view of teamwork may involve working side by side with other health care professionals while forming nursing skills. The updated QSEN definition calls for functioning effectively within nursing and interprofessional teams, fostering open communication, mutual respect, and shared decision making to achieve quality patient care. Important beginning KSAs include:

- K—Describe scope of practice and roles of health care team members.
- S—Follow communication practices that minimize risk associated with handoff among providers and across transition in care.
- A—Acknowledge own potential to contribute to effective team functioning.

Evidence-Based Practice

Traditional practices involve adhering to internal policies to standardize skills execution. The QSEN definition specifies the integration of best current evidence with clinical expertise and patient and family preferences and values for delivery of optimal health care. Important, beginning KSAs reveal significant

changes in fundamentals of nursing:

- K—Describe evidence-based practice to include components of research evidence, clinical expertise, and patient and family values.
- S—Base individualized care plan on patient values, clinical expertise, and evidence.
- A—Value the concept of evidence-based practice as integral to determining best clinical practice.

Quality Improvement

A long-standing approach to quality involves routinely updating nursing policies and procedures. The QSEN updated concept of quality improvement recommends use of data to monitor the outcomes of care processes and use of improvement methods to design and test changes to continuously improve the quality and safety of health care systems. The KSAs recommended for early introduction include:

- K—Recognition that nursing and other health professions students are parts of systems of care and care processes that affect outcomes for patients and families.
- S—The Delphi ratings did not identify a beginning skill in quality improvement but rather recommended introduction and emphasis in intermediate or advanced experiences.
- A—Appreciate continuous quality improvement as essential in the daily work of all health care professionals.

Safety

A simplistic, traditional definition of safety is to use bed rails properly to ensure “that my patient does not fall during my shift.” The QSEN update assures recognition of a culture of safety and minimization of risk of harm to patients through both system effectiveness and individual performance. Safety KSAs rated as important to introduce early include:

- K—Examine human factors and other basic safety design principles as well as commonly used unsafe practices (e.g., workarounds, dangerous abbreviations).
- S—Demonstrate effective use of strategies to reduce risk of harm to self or others.
- A—Value the contributions of standardization and reliability to safety.

Informatics

Traditionally, documentation consists of timely and accurate charting. However, the QSEN-updated definition is expanded and calls for using information and technology to communicate, manage knowledge, mitigate error, and support decision making. The KSAs identified as important for early introduction include:

- K—Explain why information and technology skills are essential for safe patient care.
- S—Apply technology and information management tools to support safe processes of care.
- A—Value technologies supporting decision making, error prevention, and care coordination.

People use critical-thinking skills whenever they want to use clear, focused thinking to achieve a result. You can think critically about how to survive the day’s challenges, to find a partner for life, to pass a licensing exam, or to become president! Critical thinking in nursing—which includes clinical reasoning, decision making, and clinical judgment—is purposeful, informed, outcome-focused thinking that:

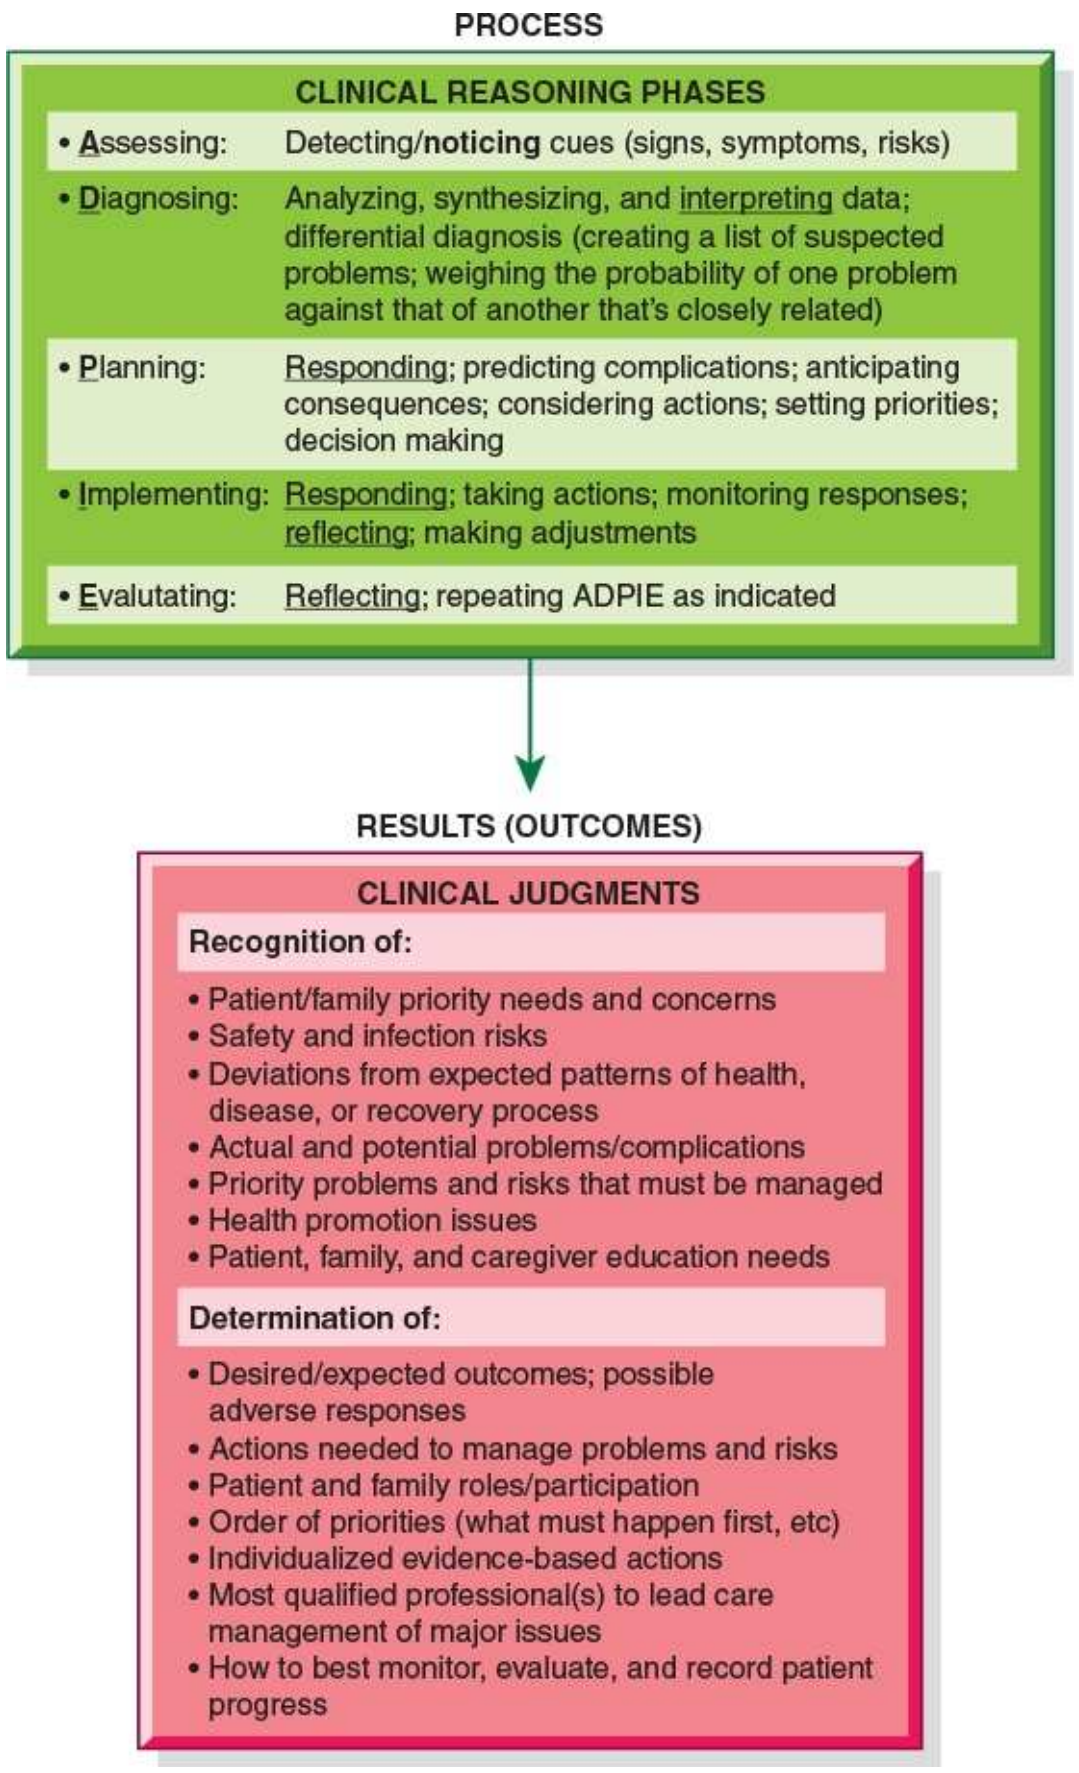

FIGURE 13-3. The process and outcomes of clinical reasoning using ADPIE. Underlined terms indicate Tanner's clinical judgment model (noticing, interpreting, responding, reflecting). (*Source:* Adapted with permission from © 2019 Alfaro-LeFevre. www.AlfaroTeachSmart.com.)

- Is guided by standards, policies, ethics codes, and laws (individual state practice acts and state boards of nursing regulations).
- Is driven by patient, family, and community needs, as well as nurses' needs to give competent and efficient care (e.g., streamlining charting to free up nurses for patient care).
- Is based on principles of the nursing process, problem solving, and the scientific method (which requires forming opinions and making decisions based on evidence).
- Focuses on safety and quality, constantly reevaluating, self-correcting, and striving to improve personal, professional, and system practices.
- Carefully identifies the key problems, issues, and risks involved and includes patients, families, and key stakeholders in decision making early in the process.
- Uses logic, intuition, and creativity and is grounded in specific knowledge, skills, and experience.
- Calls for strategies that make the most of human potential and compensate for problems created by human nature (e.g., finding ways to prevent errors, using information technology, and overcoming the powerful influence of personal views). (Alfaro-LeFevre, 2020, p. 8)

Levett-Jones et al. (2010) prepared the clinical reasoning (CR) model depicted in Figure 13-4 after studying the work of Hoffman, Alfaro-LeFevre, and Andersen. They describe eight main steps or phases in the clinical reasoning cycle. However, in reality, the distinctions between these phases are not so clear. While clinical reasoning can be broken down into steps—look, collect, process, decide, plan, act, evaluate, and reflect—these phases often merge and the boundaries between them become blurred. Remember to learn to recognize, understand, and work through each phase, rather than

making assumptions about patient problems and initiating interventions that have not been adequately considered.

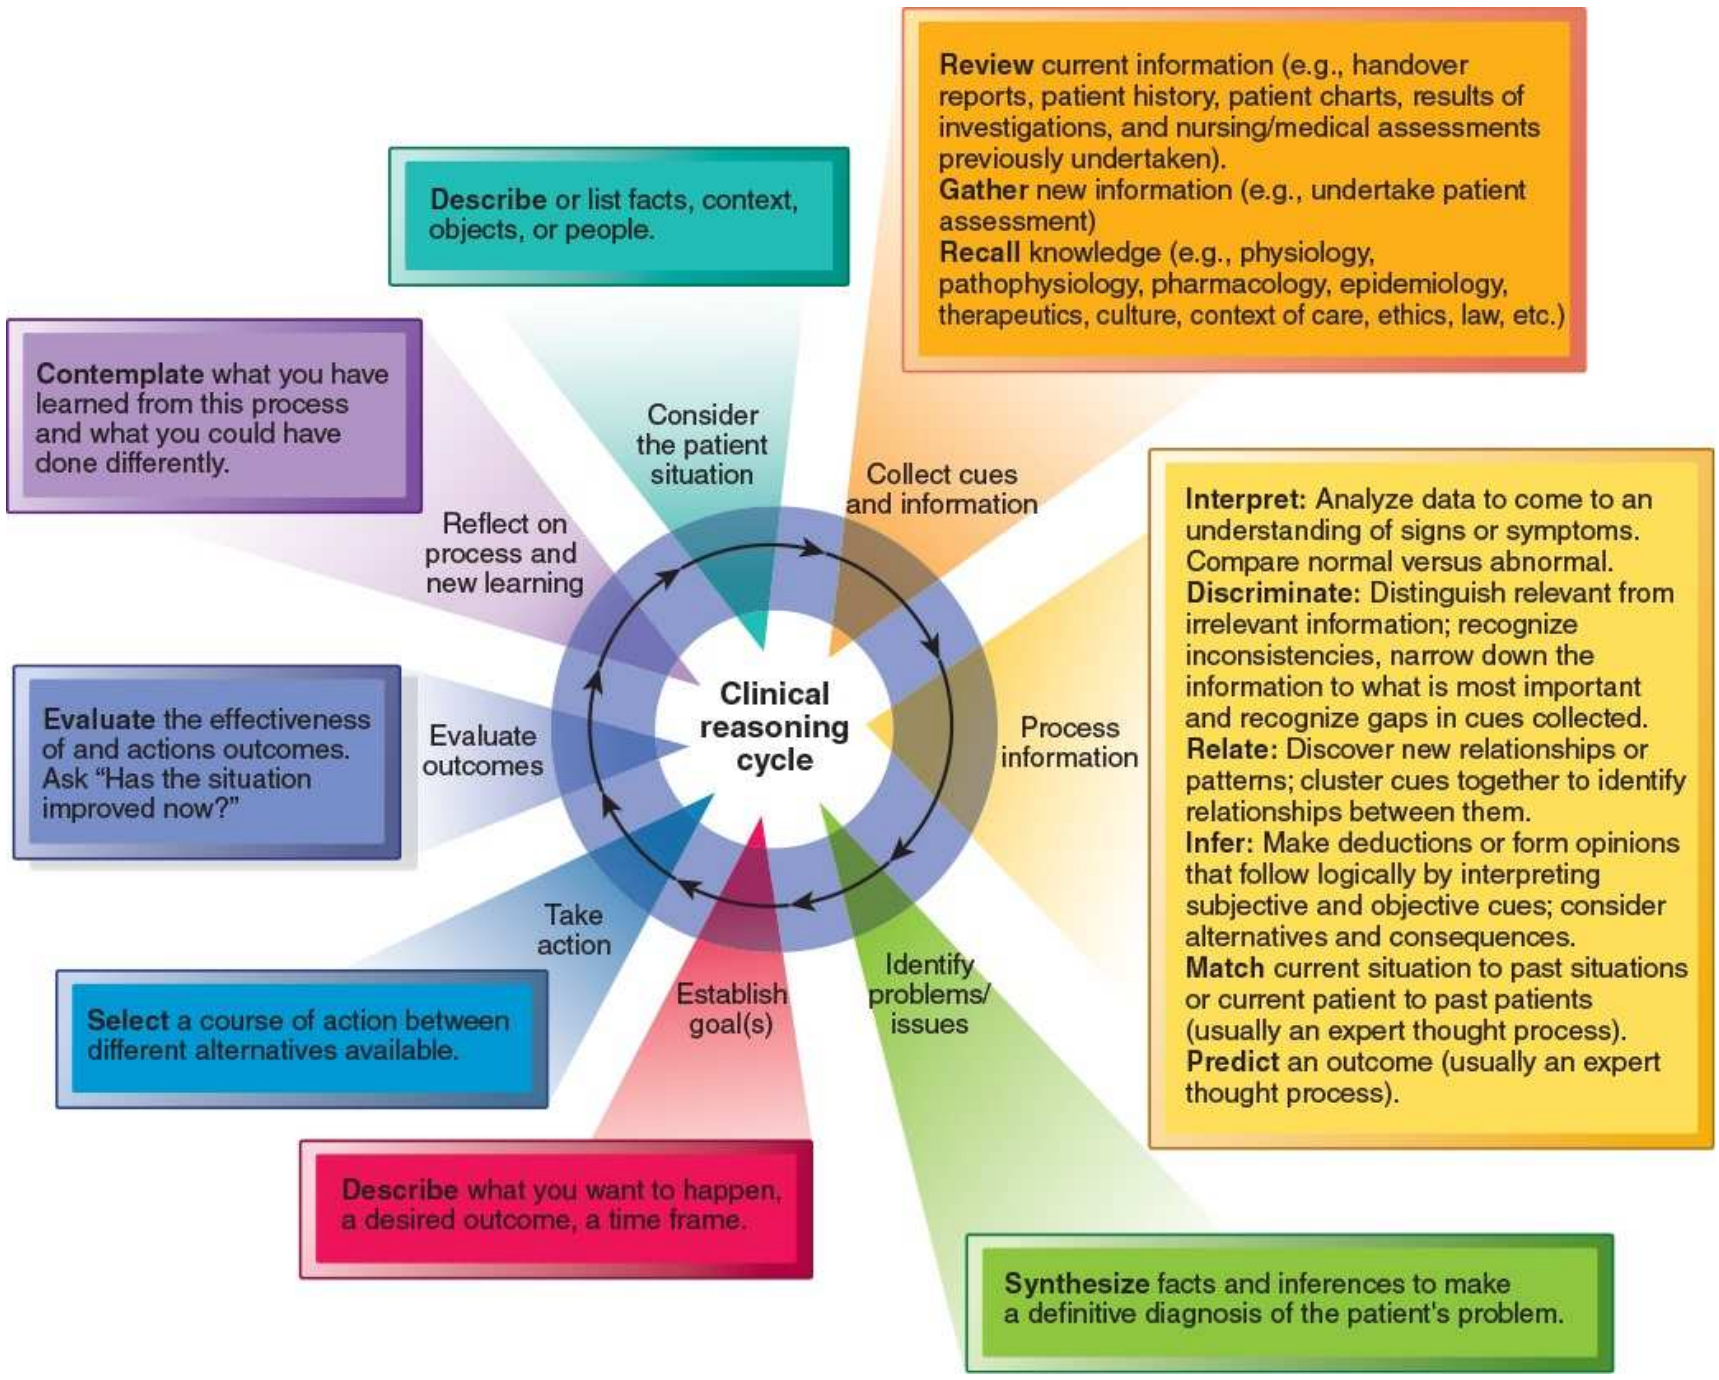

FIGURE 13-4. The clinical reasoning cycle. (*Source:* Reprinted from Elsevier, from Levett-Jones, T., Hoffman, K., Dempsey, J., Jeong, S. Y., Noble, D., Norton, C. A., Roche, J., & Hickey, N. [2010]. The "five rights" of clinical reasoning: An educational model to enhance nursing students' ability to identify and manage clinically "at risk" patients. *Nurse Education Today*, *30*[6], 515–520, with permission from Elsevier.)

Effective use of the CR model by nursing students and its application in practice by novice nurses are directly linked to the five rights of clinical reasoning: the ability to collect the right cues and take the right action for the right patient at the right time and for the right reason (Levett-Jones et al., 2010). The demand on nurses to execute higher-order reasoning skills is increasing as clinical environments become more complex. This complexity requires nurses to be capable of clear, ordered thinking; identifying problems accurately; and effective decision making that demonstrates good clinical judgment (Hill et al., 2017, p. 262). Clinical reasoning includes the ability to recognize clinical problems and to solve them using the cognitive skills of critical thinking, creative thinking, and intuitive thinking. Using all of these skills, the clinician in the nursing context is capable of "thinking like a nurse" (Tanner, 2006, p. 204) in order to make a clinical judgment and come to a decision that results in a nursing action. You may find it helpful to ask these three questions:

. What did you observe?
. What do you make of what you saw?
. What course of action will you take? (Koharchik et al., 2015)

Each of the nursing process chapters that follow has a section highlighting the type of clinical reasoning necessary to successfully implement that step of the nursing process.

Problem Solving

One of the strengths of clinical reasoning is that it is based on a methodology that is familiar to most nursing students: problem solving. Problem solving is a basic life skill; identifying a problem and then taking steps to resolve it are a matter of common sense. However, different approaches to problem solving yield different results, some of which are more successful than others.

TRIAL-AND-ERROR PROBLEM SOLVING

Trial-and-error problem solving involves testing any number of solutions until one is found that works for that

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

particular problem. This method is not efficient for the nurse and can be dangerous to the patient; it is therefore not recommended as a guide for nursing practice. For example, although you might enjoy experimenting with different types of ethnic food as you discover and develop personal food preferences, you would not want to use the trial-and-error method of determining food preferences for a dehydrated and malnourished patient. You want to know, based on clinical research, exactly what food and fluid supplements are most likely to reverse the patient's deficiencies.

Consider **Jermaine Byrd**, the patient who has returned from vascular surgery and whose posterior tibial pulse cannot be palpated. The nurse might use trial-and-error to determine if the pulse is indeed absent or just difficult to palpate or locate. For example, the nurse might try to reposition the fingers for palpation or apply less pressure during palpation to determine if the pulse can be palpated.

SCIENTIFIC PROBLEM SOLVING

Scientific problem solving is a systematic, seven-step problem-solving process that involves: (1) problem identification, (2) data collection, (3) hypothesis formulation, (4) plan of action, (5) hypothesis testing, (6) interpretation of results, and (7) evaluation, resulting in a conclusion or revision of the hypothesis. This method is used most commonly in a controlled laboratory setting but is closely related to the more general problem-solving processes commonly used by health care professionals as they work with patients. The nursing process is an example of this type of problem-solving process.

Again, think back to **Jermaine Byrd**, the postoperative patient with a nonpalpable pulse. The nurse uses scientific problem solving to investigate the situation. For example, after attempts at repositioning yield no change, the nurse would collect more data, such as the temperature and the color of Mr. Byrd's extremity when compared with the opposite leg, existence of pulses above and below the posterior tibial pulse, complaints of pain, numbness, or tingling in the extremity, and Mr. Byrd's overall condition. These findings would lead the nurse to identify whether Mr. Byrd is experiencing vascular compromise, if his pulse was difficult to palpate, or if the nurse needs more skill in palpation. In addition, the nurse could summon the assistance of another nurse to negate or validate the findings. Once the problem is identified, the nurse can then plan care appropriately to meet Mr. Byrd's need.

INTUITIVE PROBLEM SOLVING

For years, nurse theorists and educators argued that clinical judgments should be based on data alone (the logical, scientific, evidence-based method) in an attempt to establish nursing as a science, worthy of the respect of other professions. Today, nurses acknowledge the role of intuitive thinking in making clinical decisions. Many veteran nurses can describe situations in which an "inner prompting" led to a quick nursing intervention that saved a patient's life. When these nurses directly apprehend a situation based on its similarity or dissimilarity to other situations they have experienced, they use intuitive problem solving. **Intuitive problem solving** is thus a direct understanding of a situation based on a background of experience, knowledge, and skill that makes expert decision making possible. A recovery room nurse who realizes that a postoperative patient is deteriorating before there are measurable signs to suggest trouble is using intuitive problem solving, as is an oncology nurse who somehow senses the right moment to teach, offer encouragement, affirm, or simply listen.

Advocates of intuition recommend the following:

- Welcoming flashes of intuition as additions to logical reasoning, rather than as disruptions
- Validating intuitions, and when an intuition cannot be validated (e.g., when the nurse senses that something is wrong with the patient, although there are no clinical signs), careful monitoring of the patient
- Furthering nursing research to help find ways to: (1) cultivate intuition and its typical results (accurate and early diagnosis, vigilant monitoring, better patient care) and (2) document the information that intuition supplies

Beginning nurses must use nursing knowledge and scientific problem solving as the basis for the care they give; intuitive problem solving comes with years of practice and observation. If the beginning nurse has an intuition about a patient, that information should be discussed with the faculty member, preceptor, or supervisor.

CRITICAL THINKING: INTUITIVE, LOGICAL, OR BOTH?

While this text makes a strong case for clinical reasoning that is logical, scientific, and evidence based, it also promotes clinical reasoning that is creative and intuitive. Alfaro-LeFevre, an expert in critical thinking, is quick to note that critical thinking is contextual and changes depending on the circumstances. As an example, she cites brainstorming sessions as a good method for nurturing intuition, because logical thinking may constrain and block ideas. On the other hand, developing policies, procedures, and plans of care requires more logical, evidence-based thought. In summary, when intuition is used alone, there are increased risks and fewer benefits. Intuition often moves problem solving forward quickly, but it may result in a lot of trial-and-error approaches. Logic is the safest approach, but it doesn't foster out-of-the-box ideas and may inhibit right-brain thinkers from getting started. Pairing intuitive and logical thinkers who have learned specific strategies to promote reasoning (e.g., mind mapping) can bring great results (Alfaro-LeFevre, 2020).

Concept Mastery Alert

Critical thinking often involves scientific problem solving, but it also involves intuition, logic, and creative thinking. A person integrates and adapts the use of all these strategies to address the situation.

Creative Thinking

Critical thinking and clinical reasoning also involve reflection and creative thinking. **Creative thinking** involves imagination, intuition, and spontaneity, factors that underpin the art of nursing. Creative thinking is brought into play when you ask "why" or "what if" questions and is most useful when conventional solutions have not resolved a situation. Creative nurse thinkers are able to "think outside the box" and imagine possible consequences, generate original approaches, and identify alternative perspectives. The solution to a challenge may involve resources as yet untapped, effective, and cost saving and may lead to interventions as yet undiscovered and untried. The process of brainstorming may bring out, along with unworkable options, one or two realistic suggestions that would not have surfaced otherwise. Each Reflective Practice box that opens a chapter invites readers to think outside the box as they contemplate possible courses of action.

CLINICAL JUDGMENT MODEL

For decades in nursing and nursing education, clinical judgment was taught using the nursing process. According to ANA (2021):

> Regardless of the theoretical knowledge base upon which nursing practice is derived, the knowledge fits within the multidimensioinal nursing process, the analytical, critical thinking framework guiding professional thinking and activities. The nursing process is conceptualized as a cyclic, iterative, and dynamic process, including assessment, diagnosis, outcomes identification, planning, implementation, and evaluation. The nursing process supports evidence-based practice and relies heavily on the bidirectional feedback loops between components (pp. 11–12).

Students learned the intricacies of assessing patients, diagnosing actual and potential health problems and needs, developing patient outcomes and related plans of care, and implementing and finally evaluating the plans of care. These processes are essential to learning how to think and practice like a nurse and are central to mastering the fundamentals of nursing. This unit describes each phase in the nursing process and your responsibilities. More recently, nurse educators are critiquing the nursing process as being too simple to adequately capture the processes of clinical judgment both beginning and experienced nurses use to ground their practice. A seminal article written by Tanner in 2006 offered a research-based model of clinical judgment highlighting four aspects:

- Noticing, a perceptual grasp of the situation at hand
- Interpreting, developing a sufficient understanding of the situation to respond
- Responding, deciding on a course of action deemed appropriate for the situation
- Reflecting, attending to patients' responses to the nursing action while in the process of acting.

Tanner aimed to offer a model to faculty to help students diagnose breakdowns, identify areas for needed growth, and

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

focus attention on those areas. In 2007, Lasatar used the four phases of Tanner's clinical judgment model to provide the basis for a clinical judgment rubric. Her aim was to offer a bigger picture of clinical judgment development, which would allow students to grasp what clinical judgment involves, evaluate their growth in this area, and identify goals. In the Lasatar (2007) rubric, each of Tanner's four phases is further described by two or three dimensions that elucidate what is meant by each phase (see Table 14-1 on pages 386–387).

In 2009, the National Council of State Boards of Nursing (NCSBN) began to study the importance of clinical judgment in the nursing profession. Of note, their report found that 50% of entry level nurses were involved in practice errors (Smith & Crawford, 2003) and that 65% of entry level nurse errors were related to poor clinical decision making (Brennan et al., 2004). Not surprisingly, only 20% of employers were satisfied with the decision-making abilities of entry level nurses. Further NCSBN study revealed that clinical judgment was one of the top five required skills needed upon entry into the field of nursing. Two other high priority skills in the top five were problem solving and critical thinking. These studies led to the development of the NCSBN Clinical Judgment Measurement and Action Models, which are described in Chapter 14 (NCSBN, 2020). Chapter 14 also shows you how to use recurrent features in this text to help you become proficient in the different phases of the most common clinical judgment models. See Table 13-2 (on page 364) for a comparison of the uses and reasoning phases of each of three major clinical judgment models (CJMs) now influencing nursing education. Note that Alfaro is quick to point out that although CJMs are usually presented as linear models showing step-by-step progression, CJMs are iterative, meaning that the phases are interrelated and repetitive. They require paying attention to changing circumstances and continually reflecting and adjusting until the best results are achieved (Alfaro, 2020).

NURSING PROCESS

As the practice of nursing became more complex in the second half of the 20th century, nurses began to study the process of nursing to both understand and improve the means that nurses use to accomplish their aims.

Table 13-2 Three Major Clinical Judgment Models[a]

CLINICAL JUDGMENT MODEL AND COMMON USES	REASONING PHASES				
Nursing Process (ADPIE[b]) (NCLEX; Education; Simulation; Clinical practice; Interprofessional communication; Documentation)	Assess	Diagnose or Analyze[c]	Plan	Implement	Evaluate
Tanner/Lasater (Education; Simulation; Minimal clinical practice use)		Noticing/Interpreting	Responding		Reflecting
NCSBN CJAM[c] (NGN; No education or practice use as of 2019)		Recognize cues Analyze cues Prioritize hypotheses	Generate solutions	Take action	Evaluate outcomes

[a]Notice that using "phases" instead of "steps" implies that clinical reasoning is a fluid process rather than step by step.

[b]Assess, Diagnose, Plan, Implement, Evaluate.

[c]Clinical judgment requires more than analyzing—it requires bringing data together to come to conclusions (e.g., make decisions; determine priority risks and problems). Therefore, "Diagnose/Decide" may be a more appropriate term. Too many nurses spend too much time analyzing when there are *time pressures* to make decisions (some call this "analysis paralysis").

Source: Reprinted with permission from Alfaro-LeFevre, R. (2020). Comparison of Nursing Process, Tanner/Lasatar, and NGN Clinical Judgment Models. https://www.alfaroteachsmart.com/textbooktools.html.

Historical Perspective

Since Hall first used the term "nursing process" in 1955, many nurses have struggled to define exactly what constitutes the "work of nursing" and what makes nurses successful. In the 1960s, nursing theorists began to describe nursing as a distinct entity among the health care professions and also to delineate specific steps in a process approach to nursing practice. In 1967, Yura and Walsh published the first comprehensive book on nursing process, in which they described four steps in the nursing process: assessment, planning, intervention, and evaluation. They viewed the nursing diagnosis as the logical conclusion of the assessment phase, whereas Gebbie and Lavin (1974) later made nursing diagnosis a separate step in the process. These and other studies led to the development of the five-step nursing process commonly used today: assessment, diagnosis, outcome identification and planning, implementation, and evaluation. Although most nurses call this simply the nursing process, some use the acronym **ADPIE**, assessing, diagnosing, planning, implementing, and evaluating, or **AAPIE**, assessing, analyzing, planning, implementing, and evaluating.

The steps of the nursing process were legitimized in 1973, when the ANA Congress for Nursing Practice developed standards of practice to guide nursing performance. The scope defines the range and boundaries of nursing practice (see Chapter 1 for more information). The standards are authoritative statements by which the nursing profession describes responsibilities for which its practitioners are accountable. These standards were revised in 1991, 1998, 2004, 2010, 2015, and 2021. The six standards of practice (assessment, diagnosis, outcome identification, planning, implementation,

and evaluation) describe a competent level of nursing care as demonstrated by the critical-thinking model of the nursing process. The nursing process encompasses all significant actions taken by registered nurses and forms the foundation of the nurse's decision making.

Although the ANA refers to a six-step nursing process, many practitioners still commonly refer to a five-step nursing process that combines outcome identification and planning into one step. The five-step nursing process is presented throughout this textbook.

The Joint Commission requires that care be documented according to the nursing process, and the National League for Nursing has recommended that educational programs incorporate the nursing process as their intellectual process. In 1982, the state board examinations for professional nursing practice underwent major revisions and began to use the nursing process as an organizing concept. The revised examinations are structured to test the practitioner's ability to assess patients, to diagnose health problems amenable to nursing therapy, and to plan, implement, and evaluate nursing care. The examinations had previously organized content on a medical model, structured according to medical specialties—medicine, surgery, maternity, pediatrics, and psychiatry. In 2023 or 2024, the state board examinations for professional nursing practice are scheduled to be based on the National Council of State Boards of Nursing's clinical judgment measurement model.

Description of the Nursing Process

The **nursing process** is a systematic method that directs the nurse, with the patient's participation, to accomplish the following: (1) assess the patient to determine the need for nursing care, (2) determine nursing diagnoses for actual and potential health problems and needs, (3) identify expected outcomes and plan care, (4) implement the care, and (5) evaluate the results. The phases in this person-centered, outcome-oriented process are interrelated; each phase depends on the accuracy of the steps preceding it. The process provides a framework that enables the nurse, along with the patient, to accomplish the following:

- Systematically collect patient data (assessing)
- Clearly identify patient strengths and actual and potential health problems and needs (diagnosing)
- Develop a holistic plan of individualized care that specifies the desired patient goals and related outcomes and the nursing interventions most likely to assist the patient to meet those expected outcomes (planning)
- Execute the plan of care (implementing)
- Evaluate the effectiveness of the plan of care in terms of patient goal achievement (evaluating)

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Nurses and patients work together as partners to
- promote health
- prevent disease/illness
- restore health
- facilitate coping with altered functioning

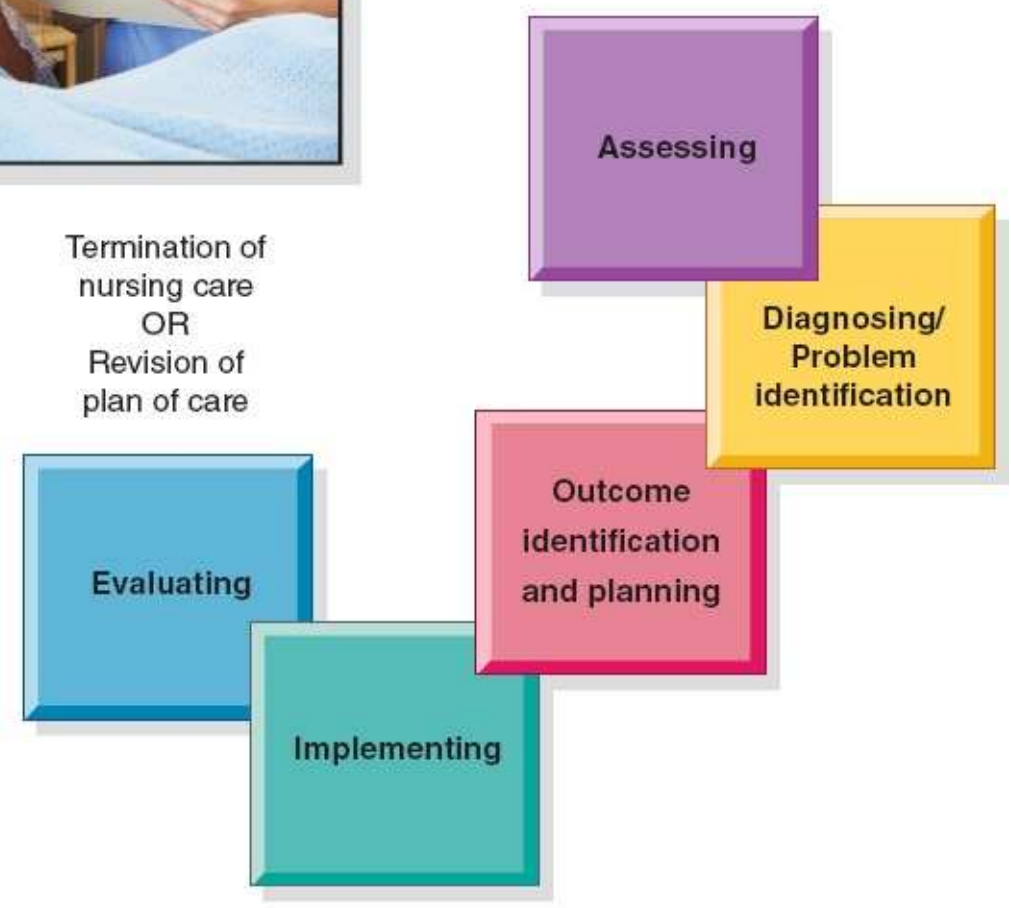

FIGURE 13-5. The iterative phases in the thoughtful, person-centered, outcome-oriented nursing process are dynamic and interrelated. Each of the five phases depends on the accuracy of the preceding step. (*Source:* Photo used with permission from Shutterstock. *Photo by Monkey Business Images*.)

Consider **Addie Warner**, the older adult who had suffered a CVA and is considered "demanding" by some staff. The nurse uses the nursing process framework to determine the Mrs. Warner's presenting problem—that is, her reason for using the call light. By systematically collecting information, determining the Mrs. Warner's strengths and needs, quickly developing a plan for these needs, executing it, and then determining the effectiveness of the plan, the nurse provides Mrs. Warner with safe, quality, effective care.

The five phases of the nursing process are shown in Figure 13-5 and described in Table 13-3 (on page 366). In each phase of the process, the nurse and patient work together as partners (Fig. 13-6); the patient's health state and resources influence the patient's level of participation. When the patient is an infant or is unconscious or uncooperative, the nurse works through the steps of the process with the help of a family member or support person whenever possible.

FIGURE 13-6. Nurses develop powerful partnerships with patients when using the nursing process to plan and deliver care.

Table 13-3 Overview of the Nursing Process

COMPONENT	DESCRIPTION	PURPOSE	ACTIVITIES
Assessing	Collection, validation, and communication of patient data	Make a judgment about the patient's health status, ability to manage their own health care, and need for nursing. Plan individualized holistic care that draws on patient strengths and is responsive to changes in the patient's conditions.	1. Establish the database: • Nursing history • Physical assessment • Review of patient record and nursing literature • Consultation with the patient's support people and health care professionals 2. Continuously update the database. 3. Validate data. 4. Communicate data.
Diagnosing Actual or Potential Health Problems and Needs	Analysis of patient data to identify patient strengths and health problems	Develop a prioritized list of problems/needs.	1. Interpret and analyze patient data. 2. Identify patient strengths and health problems. 3. Formulate and validate nursing problems. 4. Develop prioritized list of problems.
Outcome identification and planning	Specification of (1) patient outcomes to prevent, reduce, or resolve the problems identified; and (2) related nursing interventions	Develop an individualized plan of nursing care. Identify patient strengths that can be tapped to facilitate achievement of desired outcomes.	1. Establish priorities. 2. Write outcomes and develop an evaluative strategy. 3. Select nursing interventions. 4. Communicate plan of nursing care.
Implementing	Carrying out the plan of care	Assist patients to achieve desired outcomes—promote wellness, prevent disease and illness, restore health, and facilitate coping	1. Carry out the care plan. 2. Continue data collection, and modify the plan of care as needed.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

		with altered functioning.	3. Document care.
Evaluating	Measuring the extent to which the patient has achieved the outcomes specified in the plan of care; identifying factors that positively or negatively influenced outcome achievement; revising the plan of care if necessary	Continue, modify, or terminate nursing care.	1. Measure how well the patient has achieved desired outcomes. 2. Identify factors that contribute to the patient's success or failure. 3. Modify the plan of care (if indicated).

Concept Mastery Alert

Assessment is the first phase in the nursing process and always involves gathering data. Data can be obtained from the patient, family, or other sources as well as from the physical examination.

Nursing Process Trends

Although experienced nurses may tell stories about lengthy handwritten plans of individualized care, the trend today is toward standardization and computerization. Nurses at centralized or bedside computer terminals have access to databases that allow them to plan and document care easily. Critical pathways (see Chapter 17)—which target desired outcomes for particular illnesses, procedures, or conditions—and accompanying multidisciplinary staff actions along a timeline provide the standard guidelines for care in many institutions. Although there were national efforts to develop the state of nursing knowledge and science and a standard nursing language (described in Table 13-4), today most practice sites do not use standard nursing language and nurses contribute to common problem and intervention lists. This work is described in subsequent chapters on diagnosis, planning, and implementation.

Characteristics of the Nursing Process

Various words and phrases have been used to describe the nursing process. Key descriptors include *systematic*, *dynamic*, *interpersonal*, *outcome oriented*, and *universally applicable*.

Systematic

Each nursing activity is part of an ordered sequence of activities. Moreover, each activity depends on the accuracy of the activity that precedes it and influences the actions that follow it. Without a complete and accurate database, the nurse cannot identify patient strengths and problems. Lacking knowledge of these, the nurse and patient cannot develop a plan of care based on realistic and valued patient goals. Unless the goals and outcomes are well written, nursing actions and evaluation lack focus and might be ineffective. The nursing process directs each step of nursing care in a sequential, ordered manner.

Table 13-4 Examples of Groups Developing Standard Languages (Vocabularies)

GROUP NAME	FOCUS	PURPOSE
North American Nursing Diagnosis Association (NANDA) International	Diagnoses	Increase the visibility of nursing's contribution to patient care by continuing to develop, refine, and classify phenomena of concern to nurses (see Nursing Diagnosis Quick Reference section). *Website:* www.nanda.org
Nursing Interventions Classification (NIC)	Interventions	Identify, label, validate, and classify actions nurses perform, including direct and indirect care interventions (interventions done directly with patients, e.g., teaching; those done indirectly, e.g., obtaining laboratory studies). *Website:* https://nursing.uiowa.edu/cncce/nursing-interventions-classification-overview
Nursing-Sensitive Outcomes Classification (NOC)	Outcomes	Identify, label, validate, and classify nursing-sensitive patient outcomes and indicators to evaluate the validity and usefulness of the classification, and define and test measurement procedures for the

		outcomes and indicators. *Website:* https://nursing.uiowa.edu/cncce/nursing-outcomes-classification-overview
Home Health Care Classification (HHCC)	Diagnoses, interventions, and outcomes	Provide a structure for documenting and classifying home health and ambulatory care. Consists of two interrelated taxonomies: HHCC of Nursing Diagnoses and HHCC of Nursing Interventions. *Website:* http://www.sabacare.com
International Classification for Nursing Practice (ICNP)	Diagnoses, interventions, and outcomes	Capture nursing's contributions to health and provide a framework into which existing vocabularies and classifications can be cross-mapped, enabling comparison of nursing data from various countries throughout the world. *Website:* https://www.icn.ch/what-we-do/projects/ehealth-icnp/about-icnp
Systematized Nomenclature of Medicine—Clinical Terms (SNOMED CT)	Comprehensive clinical terminology	Integrate, link, and map terms from various disciplines such as medicine, nursing, and occupational therapy. *Website:* https://www.nlm.nih.gov/healthit/snomedct/index.html

Source: Adapted with permission from Alfaro-LeFevre, R. (2014). *Applying nursing process: A tool for critical thinking* (8th ed., p. 100). Wolters Kluwer/Lippincott Williams & Wilkins.

Concept Mastery Alert

During the evaluation phase, the nurse reviews the patient's outcome attainment and determines if outcomes have been met, partially met, or not met. Evidence interpretation is more associated with the diagnosing/problem identification phase.

Dynamic

Although the nursing process is presented as an orderly progression of phases, in reality, there is great interaction and overlapping among the five phases. No single phase in the nursing process is a one-time phenomenon; each phase flows into the next. In some nursing situations, all five phases occur almost simultaneously.

Interpersonal

Always at the heart of nursing is the human being. Read one student's account of this truth in the accompanying Through the Eyes of a Student feature (on page 368). The nursing process ensures that nurses are person centered rather than task centered (Fig. 13-7). Rather than simply approaching a patient to take vital signs, the nurse might ask, "How are you today, Mr. Byrd? Are we helping you to achieve your goals? What are the most important things you would like to accomplish today? [or] What are the most important things you would like us to work on today?" The nurse might also consider any new data that indicate a need to modify the patient's plan of care.

Through the Eyes of a Student

My first experience with an open wound was with a woman who had a stage IV sacral decubitus. I needed to do a dressing change with packing. I was fearful of what the wound would look like. I thought for sure I was going to be "grossed out," and I was—not by the appearance of the wound, but by the odor. The stench was awful! I started to feel queasy and began to sweat, and I thought I was going to pass out and fall right over on the patient. While I was packing the wound, I kept thinking that I was never going to get out of that room. I looked over at my clinical instructor and searched her face for approval of my technique, and I wondered if she also smelled anything and if it was making her feel sick too!

After the procedure was over and I left the room, I asked my instructor if all wounds smell that awful and would the smell always make me feel sick. Her response was that sometimes an odor will be really bad, and it might make me feel sick. With this kind of reassurance, I thought this is it—I never want to smell that again, and no way do I want to be a nurse.

Later, I realized that I had forgotten there was someone else in that room: the patient. She had to stay in there with that wound and its odor. It was for this reason I changed my mind about leaving nursing. I remembered that it was wanting to help patients to deal with their wounds that made me decide to be a nurse in the first place.

—Barbara L. Dlugosz

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Holy Family University, Philadelphia, PA

FIGURE 13-7. Nurses focus on people, not problems or tasks. The nursing process is thoughtful and person centered, not task centered.

Consider **Charlotte Horvath**, the single mother who requires wound care teaching but has failed to attend any scheduled teaching sessions. A nurse who values the interpersonal dimensions of nursing would investigate with Ms. Horvath the reasons underlying her inability to make the teaching sessions. This investigation may reveal many reasons, such as an inability to get away from work, fear, feelings of being overwhelmed, or lack of awareness about the importance of the wound care.

The nursing process encourages nurses to work together to help patients use their strengths to meet all their human health needs. This is different from viewing the patient as a "problem to be solved" and interacting mechanically to provide the solution. Working intimately with patients helps nurses to explore their own strengths and limitations and to develop themselves personally and professionally.

Outcome Oriented

The nursing process offers a means for nurses and patients to work together to identify specific outcomes related to health promotion, disease and illness prevention, health restoration, and coping with altered functioning; to determine which outcomes are most important to the patient; and to match them with the appropriate evidence-based nursing actions. When these outcomes are recorded in the care plan and prioritized, each nurse can quickly determine the patient's priorities and begin nursing with a clear sense of how to proceed. The patient benefits from continuity of care, and each nurse's care moves the patient closer to outcome achievement.

Universally Applicable in Nursing Situations

The one constant in health care is change. When nurses have a working knowledge of the nursing process, they find that they can practice nursing with well or ill people, young or old, in any type of practice setting. Mastering the nursing process gives you a valuable tool you can use with ease in any nursing situation.

It should be clear from this discussion that the nursing process provides a framework for all the nurse's activities. In each nurse–patient interaction, it is important to assess the patient, note any significant alterations in health status, determine whether the nursing action is helping the patient achieve their goals, and modify the care plan as necessary. Thus, the nurse who feeds a child through a special tube as ordered by a health care provider continually assesses how the child is responding to the feeding and whether the child or family will be able to manage the feedings independently when the child is discharged. Depending on the results of the nursing assessment, new diagnoses or problems may be indicated, along with related additions to the plan of care. The nursing process offers direction for all the activities carried out by the nurse when caring for patients.

Documenting the Nursing Process

The ability to communicate clearly is a critical nursing skill. Accurate, concise, timely, and relevant documentation provides all the members of the caregiving team with a picture of the patient. The patient record is the chief means of communication among members of the interdisciplinary team. Legally speaking, a nursing action that was not documented was not performed. If accused of negligent care, a nurse might tell the court of having faithfully assessed the patient's needs, diagnosed problems, and implemented and evaluated an effective care plan. However, unless the patient's health records contain documentation supporting these claims, the court has no reason to accept the nurse's word rather than that of the patient or family who are claiming that such care was not given.

Each chapter in this unit offers specific documentation guidelines for nursing process activities; Chapter 20 discusses documentation in general. It is helpful to practice documentation while learning any given nursing activity; like any other nursing skill, documentation improves with practice. Examples of nursing documentation, nursing assessments, plans of care, and notes are provided throughout this text.

Box 13-8 **Example of the Nursing Process in Action**

Assessing

You are checking on a patient who had abdominal surgery yesterday and hear that the patient has considerable pain: "It kept me up all night." The patient has been reluctant to ask for any pain medication, fearing effects of the drug. "I don't want to become a junkie." The patient's blood pressure and pulse rate are slightly elevated.

Diagnosing/Problem Identification

You analyze the data just described and identify pain/discomfort as a problem. The patient agrees that this is becoming a problem.

Outcome Identification and Planning

You decide to work with the patient to achieve the outcome: *By 1500, patient reports sufficient relief of pain to enable him to rest and to get out of bed to go to the bathroom.* The patient wants to accomplish the outcome. You identify teaching as the primary evidence-based nursing intervention.

Implementing

After asking the patient about his experiences with pain-relieving medications, you explain that although many of these drugs are addictive when misused, there is no harm if they are taken as prescribed postoperatively. You also explain that it is important for him to experience enough pain relief to be able to cough and deep breathe, ambulate, and do other things important to his recovery. You suggest that the medication will be most effective if taken before his pain peaks and becomes intense. You administer the prescribed medication for pain when the patient indicates that he is willing to give it a try.

Evaluating

After enough time has elapsed for the medication to take effect, you check back with the patient to evaluate whether he has obtained relief and met his outcome. If the patient is satisfied and you both feel that comfort is no longer a problem, you terminate the care plan for this diagnosis. If the patient still feels pain or is dissatisfied with the medication, each of the preceding steps of the nursing process is reevaluated, and necessary changes are made in the care plan.

Benefits of the Nursing Process

When used well, the nursing process achieves for the patient scientifically based, holistic, individualized care; the opportunity to work collaboratively with nurses and other team members; and continuity of care. Nurses who use the nursing process in a thoughtful and systematic way achieve a clear, efficient, and cost-effective plan of action by which the entire nursing team can achieve the best results for patients; the satisfaction that they are making an important difference in the lives of their patients; and the opportunity to grow professionally as they evaluate the effectiveness of interventions and variables that contribute positively or negatively to the patient's achievement of valued outcomes. See Box 13-8 for an example of the nursing process in action. The accompanying Promoting Health Literacy box is another example of how nurses can make a difference.

Promoting Health Literacy

IN PATIENTS AND FAMILIES WITH ASTHMA

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

Patient Scenario

Your mom calls to tell you that your neighbor back home spent the night in the emergency department with her 3-year-old son Bobby, whom you used to baby-sit. When Bobby experienced chest tightness and shortness of breath, his pediatrician recommended a quick trip to the local emergency department. For the present, Bobby's parents are comforted that he was able to be discharged and is now breathing easier. They were terrified, however, to learn that he may have asthma and wanted your opinion on what they should do. They have an appointment scheduled with their pediatrician.

Nursing Considerations: *Tips for Improving Health Literacy*

Call Bobby's mom and give her an information sheet about childhood asthma and tips on finding out more information about the disease online from a credible source. Explain that it is a potentially serious disorder if not treated properly, but with good management children are able to sleep, learn, and play. Encourage her to follow the pediatrician's recommendations and to be prepared to ask her pediatrician three questions:

- What is Bobby's main problem?
- What do they need to do?
- Why is it important for them to do this?

What additional measures can you take to help increase health literacy in this patient/family? What other measures would be helpful if Bobby's parents do not speak English, cannot read, or have learning difficulties?

Evaluating the Use of the Nursing Process

The primary purpose of the nursing process is to help nurses committed to thoughtful, person-centered practice manage each patient's care scientifically, holistically, and creatively. To do this successfully, the nurse needs the correct personal attributes, a sound knowledge base, and many competencies, along with the willingness to use them creatively and critically when working with patients to promote or restore health, prevent disease or illness, and facilitate coping with altered functioning.

Box 13-9 Checklist for Evaluating Your Use of the Nursing Process

Assessing

- ☐ The initial database is obtained by means of a nursing history and nursing examination.
- ☐ Assessment data are documented:
  - ☐ Accurately—Questionable data are validated.
  - ☐ Completely—Use of a systematic guide ensures that recorded data describe (1) the patient's functional ability to meet each basic human need, and (2) responses to health and illness.
  - ☐ Concisely—Irrelevant data and meaningless generalizations are avoided.
  - ☐ Factually—Patient behaviors are recorded rather than the nurse's interpretation of these behaviors.
  - ☐ Timely—Current data are recorded for the team.
- ☐ The initial database communicates a "real sense" of the patient that makes possible individualized care.
- ☐ Focused assessment data are recorded for each patient problem.
- ☐ Data collection and documentation are ongoing and responsive to changes in the patient's condition.

Diagnosing/Problem Identification

- ☐ A prioritized list of actual or potential health problems and needs is in the care plan.
- ☐ Each problem statement:
  - ☐ Is derived from an accurate and validated interpretation of a cluster of significant patient data or "cues"
  - ☐ Contains a precise problem statement describing what is unhealthy about the patient and what needs to change—suggests patient goals
  - ☐ Identifies factors that contribute to the problem (etiology)—these suggest nursing interventions
  - ☐ Uses nonjudgmental language and is written using legally advisable terms
- ☐ Each problem is compatible with institution/agency guidelines.
- ☐ Old problems are deleted from the care plan once resolved, and new problems are added as soon as identified.

Outcome Identification and Planning

- ☐ A comprehensive, individualized, and up-to-date care plan that specifies patient outcomes and nursing

orders for each diagnosis/problem is developed with the assistance of the patient and family.

- Planning is comprehensive:
  - Initial
  - Ongoing
  - Discharge
- Long-term goals alert the entire nursing team to realistic patient expectations after discharge.
- Short-term outcomes:
  - When achieved, demonstrate a resolution of the patient problem
  - Describe a single, observable, and measurable patient behavior
  - Are valued by the patient and family
  - Are realistic in terms of the resources of the patient and the nurse
- Nursing orders:
  - Clearly and concisely describe the nursing intervention to be performed (ongoing assessment; nursing treatments and procedures; teaching, counseling, advocacy)
  - Are individualized to the patient
  - Are consistent with standards of care and supportive of other therapies/evidence-based practice
  - Are effective in accomplishing the desired patient outcomes
- The care plan encourages patient and family participation.

Implementing

- The patient record contains daily documentation of the nursing measures used to (1) assist the patient to meet basic human needs, (2) resolve health problems, and (3) implement select aspects of the medical care plan.
- The care plan is implemented:
  - Competently
  - Confidently
  - Responsibly
  - Caringly
  - Creatively

Evaluating

- Evaluative statements are recorded on the care plan to document the patient's level of outcome achievement at targeted times.
- Ongoing evaluation of the patient's responses to the care plan is used to make decisions about terminating, continuing, or modifying nursing care.

The chapters that follow in this unit describe each step of the nursing process in detail. As a student nurse beginning to use the nursing process, you should evaluate your growing skill in using the nursing process correctly. The assessment tool in Box 13-9 will help you assess your proficiency in the skills essential for competent use of the nursing process. After completing the exercise, share your self-evaluation with a trusted colleague or clinical instructor and see whether your assessment of your abilities agrees with your colleague's or instructor's assessment. Celebrate your natural and developed strengths. Begin now to plan a strategy to boost those skills in which you are deficient. It may sound trite, but it is true: Your patients will be grateful you cared enough to be your best. Nurses sensitive to mastering both the art and the science of thoughtful, person-centered practice evaluate whether they have the prerequisite skills for each nurse–patient encounter, as well as the skills needed to perceive, respond to, and appreciate the uniqueness of each patient. Quality care is each nurse's responsibility.

Concept Mapping

Concept mapping is an instructional strategy in which learners identify, graphically display in a diagram or drawing, and identify interrelationships between core concepts. Concept maps—also called cognitive maps, mind maps, and metacognitive tools for learning—are a proven means to promote critical thinking and self-directed learning. They allow for a visual picture of the internal processes nurses use in critical thinking and relationship analysis. Be alert … your concept maps offer your instructor a key visual about how your brain is working and your developing ability to link related concepts.

Schmehl (2014, p. 3) articulates that "concept mapping, as it is used in nursing, serves as a pathway to the intersection of critical thinking and theory-to-practice application." Concepts maps assist nursing students in designing a care plan based on the individual patient concerns and problems. Using a concept map promotes critical thinking, the ability to recognize relationships and connection between data, and the ability to apply this knowledge to patient care (Schmehl, 2014).

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

There are many excellent resources that discuss different ways to approach concept mapping. Schuster (2016) uses boxes to cluster, organize, and link information.

According to Schmehl (2014), the basic steps in concept map care planning are as follows:

. *Collect patient problems and concerns on a list*. Remember that this list can include a symptom, a lab value, a diagnostic test result, a treatment, or collaborative care concerns. These data can be obtained by you from the assessment, from the patient directly, from the medical record, and from interactions with the interprofessional team.
. *Connect and analyze the relationships*, differentiating between groupings of main and related problems. Take time to question, compare, contrast, and group your data.
. *Create a diagram* demonstrating problem recognition, critical thinking, and nursing actions. Use shapes, connecting lines, descriptive phrases, and learning styles to emphasize nursing actions related to the care plan. As your concept maps become more complex, use a key with your diagram to keep track of what each box, link, shape, or color represents. Keep in mind that creativity is encouraged; no two maps will look the same!
. *Keep in mind key concepts*: the nursing process, holism, safety, and advocacy.

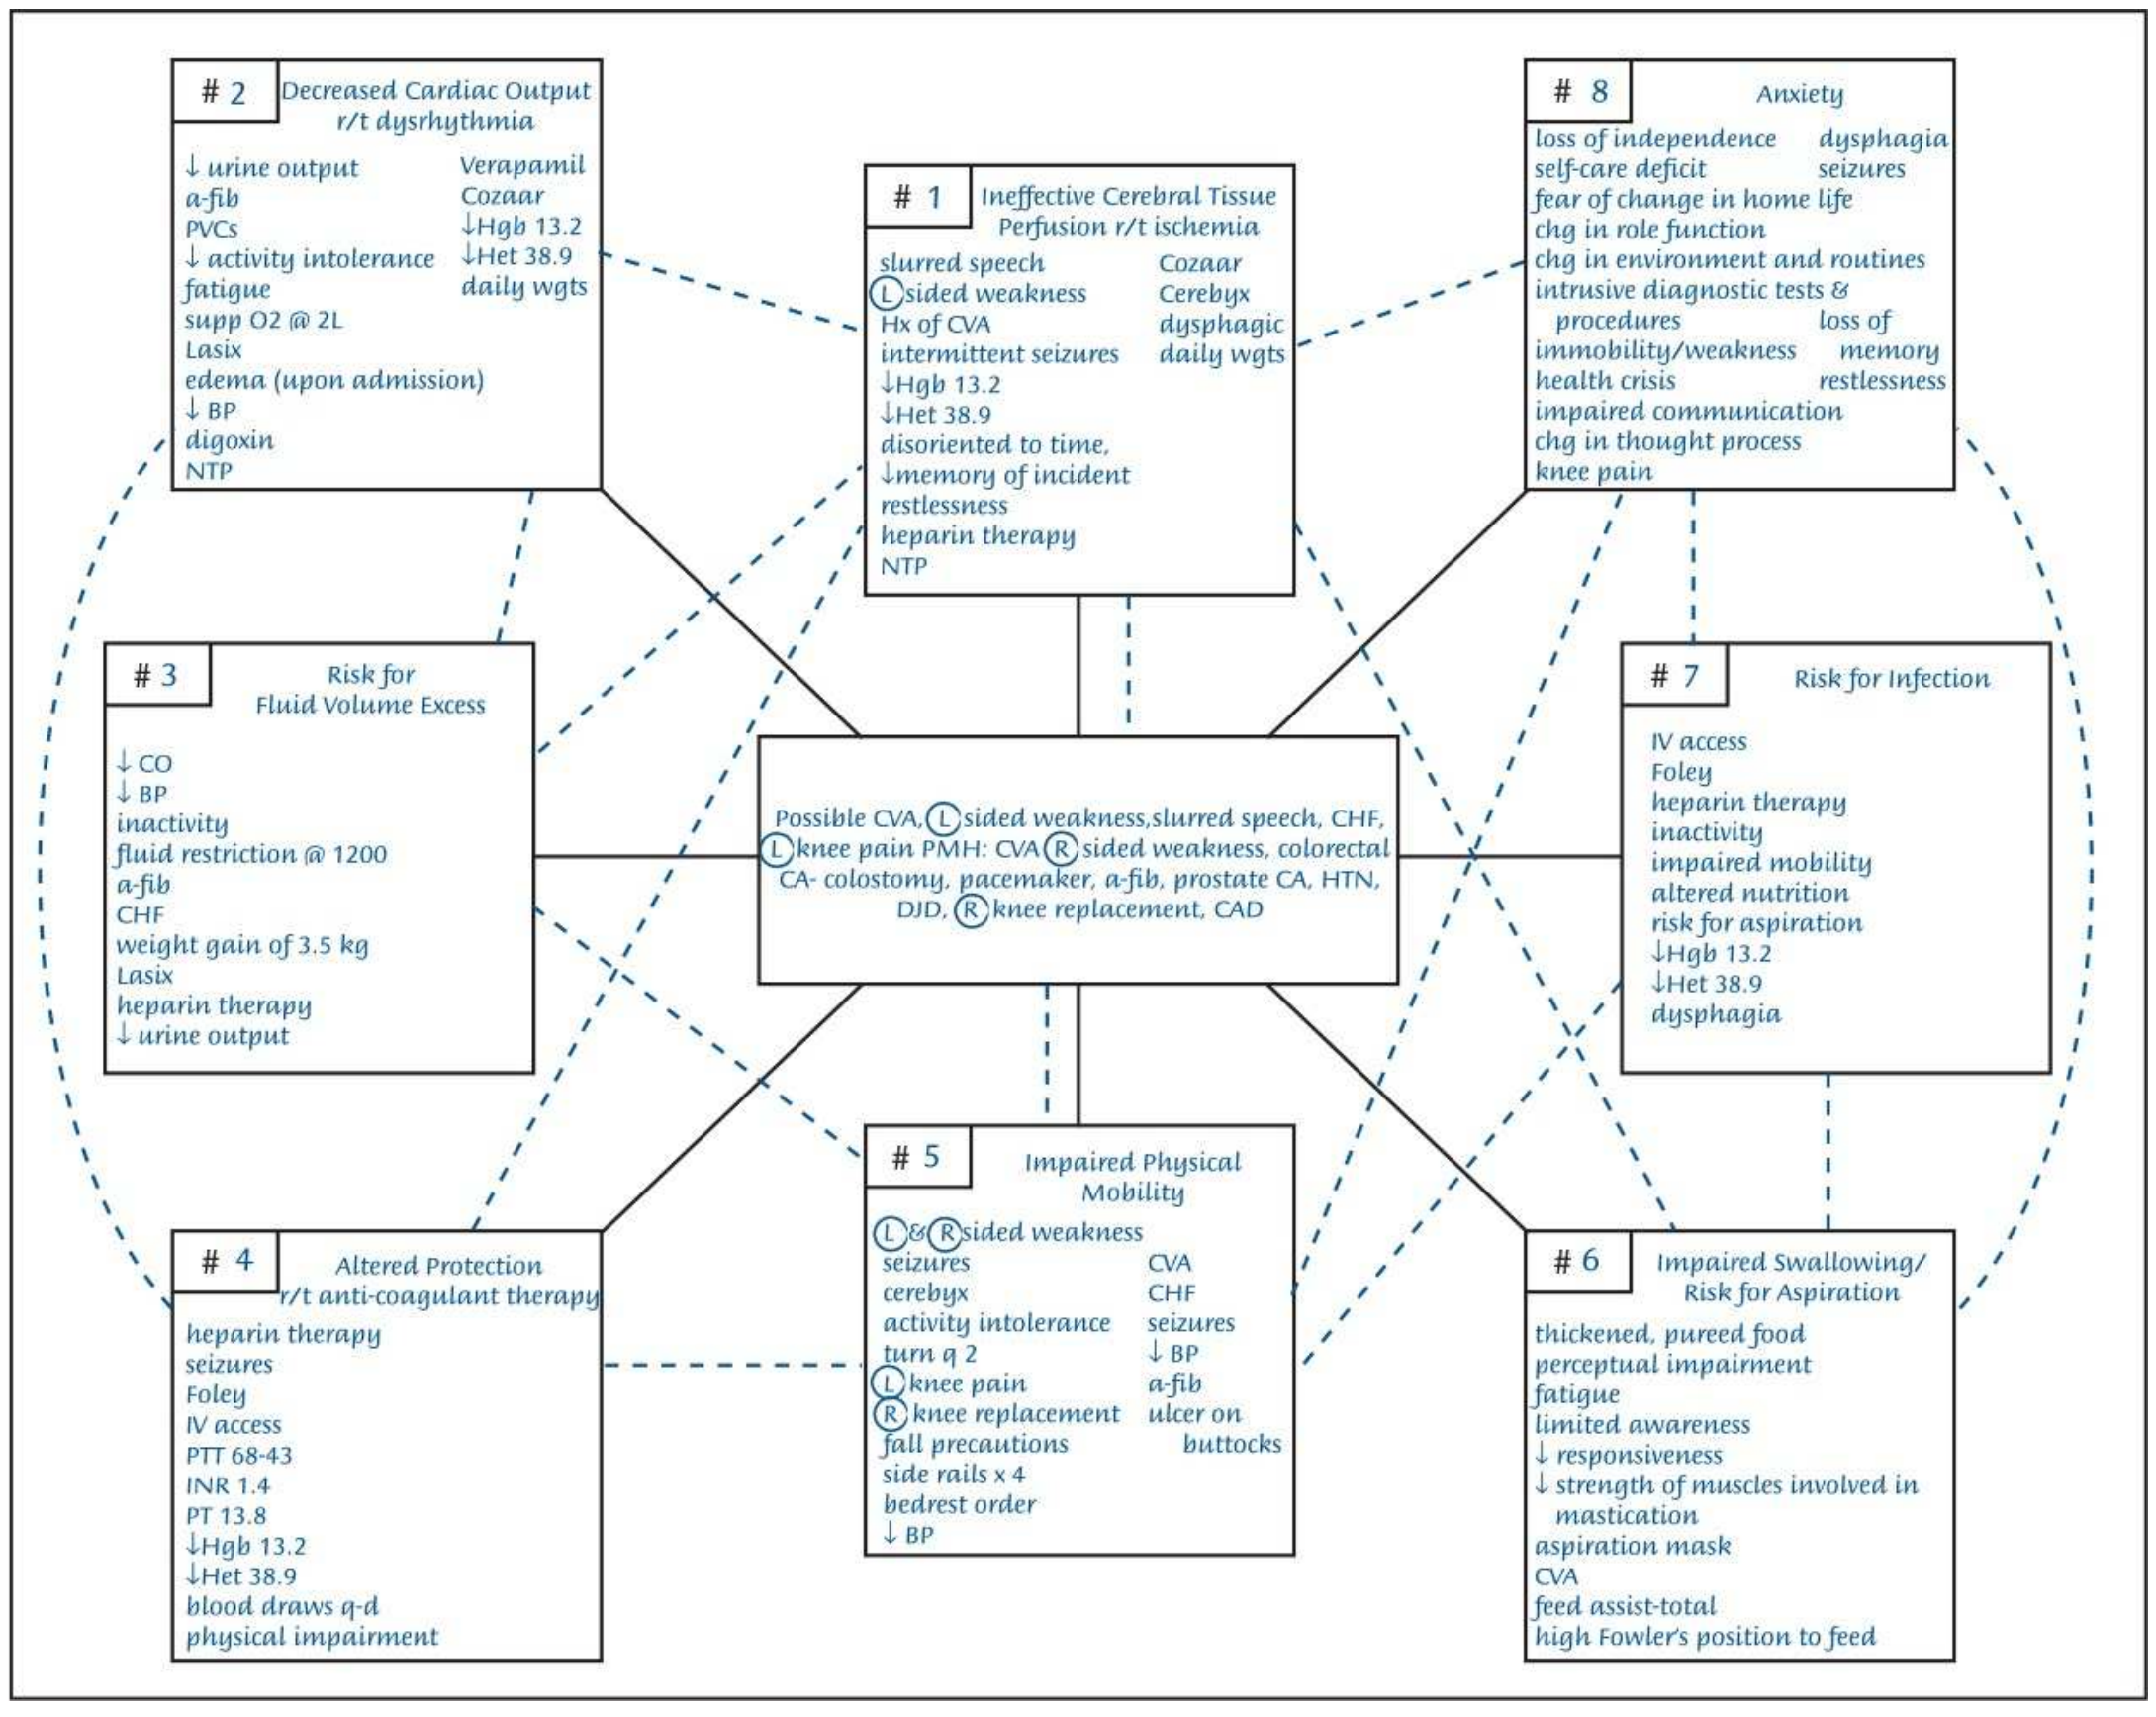
Figure 13-8 (on pages 372–376) presents examples of concept maps prepared by a student with the related patient database problem list forms. Simple concept maps demonstrating the nursing process for featured patients can be found in Chapters 31, 33, 34, 40, 41, and 45.

REFLECTIVE PRACTICE

Reflection is a normal human activity. We frequently think about what has just happened and how it has affected us, but often this reflection is superficial. **Reflective practice** is a purposeful activity that leads to action, improvement of practice, and better patient outcomes. It is about looking at an event, understanding it, and learning from it. Learning from reflection is not automatic; it requires a deeper understanding of how and why reflection contributes to the competence of the effective nurse. Schön (1983) has identified three types of reflection.

. *Reflection in action* happens in the here and now of the activity and is also known as "thinking on your feet."
. *Reflection on action* occurs after the fact and involves thinking through a situation that has occurred in the past. It is used as a means of evaluating the experience and deciding what could have been done differently.
. *Reflection for action* is the desired outcome of the first two types of reflection: it helps the person to think about how future actions might change as a result of the reflection.

Gibbs's model of reflective practice (1988) is used by many nurses to learn from and improve their practice (Table 13-5 on page 377).



Suppose the nursing student caring for **Addie Warner** mistakenly gives her the medications she was supposed to give to another patient. She can use the critical reflection in action through the critical incident analysis described in Table 13-6 (on page 377) to learn from this experience.

Try to identify a recent situation that left you feeling disappointed in yourself. Then use Gibbs's reflective cycle questions to analyze what happened so that you can use what you learned about yourself to guide future experiences.

Nurses who are sincerely committed to thoughtful, person-centered care learn early to make reflection and self-evaluation an integral part of their nursing practice. Self-evaluation skills promote professional development, enhance self-esteem, and help you develop self-awareness. The Reflective Practice exercises in each chapter illustrate this practice. Each exercise describes a particular challenge to the student's competence, a range of possible responses, the criteria the student used to evaluate a good response, and a brief statement about what the student learned from this experience. A nurse who is just beginning to develop in the caregiver role may find it helpful to conclude each caregiving experience with a brief moment of reflection that identifies and celebrates the nursing skills used and targets skills that still need to be developed. This practice can keep you from feeling overwhelmed by everything that remains to be mastered and yet strongly motivated to learn new skills.

DEVELOPING CLINICAL REASONING AND CLINICAL JUDGMENT

. A nursing student realizes that her college roommate's behavior has changed dramatically during the past month. Once outgoing and funny, the roommate is now withdrawn and moody, rebuffing efforts to discuss her behavior changes. Compare and contrast the processes and likely outcomes of using different methods of problem solving (trial-and-error, scientific, intuitive) and the nursing process to address the roommate's needs.

Problem #1 *Ineffective Cerebral Tissue Perfusion r/t ischemia (thrombosis)*
Short-term Goal: *Cerebral perfusion pressure will be maintained during hospital stay.*
Long-term Goal: *Pt will participate in rehabilitation exercises to regain optimal strength in (L) extremities.*

Nursing Interventions:	Patient's Response:
1. Monitor VS q 4, check pupils	1. BP 112/60, T97, P66, RR16, PEARL @ 0800
2. Monitor I & O strict q shift.	2. BP 94/60, T97, P70, RR18, PEARL @ 1200
3. Monitor pulse Ox q shift	3. Pt on restricted 1200 cc fluids po, 5 hr intake=480, SAO_2 99% on 2L NC.
4. Keep head of bed 30 or lower (except when feeding)	4. Pt responsive to verbal stimuli, oriented to person & place.
5. Cluster activities to ↓ ICP.	5. Pt tolerated assessment, bath and feeding before tiring.
6. Administer heparin infusion.	6. Pts PTT 68 to 43.

Summarize your impressions of patient progress towards goals *Pt displays Ø worsening of symptoms of reduced of cerebral perfusion. Continue interventions.*

Problem #2 *Decreased Cardiac Output r/t dysrhythmia*
Short-term Goal: *Pt will maintain optimally compensated cardiac output evidenced by clear lung sounds, Ø SOB, increased urine output on ↑activity tolerance while hospitalized.*
Long-term Goal: *Pt will comply c̄ medication regimen to maintain optimal cardiac output after discharge.*

Nursing Interventions:	Patient's Response:
1. Assess rate & quality of apical & peripheral pulses.	1. Pulses palpable +2, apical rate S_1S_2 c murmur; Ø pulse deficit.
2. Assess BP q 4	2. BP 112/60 @ 0800, 94/80 @ 1200.
3. Assess lung sounds q 2	3. Lungs clear but decreased in bases bilaterally.
4. Assess urine output.	4. Urine output 50 cc/hr (250 in 5 hrs)
5. Assess SAO_2.	5. Pt SAO_2 99% c 2L O_2 via nc.
6. Weigh pt daily.	6. Pt has gained 3.5 kg from 2/24 to 2/27.

Summarize your impressions of patient progress towards goals *Pt is maintaining good cardiac output as evidenced by ↑ urine output, clear lung sounds and ↓ edema. Continue interventions.*

Problem #3 *Risk for Fluid Volume Excess*
Short-term Goal: *Pt will maintain optimal fluid balance as evidenced by stable wgt, clear lung sounds, Ø edema and adequate urine output.*
Long-term Goal: *Pt will maintain fluid balance upon discharge by compliance c̄ medication regimen and fluid intake.*

Nursing Interventions:	Patient's Response:
1. Weigh pt daily.	1. Pt gained 3.5 kg since admission.
2. Monitor strict I & O (1200 cc/24 hr)	2. Pt's intake was 480, output 250 in 5 hrs.
3. Evaluate urine output.	3. Urine output is 50 cc/hr for 5 hrs (0800—1300)
4. Administer Lasix as ordered.	4. Lasix given @ 1000 40 mg po.
5. Monitor electrolytes (side effect of diuretic)	5. All electrolytes WNL.
6. Assess for edema.	6. Ø edema present.

Summarize your impressions of patient progress towards goals *Pt is maintaining optimum fluid balance presently c̄ exception of wgt gain. Continue interventions.*

Problem #4 *Altered Protection r/t anticoagulant therapy*
Short-term Goal: *Pt will maintain therapeutic blood level of anticoagulant as evidenced by PTT, PT and INR WNL.*
Long-term Goal: *Pt will set up schedule for bloodwork to be drawn after discharge to maintain therapeutic levels.*

Nursing Interventions:	Patient's Response:
1. Monitor pt for adverse effects to anti-coagulant.	1. Pt shows Ø signs of unexplained bleeding– Ø bruising, Ø petechic.
2. Monitor vs q 4.	2. Pts BP 112/60, T978, P66, RR16 @ 0800, 94/60, T974, P20, RR18@1200.
3. Ensure IV infusion & site is uninterrupted.	3. Heparin infusing s̄ incident, IV site shows Ø signs of inflammation or bleeding.
4. Monitor lab results of PTT, PT, INR and intact.	4. Pts PTT 68 to 43, PT 13.8, INR 1.4.
5. Monitor Hgb & Het for internal bleeding.	5. Hgb ↓ 13.2, Het 38.9 ↓

Summarize your impressions of patient progress towards goals *Pt currently shows Ø signs of bleeding caused by anti-coagulant therapy. Continue to monitor –check H&H to see if continues downward trend. Continue interventions.*

Problem #5 *Impaired Physical Mobility*
Short-term Goal: *Pt will maintain maximum level of function and risk of complications will be reduced while hospitalized.*
Long-term Goal: *Pt will regain optimal level of functioning as dictated by severity of CVA.*

Nursing Interventions:	Patient's Response:
1. Assess pt's degree of weakness in both upper & lower extremities.	1. Pt's (L) side shows ↑ weakness to (R) side.
2. Determine active & passive ROM capabilities.	2. Pt can move (R) arm independently, other extremities require passive ROM.
3. Monitor skin integrity for potential breakdown.	3. Pt's skin intact c̄ exception of (L) buttock -opaque dsg- cannot assess.
4. Change pt's position q 2.	4. Pt appears comfortable, Ø breakdown present.
5. Use pressure relieving devices to ↓ stress.	5. Placed pillows under legs to elevate heels, pillow under (R) or (L) side to ↓ pressure on sacrum.
6. Implement fall precautions for pt safety.	6. Side rails x 4, bed in low, locked position.

Summarize your impressions of patient progress towards goals *Pt has Ø falls. Pt shows Ø skin breakdown and passive ROM performed on lower extremities & (L) arm. Continue interventions.*

Problem #6 *Impaired Swallowing/Risk for Aspiration*
Short-term Goal: *Pt will not experience aspiration while hospitalized.*
Long-term Goal: *Pt will maintain adequate nutrition, as evidenced by stable wgt and albumin WNL.*

Nursing Interventions:	Patient's Response:
1. Before mealtime, provide adequate rest periods.	1. Pt was able to stay alert through meal.
2. Provide oral care before feeding.	2. Pt's mouth moistened, displayed good appetite.
3. Place pt in high Fowler's position for feeding.	3. Pt swallowed and chewed well.
4. Prompt pt to chew/swallow.	4. Pt responsive to prompts.
5. Identity food given to pt before each mouthful.	5. Pt nodded recognition- frowned to display distaste.
6. Crush pills and place in pureed food.	6. Pt took all medications s̄ incident

Summarize your impressions of patient progress towards goals *Pt did not aspirate and completed 75% of meals. Continue interventions.*

Problem #7 *Risk for Infection*
Short-term Goal: *Pt will remain free of infection as evidenced by VS WNL, Ø purulent drainage from tubes.*
Long-term Goal: *Pt will remain free of infection post discharge.*

Nursing Interventions:	Patient's Response:
1. Monitor VS q 4.	1. VS WNL: Temp 97, HR66
2. Monitor WBC.	2. WBC WNL - 9.2.
3. Monitor pt for S & S of infection.	3. Pt shows Ø S & S of inflammation, swelling, drainage at any IV site.
4. Practice aseptic technique at all times.	4. Pt remains free of infection.
5. Monitor appearance of urine.	5. Pt's urine is dark, amber color. MD notified. Culture ordered.
6. Encourage intake of protein & calorie rich foods.	6. Pt completes app. 75% of food offered.

Summarize your impressions of patient progress towards goals *Pt has remained free of S/S of infection—awaiting results of urine culture. Continue interventions.*

Problem #8 *Anxiety*
Short-term Goal: *Pt will demonstrate a reduced level of anxiety evidenced by ↓ seizures, ↓ restlessness.*
Long-term Goal: *Pt will demonstrate positive coping mechanisms.*

Nursing Interventions:	Patient's Response:
1. Acknowledge awareness of pt's anxiety.	1. Pt appeared grateful, nodded affirmatively.
2. Maintain a calm manner c̄ pt.	2. Pt appears calm and responsive.
3. Maintain frequent contact c̄ pt.	3. Pt demonstrates recognition when I appear.
4. Use simple language & brief statements to explain procedures & tasks.	4. Pt followed commands appropriately.
5. Reduce sensory stimuli.	5. Pt appears calm and resting comfortably.

Summarize your impressions of patient progress towards goals *Pt is experiencing less restlessness and appears more comfortable c̄ environment. Continue interventions.*

Table 13-5 Gibbs's Model of Reflection

Description	What happened? Don't make judgments yet or try to draw conclusions; simply describe.
Feelings	What were your reactions and feelings? Again, don't move to analyzing these yet.
Evaluation	What was bad or good about the experience? Make value judgments.
Analysis	What sense can you make of the situation? Bring in ideas from outside the experience to help you. What was really going on?

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

	Were different people's experiences similar or different in important ways?
Conclusions (general)	What can be concluded, in a general sense, from these experiences and the analyses you have undertaken?
Conclusions (specific)	What can be concluded about your own specific, unique, personal situation or way of working?
Personal Action Plan	What are you going to do differently in this type of situation next time? What steps are you going to take on the basis of what you have learned?

Table 13-6 Critical Reflection in Action Through Critical Incident Analysis

REFLECTIVE PRACTICE	REFLECTIVE QUESTIONS	LEARNING
Self-awareness These questions are aimed at helping the nursing student to become more aware of self.	What was my role in the incident?	I gave the drug to the wrong patient. The drug was meant for my second patient—not Addie Warner. I was in a rush and did not check the eleven rights of drug administration.
	What did I learn about myself?	When I am in a rush I take shortcuts.
Reflection These questions are aimed at helping the student to identify deficits in knowledge and the actions or inactions that contributed to the situation.	What circumstances may have contributed to my error?	The unit was very busy and I was already behind on my work and trying to do three things at once. I asked someone to check the drug with me, but I knew they were also busy and not focused on the task at hand.
	Were there any knowledge deficits that contributed to my error? If so, how might I overcome these?	I already knew the eleven rights but did not check them, so the deficit relates to acting on my knowledge rather than a lack of knowledge.
	Were there any environmental issues that may have contributed to the error occurring?	This patient had been so demanding all morning that she certainly had me "on edge" and worried about finishing all I had to do before needing to leave the floor for post-conference.
	What did I learn from the incident?	This reinforced the importance of checking and also of my role in safe administration of medication. I also learned why I can't let demanding patients "rattle" me. Luckily the patient did not suffer an adverse reaction, but it did make me stop and think about my practice.
	How might I act differently in the future?	I will think about the patient first and ensure I am not rushed during drug administration. I will ask for help.

. The nursing process is an interpersonal process that is always person centered rather than task centered. Discuss with other students the meaning of this claim. Think through and discuss the implications of approaching patients as "problems to be solved" rather than as unique human beings with inherent dignity.
. Describe how you would structure an assessment of the following situation, using critical-thinking considerations: purpose of thinking, adequacy of knowledge, potential problems, helpful resources, and critique of judgment/decision.
A 28-year-old woman is admitted to a hospital for multiple contusions and a hairline fracture of the skull. She claims that she "fell down the steps," but on examination, several of the injuries seem inconsistent with a fall. The woman sticks to her story that her fall was an accident. You are her nurse.
Assess whether your attitudes and dispositions would help or hinder the task of critical thinking if you were the nurse in this situation. Share your self-evaluation with another student and compare your responses.
. Using the just-described scenario, identify the cognitive, technical, interpersonal, and ethical and legal skills you would need to meet the nursing needs of this woman. If possible, compare your list with that of an experienced nurse and discuss differences.

PRACTICING FOR NCLEX

. A nursing student is committed to providing thoughtful, person-centered care. Which nursing actions demonstrate this type of care? Select all that apply.

a. Assisting patients to select meals based on their cultural observances
b. Providing nursing care based on patients' needs and preferences
c. Documenting nursing interventions in the electronic health record
d. Reviewing fingerstick blood glucose levels with the primary nurse
e. Listening to a patient's concern for their ill significant other

. A patient who is receiving cancer chemotherapy tells the nurse, "The treatment for this cancer is worse than the disease itself. I'm stopping treatment." Which nursing action best promotes a patient-centered, therapeutic relationship?

a. Determining if the patient database is adequate to address the problem
b. Considering whether to suggest a counseling session for the patient
c. Reassessing the patient and determining how to best support them
d. Identifying possible interventions and critiquing the merit of each option

. The nursing philosophy in an acute care hospital includes a commitment to deliver thoughtful, person-centered care. Which description of the nursing process best supports this commitment?

a. Systematic
b. Interpersonal
c. Dynamic
d. Universally applicable in nursing situations

. A staff nurse tells a new graduate nurse not to bother studying too hard, since most clinical reasoning becomes second nature and intuitive once they begin practicing. Which response by the student is appropriate?

a. Intuitive problem solving comes with years of practice and observation based on nursing knowledge and science.
b. For nursing to remain a science, nurses must continue to be vigilant about avoiding intuitive reasoning.
c. The emphasis on logical, scientific, evidence-based reasoning has held nursing back; we need intuitive, creative thinkers.
d. The nurse's preference dictates whether they are logical, scientific thinkers or intuitive, creative thinkers.

. The nurse uses blended competencies when caring for patients in a rehabilitation facility. Which interventions reflect the use of cognitive skills? Select all that apply.

a. Monitoring for side effects of medications
b. Safely administering an injectable medication
c. Teaching a patient about diabetes and its management
d. Acting as witness by signing a surgical consent form
e. Helping a patient identify their progress in physical therapy
f. Comforting a patient who has received bad news

. A nurse uses critical-thinking skills to develop the care plan for an older adult with dementia awaiting placement in a long-term care facility. Which statements describe characteristics of the critical thinking used by nurses engaged in clinical reasoning? Select all that apply.

for more ebook/ testbank/ solution manuals requests: email 960126734@qq.com

a. Functions independently of nursing standards, ethics, and state practice acts
b. Based on the principles of the nursing process, problem solving, and the scientific method
c. Driven by patient, family, and community needs as well as nurses' needs to give competent, efficient care
d. Avoids designs to compensate for problems created by human nature, such as medication errors
e. Constantly reevaluating, self-correcting, and striving for improvement
f. Focuses on the big picture rather than identifying the key problems, issues, and risks involved with patient care

. A nurse is caring for a patient with type 2 diabetes who has an infected foot ulcer requiring dressing changes. Which nursing action best demonstrates the QSEN competency of patient-centered care?
a. Asking the patient if they would like their spouse to be present for a teaching session
b. Researching new procedures to care for foot ulcers when developing a care plan for this patient
c. Leading a grand rounds or unit-based discussion on complications of diabetes
